Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ON several recent occasions we have referred to the efforts being made to instruct soldiers and naval men in various occupations and handicrafts. This work is being satisfactorily developed, and apparently the occupation of the chauffeur is finding considerable acceptance among those who have served their country on land or sea. Special training has been given at military and naval centres, and although it is not yet possible to estimate how far the motor instruction has led to permanent employment, the first impression is that many men have obtained good positions and are doing satisfactorily. During the past year 271 men have been trained as motor-car drivers in the Army Schools, and the Committee of the War Office which has supervised the training appears to be well satisfied with the result of this interesting effort to equip men for civilian employment when they leave the service.

The International Automobile Conference.

THE most momentous decision of the congress of delegates of national automobile clubs, held in Paris on Monday, was that which allows the use in the A.C.F. Grand Prix and other international races during 1909 of detachable wheels as well as removable rims. There has during the past year or so been a good deal of discussion on the point, the A.C.F. in particular having been adverse to allowing detachable wheels. The matter was brought forward on Monday by the R.A.C. delegates, with the result already mentioned. Another matter dealt with at the meeting was the proposal of the Royal Automobile Club of Portugal to form a committee to consider means to bring about a uniform code of motoring regulations in the various countries of the world, this being agreed to. The Congress also considered a long-standing difficulty in connection with the recognition by one country of another country's "records," and the delegate of each of the national clubs represented undertook to make a trial of Col. Holden's electrical timing apparatus. The proposal that "records," when made, shall be automatically and electrically timed, and shall then be deemed "world's records," to be recognised by all the clubs comprised in the Association, was deferred to a subsequent meeting.

A Bad Impression Removed.

SEVERAL times have police witnesses suggested that motorists were in the habit of using unauthorised number plates on their cars. The statements have generally been untrue, and the discovery of a few isolated cases in which a wrongful use has been made of such identification marks has not warranted the wholesale condemnation of motorists which has sometimes been indulged in. We are glad, therefore, that the Motor Union recently caused inquiries to be addressed to the Chief Commissioner of Police for the Metropolis, and also the Chief Constables of Kent, Surrey and Sussex, asking to what extent they had found unauthorised number plates in use on motor-cars, and offering any assistance in the power of the motoring organisation to stop such an offence. The replies received

show that there is no reason to believe that the use of false number plates is at all common—an official assurance that should satisfy critics that motorists are no worse than other people.

Pathways for Pedestrians.

A PROMINENT public man in Sussex has been suggesting that the money extracted by magistrates from motorists might with advantage be allocated for the purpose of making footpaths by the side of the main roads. He suggested that the danger of being run down was now somewhat pronounced, and the provision of footways would not only give employment during the coming winter to those in need of it, but would also prove of public benefit to the community at large. The making up of footpaths on the highways is undoubtedly a matter of public convenience, if not of public safety, and proposals of a really practical character in such a connection should receive the careful consideration of the local authorities concerned.

A Motor Service in place of Railway.

At the beginning of last month the North British Railway Company curtailed the service in the Border towns by withdrawing the Sunday trains between Galashiels and Peebles, and the Sunday morning trains between Galashiels and Selkirk. As a result considerable inconvenience has been experienced, especially by week-end travellers, who had to be home to start work on Monday mornings. The Peebles Motor Company has now come to the rescue, and they are starting a Sunday service of motor-cars between Peebles and Selkirk, carrying passengers also between Innerleithen, Walkerburn, Clovenfords, and Galashiels. Cars will be run in the morning and evening, and the public will greatly appreciate the enterprise of the motor concern.

The Battle of the Seals.

THE practice which was introduced into the motor trade at the Olympia Show with reference to the collection of seals has received consideration from the Society of Motor Manufacturers and Traders, with the result that the following resolution on the subject has been adopted:—"That this meeting is of opinion that the system is calculated to produce most harmful results, and, in the best interests both of the trade and of users, it calls upon the suppliers of petrol to forthwith abandon the practice." This is undoubtedly the general view of all interested in the welfare of the industry.

Long Police Traps.

THOSE who thought that the East Sussex police had abandoned their ideas of timing motorists, because they had relinquished the short distance trap, have certainly imagined a vain thing, for the authorities in that district have developed the system of long distance "controls" for seven or ten miles stretches which are practically impossible to circumvent, whether on the road or in the court. It is a general rule to stop large cars and ask for the licences of the drivers, while the police have lately shown quite an enthusiastic interest in the position of the identification numbers, &c., as well as minor matters that

constitute omissions merely of a very minor character. The timing details are worked out at headquarters at Lewes, and it is invariably the case that when the motorist is found to have exceeded a speed of twenty-five miles an hour prosecution follows. According to the "Times," the Haywards Heath Bench have established a scale of fines from which there is little hope of escape. For a speed of 25½ miles per hour the fines are £3 and costs extra; then a sovereign a mile is added up to 30 miles per hour, when the fine becomes £10, and proportionally higher as the speed increases. We believe the scale given in the "Times" is rather below the actual state of things, but in any case even at that modest rate the convictions of motorists will secure a goodly revenue for the county exchequer.

Petrol Dangers.

THE Home Secretary has had under his consideration the frequency of accidents arising from the ignition or explosion of petrol and other vapours. At length he has come to the decision that the matter is serious enough to warrant the appointment of a Departmental Committee not only to consider the mishaps, but also to examine the various mechanical devices introduced to diminish the dangers attendant on the storage as well as the use of petrol spirit. The names of the committee will shortly be issued to the public, and doubtless those of our readers who have given technical attention to the matter will take an early opportunity of bringing the results of their thought and study before the notice of the Home Secretary.

The President arriving at the Salon in a two horse-power carriage.
From a Caricature Sketch [in "L'Auto."]

The War Office Trials.

WITH reference to the announcement made in our columns in June last that the Army Council had decided to offer money prizes for the light tractor that would most nearly fulfil military requirements in a trial test, the Secretary of the War Office announces that the amount of the prizes will be £500 from War Office funds and £250 from the funds of the India Office. The number of entries which have been received is eleven, and includes tractors fitted with internal combustion engines and with steam engines, the latter including loco. type flash boilers, water tube boilers, and flash generators. The road trials will commence on Monday, March 1st, 1909. The competing vehicles will assemble by 9 a.m. on Friday the 26th February in the competition enclosure (the situation of which will be announced later). This will be open to competitors from 9 a.m. on Thursday, February 25th, 1909.

Unlighted Vehicles.

THE presence of winter—the coming week will contain the shortest days in the year, judging by our Lighting-up Table—has brought with it the usual complaints as to unlighted vehicles on the roads. It has been generally assumed that the initiative in prosecuting offenders who thus endanger the lives of others upon the highways has been confined to the police; but the chauffeur of Mr. Wegulin, of Kingston, has demonstrated that this is not so; and that a private individual may take action against erring carters and drivers who neglect to consider the

safety of others. He ran into a van which had no light and damage resulted to both vehicles. Upon reporting the matter to the police they declined to prosecute. The chauffeur thereupon decided to take action independently and has obtained a summons from Mr. Cockburn, the presiding magistrate at the Kingston Court. Whatever the result of this case, the fact should encourage motorists in a campaign against those whose thoughtlessness has often led to accidents in the past.

Helping Public Opinion.

NOT often are public meetings called in the Metropolitan area to consider motor traffic, but that which has just been held at Hatcham seems to have attracted a large attendance and given voice to much local feeling. The chairman was the Rev. G. A. Sowler, who moved a resolution urging the L.G.B. to deal with motor traffic in the New Cross district. Apparently few of the speakers—and there were eight or nine—were aware that the initial steps rest with the London County Council. That body, despite the many promptings it has had, has hitherto declined to suggest a motor-car speed limit, and has taken a rational view of its duties, not attempting to harass motorists in the early days of their industry. We understand that a series of similar meetings are being organised in South London, and it is to be hoped that the Southern Motor Club will arrange to have the views of motorists heard at such gatherings.

The Outcry against Motorists.

THE demand for less high-powered cars than was experienced a few months ago seems to suggest to a correspondent that the new accessions to the ranks of motorists have recognised the ill-feeling that exists in some quarters against the very high-powered vehicles that have been in service. At Bristol the outcry does not seem to have influenced the demand, one of our correspondents suggesting that it has been fanned chiefly by people who not only do not own cars, but are not likely to possess automobiles. From Cheltenham we are glad to learn that there has been very little countenance given to the agitation, and that the police authorities in that district, and indeed in the whole of Gloucestershire, are very fair and reasonable in their treatment of and attitude towards motorists. The west of England has been fortunate in the way in which the authorities have regarded the automobile, only a few isolated cases of unreason having been reported.

The Car as a Time-economiser.

THE saving of time that is obtained in many country districts by commercial travellers and others who use the motor vehicle in preference to the ordinary railway has been illustrated by a trip which the guardians of one of the extra-metropolitan parishes have recently been taking in Suffolk and some districts of Essex. It had been reported that many of the workhouses in these country districts were comparatively empty. The Board of Guardians of West Ham therefore decided on a tour of investigation with a view of arranging to send some of the inmates of their overcrowded establishment to those in the country. Many of the houses were found several miles from railway stations, and the motor-car again proved its value in saving time and expense.

Worse than Haywards Heath.

MOTORISTS who complain of the severity of fines for excessive speed in this country may be interested to hear of the measures taken in the premier native State of India to punish infringements of motor regulations recently promulgated there. His Highness the Nizam had a narrow escape from a collision with a car belonging to a Haiderabad notable which overtook and passed at full speed within about two inches of the Nizam's car. His Highness is stated to have inflicted a fine of Rs. 1,000 (£66), and to have ordered the confiscation of all the motor-cars belonging to the offender.

THE PARIS SALON.

[BY OUR SPECIAL REPRESENTATIVE.]

THE eleventh Paris Show presents the French maker in a new light. First, as the determined business man, pushing his wares with an energy unknown at former shows, which were admittedly far too great an attraction for the idle and curious and too little of an inducement to the buyer, and, secondly, as fighting his foreign rivals for lost ground in the trading and racing field. On the foreign stands are to be seen the winning cars of the leading events of the year, and on the eve of the opening of the show the result of the American Grand Prize cast a further gloom on the prospects. It is being preached that the need of the day for the French motor industry is the desire and the will to conquer, and, as some well-known sports-

tension ignition has been abandoned by the large firms, who have up to now been its firm adherents. Nor has this change been made to allow dual ignition to be provided with ease, since dual ignition is rather the exception. Makers incline to the opinion that in the hands of expert drivers, and in racing or demonstration, the low tension system has an advantage, but it is perceived that for the ordinary everyday user of motor-cars, whose numbers are ever on the increase, the help of an expert in tuning up the car is not always at hand, and that the high tension system is undoubtedly the best in these conditions. A proof of this may be seen in the fact that such makers as Brasier, Berliet, Mercedes, and Lorraine-Dietrich have adopted high tension for small cars,

General View of the Salon.

men add, the faith to win the races. Faith in the mechanical features as well as the human side in the race, it is stated, have a deal to do with former French victories.

The Salon presents a high standard of excellence and an advance over previous shows which has not been seen for some years. Great efforts have been made by everyone towards the goal they have in view, whilst the artistic features have been relegated to a less prominent position than in the last two exhibitions, although everyone admits that the decoration of the Grand Palais is quite sufficient for the needs of the show. There is now no great divergence of opinion among the leading makers in respect to the adoption of cone or disc clutches, shaft and chain drive, thermo-syphon and pump water circulation, high and low tension ignition, selective and progressive gear change, pressed steel and armoured wood frames, &c. French constructors, and in fact European builders in general, are pretty well of one opinion on these details, and whilst few makers make remarkable changes in their design all have sought to simplify them to the greatest extent; in fact, simplification is perhaps the keynote of the show. With this end in view low

and fit low tension to the higher powered cars, which will generally be driven by a skilled mechanic.

In further attempt at simplification we see a bare dashboard; the old practice of locating lubricator, pumps, coil, oil, gas, and water gauges, &c., in full view of the driver having been superseded. In the case of Panhard, for instance, who formerly displayed a coil, lubricator, and other accessories on the dashboard, the single-sight feed and a switch is all that is to be seen on this year's models. The bonnet now hides the coil, and the lubricator is on the front side of the dash. Berliet again in his new models has suppressed the sight feed, the dash being cut away to allow the insertion of an oil level. The two sight feeds for the rear axle and gear-box are located beneath the bonnet. Pressure feed being abandoned by this firm, the accessories thereto, the indicators and pump necessary for the gas tank, oil tank, and water circulation, have disappeared. Another interesting example of this tendency is seen in the Renault cars. Here have been no changes in the method of lubrication, ignition, or position of the petrol tank, but the lubricating tank in front of the driver has been replaced

by a sight feed let in flush with the dashboard and covered by a glass plate, which is one of the neatest arrangements to be seen in the show. The filler for the oil tank is behind the radiator filler, the lubricator being lodged in front of the dash. On this stand, it may be mentioned, is to be seen the only survivor of the self-starters which were exhibited at so many stands last year.

The carburettor and admission piping has been the object of attention of many makers. Charron shows one of the best examples of this in the two and four cylinder chassis. The float chamber of the ordinary type has a simple flanged cover held by a flat spring attached to a vertical spindle. Lifting the blade of the spring brings away the top of the box; a tube projects from the float chamber, and from the end of this is placed a vertical nozzle over which is posed a bell mouth ending in a tube leading to the mixing chamber attached to the inlet manifold. The inlet pipe is thus resolved into a six-inch length of copper tube held by a single screw. The exhaust manifold is cast with the cylinders, and the inlet and outlets for the circulating water are each cast in one piece connected to the top and bottom of the dashboard radiator by a short piece of hose, thus practically eliminating piping on the car whether for gas inlet or exhaust. Simplification is again obtained in this model by placing the magneto in front of the engine and locating the cables in a metal tube, giving a motor of great accessibility. The Delaunay-Belleville new model six-cylinder chassis

Fig. 1.—Elevation and Plan of Pipe 40-h.p. Six-Cylinder Chassis.

is also arranged in a similar manner in respect to the water piping, the one-piece outlet being screwed in the head of the cylinder, with a single connection to the top of the radiator.

The placing of the radiator on the dash is meeting with increased favour since makers find that better accessibility is thereby obtained. The new Berliet models present this feature, a tube radiator with a top and bottom tank being connected up in front of the dash. Some smaller firms have closely copied the same idea. On the new Charron cars the dashboard radiator, of the gilled tube variety, with top and bottom tank, is not carried right across the car, but a belt-driven fan connected to the main shaft is placed inside the radiator, which is increased to the full width of the chassis. Leon Bollée and Delahaye show examples of encased valves, a sheet metal plate being used and secured by a single clip. Delahaye further adds to the appearance of the engine by having a single casing to cover the gas intake, exhaust and water inlet.

The London police regulations have had some influence with the French makers desirous of retaining a hold on the English market. The Darracq make has been altered in the sense that the magneto is no longer on the same side as the carburettor, but is placed on a special bracket cast on the crank case. Other firms seeking to produce a suitable taxicab for London have adopted a similar arrangement.

The cardan shaft system of transmission is more common than ever, as is to be expected for the small cars which are the

vogue this year. The chain drive for the larger powered cars stills holds favour, however, and the method is likely to die hard, judging from present indications. There may be a tendency to abolish the torque rod, properly speaking, or to have its functions done by another organ, and this is noticeable even in cars of comparatively large power. The 20-30-h.p. Renault, for instance, is an example of this. On other models of the same make tubular torque stays are fitted in place of the pressed steel

Fig. 2.—The Piccard-Pictet 28-40-h.p. Six-Cylinder Engine.

formerly used. The exception is a small town chassis which has no torque rods at all. The strengthening of the propeller casing is done by some firms to the same end. Delahaye shows a chassis on which the distance rods are attached to the same hanger as the forward end of the rear springs.

As was foreseen, the most interesting part of the show is the small car and voiturette classes, and the usual difficulty of clearly distinguishing between where one class ends and the other begins is enhanced this year. The new two and four-cylinder models of the larger firms, the smallest productions of

Fig. 3.—The Cottin-Desgouttes Six-Cylinder Engine.

Renault, Brasier, Mercedes, Berliet, Lorraine-Dietrich, Charron, Delahaye, &c., could never be termed voiturettes, however, which are generally included in the turnout of Aries, Werner, Delage, Sizaire-Naudin, &c. And yet all the larger firms have produced a small two-cylinder car of about 10-h.p., suitable for light taxicab or city work in general. Even Panhard brings out a two-cylinder model of this type, with the cylinders in one casting, the forward end of the engine being bolted direct to the side frame. Valves are all on one side, the oil tank between the pair of arms on the right of the engine and the carburettor between a corresponding pair of arms on the opposite side of the cylinders, the

high tension magneto being located in front. Thermo-siphon water circulation and an oil pump driven from the end of the cam shaft complete a very neat arrangement under the hood. Engine control is by pedal, no levers being placed on the steering wheel.

One noteworthy feature is the great increase in the number of six-cylinder cars on view, there being no less than ninety-six, as against fifty-seven a year ago, and only twenty-three at the 1906 Salon. Prominent among the new models is the 30-h.p. Panhard. The cylinders are separately cast, but are placed close to each other to reduce the overall length as much as possible. The vehicle, which is chain driven, is fitted with a two-seated body, and with its greatly inclined steering column has a very speedy appearance. The Pipe Company are also exhibiting a fine sample of their 40-h.p. six-cylinder car, Fig. 1, and state their firm adherence to this type of vehicle. The engine, the cylinders (105 mm. bore by 125 mm. stroke) of which are cast in pairs, has a ball-bearing crank shaft and steel pistons. The valves are located in the sides of the cylinder heads in the usual Pipe fashion. Another good example of six-cylinder car is that shown by the Piccard-Pictet firm of Geneva. A very high efficiency is claimed for this car. Facility in dismantling the engine parts is obtained by means of the plate uniting the engine with the side frames, this being cast with the motor itself. Double ignition by means of high tension magneto and accumulators is retained. A clutch of the multiple disc type is employed. A detail of the car is that none of the mechanism is visible from the outside of the chassis, everything being concealed. The bore and stroke of the engine, which is rated at 28-40-h.p. (Fig. 2), are 105 mm. by 125 mm.

A car which is not as yet known in England, but which is rapidly forging to the front in France, is the Cottin-Desgouttes, made at Lyons by the firm of that name. The 1909 models include 12-h.p., 18-h.p., 30-h.p. and 50-h.p.

Fig. 4.—The Henriot Chassis with Combined Clutch and Change-Speed Gear.

four-cylinder, and 16-h.p. and 45-h.p. six-cylinder. Fig. 3 gives a view of the engine of the last-mentioned car, from which it will be seen that it is entirely self-contained, the water circulating pump and magneto being mounted on small platforms built as extensions of the crank chamber. A carburettor of the Zenith automatic type is employed with an addition to allow pure air to be drawn into the cylinder when the throttle is entirely closed. A special feature of the car is the clutch, of which a description was given in the *M.C.J.* of June 20th last. Briefly put, the improvement consists in building the female portion of the clutch not as an integral part of the flywheel, but in such a way that

while it is bound to rotate therewith it has a certain amount of room in which it can adjust itself for any temporary lack of alignment. The final transmission is by side chains, which are enclosed in readily detachable gear cases.

Other six-cylinder cars on view include the Brasier, La Buire, Leon Bollée, Renault, Mors, a 25-h.p. Unic with the cylinders cast in sets of three, a 25-h.p. Clement-Bayard, a 24-h.p. Lorraine-Dietrich, a 60-h.p. Itala, a 20-h.p. and 60-h.p. Peugeot, a 30-h.p. Rochet-Schneider, and a 20-30-h.p. Siddeley. The Wolseley; Tool and Motor-Car Company, Ltd., are the only

Fig. 5.—The Gnome Seven-Cylinder Aeronautical Engine. The motor, which is of the rotating type, develops 50-h.p. and weighs only 165 lbs.

British car firm exhibiting, and in addition to the 20-30-h.p. show a 40-h.p. four-cylinder chassis. Full particulars of both of these were given in the *M.C.J.* last week.

Distinct departures from the common trend of design are rare. The Henriot engine shows a novelty in the two chassis fitted with four-cylinder motors, air-cooled by a couple of fans on the valve side of the engine driven by bevel gear and spindle from the cam shaft in one case, and belt driven from a pulley on the same shaft in the other case. A planetary transmission contained within the flywheel is seen on the same car (Fig. 4). The three forward speeds are controlled by separate pedals; the second-speed pedal also puts the reverse in action in conjunction with a hand side lever. A four-cylinder water-cooled engine without radiator is on view on the same stand. The water is contained in a tank on the front of the dashboard and thermo-siphon circulation is adopted, with the addition of an air pump driven from the rear end of the crank shaft and connected to the point where cool water enters the cylinders; by discharging its jet of cold air the water is cooled and driven into the jackets at the same time.

The Knight sliding-valve engine does not attract the amount of attention that was expected. The Panhard people, who own the French manufacturing licence, are not showing a chassis fitted with it, but it is shown on one of the Belgian Minerva chassis. The first application of the Knight engine in France has been made to the G.E.M. petrol-electric chassis, made by the Société Française des Automobiles Electro-Mécaniques. The engine is that made at the Daimler Coventry works, and it is stated that the 38-h.p. motor will be adapted to all the G.E.M. chassis used for heavier work. It is shown fitted to an omnibus chassis destined for the Paris Omnibus Company. The engine has been adopted on the electrically-driven chassis without alteration; the ignition is by Simms Bosch high-tension magneto, although the special application of the motor in conjunction with

the electric drive would render this unnecessary. The carburettor is special, being magnetically throttled when the storage battery is being charged, since this is done when the car is running down hill and the motor acts as a generator, the petrol engine being then, of course, unnecessary. The carburettor is automatically opened whenever the battery commences to discharge into the dynamo. The battery of twenty-four elements is capable of giving an output for forty-five minutes of twenty-five amperes at fifty volts and is useful in case of quick starting or on steep grades. In service the accumulators are practically kept constantly charged.

A magnetic clutch is used, and magnetic brakes are fitted in addition to the usual pedal-operated brakes on drums on the rear wheels. All the electrical connections are enclosed within a double dashboard. The car is reversed by means of a sliding gear mounted on the end of the propeller shaft, and contained in a casing alongside the differential. The usual features of the petrol-electric drive are of course evident, and the G.E.M. arrangement, admittedly a good one of its class, has undergone very few changes since it was first presented to the public at the 1907 Show.

The only other petrol-electric vehicle in the exhibition is the Vate. This is a 10-h.p. chassis, in which a combination of dynamo and motor is built up as the flywheel of the engine; a small battery of accumulators is also carried, this being kept fully charged by the dynamo; on ordinary roads the engine drives the rear axle direct. When a hill is encountered the dynamo acts as a motor, taking current from the battery and adding its power to that of the petrol engine.

Petrol-electrical vehicles are not only few in number, but there are only one or two electromobiles to be seen, while as for steam it has not a single representative in the Show.

An eight-cylinder V-shaped motor is employed on the chassis of the E.N.V. Motor Syndicate. The cylinders, which are cast in pairs, are provided with copper water jackets. The change-speed gear is also interesting. The first speed forward and the reverse are in a gear-box by the engine, but two other forward speeds are obtained direct by separate pairs of bevel wheels in the differential casing.

Although it is the expressed intention of the promoters of the Salon to provide a show for aeronautical motors in the second

to and the pump is driven off the crankshaft. Each of the magnetos supplies current to four cylinders, so that in case of accident to one set the motor would still operate. The Gnome people also show a light-weight engine in which steel is largely used and a hollow crankshaft allows carburation through its centre. The engine (Fig. 4) comprises seven air-cooled cylinders, which revolve round the crank-shaft, there being no fly-wheel. The motor, which is stated to develop 50-h.p., weighs only 165 lbs. The same firm is also building a 100-h.p. engine on similar lines, this having no fewer than fourteen cylinders and weighing only 220 lbs. The Pipe Company, of Brussels, in addition to their cars, have on view an aeronautical engine comprising eight cylinders arranged in the form of a V. The motor, which is stated to

Fig. 7.—The G.A. Arecal Radiator.

The illustration shows the method adopted in building up the elements of the new radiator.

have developed 78-h.p. during a two hours' test, weighs only 290 lbs. The cylinders are 3.9 in. bore and stroke, and the same valve performs the function of inlet and exhaust by means of a sliding sleeve.

Among the novel accessories on view one of the most interesting and which is attracting considerable attention is that shown fitted to a car on the Rapid stand. It is known as the Douche Pneu (Fig. 6); it consists of a small cylinder to contain water, with flexible tubes heading to each of the road wheels, terminating with flat nozzles to spray water on the treads of the tyres. The water is sprayed under pressure, either by a hand-pump or from the exhaust. The water can be turned on or off at will, and a douche to the tyres given every eighteen miles or oftener, as the conditions of the road and weather require. The cylinder has a water capacity for about 150 miles. It is claimed that the douche adds considerably to the life of the tyres and lessen the chances of punctures.

A prominent stand in the accessory section is that of Messrs. Grouville and Arquembourg, Paris, who are well known as manufacturers of radiators and carburettors. Fig. 7 shows the method of construction adopted in the firm's latest radiator, which is known as the Arecal, and which is being used by several of the leading French motor-car builders. As will be seen, it consists of a series of thin flat copper tubes, between which the thin radiating surfaces are fixed by a patented process. It is claimed for the new radiator that it combines an equal efficiency of the best honeycomb type with the solidity of the strongest-gilled-tube pattern. In the case of natural thermo-syphon circulation the water tubes are arranged vertically, as illustrated; where a pump is employed they are placed horizontally. A new departure in connection with the well-known G.A. carburettor is a special fitting arranged to be clipped round the exhaust pipe to provide the necessary heat to enable benzol to be used as fuel in place of petrol. The G.A. Gypta is another interesting addition to petrol motors, enabling as it does part of the exhaust gases to be compressed into a reservoir ready to be used for the inflation of tyres, for the operation of self-starters, motor horns, &c., by the simple opening of a cock.

In the side galleries there are many interesting novelties to be seen, extended reference to which will be made later.

(To be continued.)

Fig. 6.—The Douche Pneu, a device for cooling off the tyres when the car is running.

The illustration on the left shows the Douche in operation, while that on the right depicts the hand pump, gauge and filling tube mounted on the dashboard.

exhibition to be opened on the 24th inst., yet several firms have produced their novelties in this line. Gobron displays one of the most interesting motors in this class, the eight cylinders developing 80-h.p. at 1,500 r.p.m., and weighing, complete with two magnetos, 460 lbs. The cylinders, of the usual Gobron construction, form pairs, and each pair is arranged at 90 degrees from its neighbour, the group being thus in the shape of an X. A two-throw crankshaft is employed. Water cooling is resorted

EMERGENCY MOTOR REPAIRS AT HOME AND ON THE ROAD.

By E. T. HUMPHRIES.

EMERGENCY repairs to motor-cars need not necessarily be associated with the road; many owners live in isolated spots far removed from the hub of any industrial centre where skilled labour can be obtained. A slight defect when one has to go on a sudden or urgent journey may cause much inconvenience, resulting also in loss of time and money. Doubtless with motoring as well as most other things a little knowledge is dangerous, but at the same time "Faint heart never won fair lady."

A famous writer said, "The most just man could never defend the innocent or detect the guilty unless he knew how to be just." The same with a man and his car: unless he knows how to make wrong right he is not able to get the best out of his machine. If only a small thing goes amiss, a self-performed repair not only saves a bill, but enables the running costs to be kept down to a lower level than would otherwise be the case. For this reason comparisons of the expenditure under the heading of upkeep must greatly vary according to individual conditions.

How often one hears the owner of a car say "It is not pulling well to-day; I believe the compression is weak." On investigation this proves to be the case, and a closer research discloses the fact that the piston rings fit somewhat slack, which accounts for the trouble. The result of such a conclusion is generally a visit to the local repairers, who will in odd cases suggest expanding the rings, but more often their replacement by a new set. Now the question of the moment is, could not this simple operation be done in the owner's garage by himself or his chauffeur, if either have only a rudimentary knowledge of the use of a hammer? There is an operation known in the engineering world as "penning"—that is, flattening the inside periphery of a ring; all that is necessary is a smooth plate and a hammer and a series of gentle, but firm, blows or taps, which will elongate the ring. The effect of the hammering can be regulated to a fraction and tested by inserting the rings in position from time to time as each is so treated. The writer has done this more than once, and made previously loose-fitting rings hold a good compression.

It is well to point out that some rings are cut eccentrically, i.e., thicker in one part than another, the greatest thickness being usually exactly opposite to the slot, thus giving increased outward spring to the ring. When treating rings of this pattern the best results are obtained, and in less time, by striking the thickest part one-third less blows than those on either side. Suppose the ring to be the face of a clock with the slots at the top representing 12 o'clock. Those parts representing 3 and 9 o'clock should be hammered most, and the part at the base, viz., 6 o'clock, the least.

A matter which, although very simple, one often sees mentioned in the correspondence columns of motoring and engineering papers as causing trouble to amateurs is the removal of studs, fly wheels, or gears from their shafts. In view of the fact that the weights of motors, and particularly motor-cycles, have been reduced in many parts to the lowest possible limit of safety, it is almost needless to say that to try to unduly force a nut, or put excessive stress on a stud, will generally result in breakage. Nearly everybody knows that most metals expand under the effect of heat. This is also seen with other substances; take such a simple thing as the sticking of a glass stopper in a bottle. Nothing is easier to remove; place round the neck of the bottle a warm wet rag, and if the stopper is still refractory dip the top of the same into cold water. The effect is that the stopper contracts and the bottle expands, and the desired result is attained. Now the same thing takes place, only in the reverse order of things, with a refractory nut. Get a piece of iron (if a small nut a piece of hoop iron will do); make it hot and bend it round the nut, holding it in place until the nut is quite warm. The heated piece should, however, be removed before the

stud has become too hot. Apply a spanner at once and the nut will come off quite easily. A wet rag placed below the nut and round the stud is an assistance if the position is such that it can be used. A rather interesting and most useful repair was fixed up on the road to Moscow. It is always admitted that if anything goes wrong with the steering gear of a car one is absolutely helpless, the man at the wheel having a feeling akin to that of a horse driver when a horse bolts or a rein breaks. When on a journey some one hundred miles short of Moscow the ball end of a steering arm broke. There we were, many versts of unbroken steppe between us and our destination, and not even a police trap to appeal to. What was to be done? On looking through the spare parts and the contents of the tool box an idea struck the writer which, to quote Captain Cuttle, it may be well for the reader "to make a note of." A fair-sized nut was found, and after some filing was forced into the end of the broken arm until sufficient protruded through to "nobble," or, in other words, hammer over the nut face, so that it could not come off. The file was then applied to the outside faces of the new ball end until the sharp edges had been removed, and, though at times the steering was somewhat stiff, we proceeded for over 100 miles without any trouble. The whole operation was done inside 50 min.

One of the six Hotchkiss 30-40-h.p. Cars equipped with quick-firing gun recently supplied to an European Government.

A differential gear having been removed by the usual hammering and drifting process, resulted in a broken wheel boss. When replacing it the crack opened, leaving the wheel loose on the shaft. Having got the reader so far, it will not be out of place to state the easy repair effected to overcome the difficulty; at the same time, if the hot and cold process previously described had been resorted to in the first instance, no fracture would have occurred. An ordinary piece of mild steel (iron would have done), slightly narrower than the wheel boss, having been obtained, it was forged into a ring and hammered smooth inside, its size when cold being slightly smaller in diameter than the boss; the ring was then reheated and forced as a tight fit over the wheel centre. Contraction in cooling followed, and it was then practically one solid mass. The foregoing may appear a little difficult, but such is not the case; any country smith would make the ring; a hammer and a little common sense does the rest.

THE proceedings of the Rugby Engineering Society for the session 1907-8 have just been published and testify to the value of the Association, both from the technical and the social point of view. Among the papers included in the volume is one by Mr. B. Hopps on the London motor-omnibus problem; with special reference to the petrol-electric system.

B

THE A.C.A. GRAND PRIZE RACE.

CONSIDERABLE interest was evinced in the first race organised by the Automobile Club of America for its Grand Prize. The event, which was conducted under the same rules as the 1908 A.C.F. Grand Prix contest, the cylinder dimensions being restricted to a bore of 155 mm. in the case of four-cylinder engines, was held on the public roads of Chatham County, Georgia, adjacent to the city of Savannah. The course, which varied in width from thirty to sixty feet, measured 25.13 miles, and had to be covered sixteen times, giving a total distance of about 402 miles; it had been thoroughly prepared and oiled, and was patrolled by a large force of State troops under military orders from the Governor of the State. The surface on the whole was flat, but there were numerous sharp turns, and though some of them had been altered and banked there were points of the course which were still considered dangerous. The start took place at 9.45 a.m., when the following twenty competitors, six Italian, six American, five French and three German, were sent off at minute intervals.

| No. | Driver. | Car. | No. | Driver. | Car. |
|-----|---------|-------------------|-----|----------|----------------|
| 1 | Rigal | Bayard-Clement | 11 | Harding | National |
| 2 | Mulford | Lozier | 12 | Cagno | Itala |
| 3 | Seymour | Simplex | 13 | Hautvast | Bayard-Clement |
| 4 | Burman | Buick | 14 | Wagner | Fiat |
| 5 | Haupt | Chadwick | 15 | Hanriot | Benz |
| 6 | Nazzaro | Fiat | 16 | Strang | Renault |
| 7 | Zengle | Acme | 17 | Fournier | Itala |
| 8 | Hemery | Benz | 18 | De Palma | Fiat |
| 9 | Daray | Lorraine-Dietrich | 19 | Erle | Benz |
| 10 | Szisz | Renault | 20 | Piacenza | Itala |

View on the Course on which the A.C.A. Grand Prize Race was run.

The Fiat cars quickly took the lead and held it until the third round, when Hanriot (Benz) ran into first place. This he held until the end of the seventh circuit, at which time Hemery (Benz) was second and Nazzaro (Fiat) third. Eight of the competitors had, up to this point, fallen out of the race, these including all the American cars and Szisz (Renault) and Piacenza (Itala). In the eighth lap Hanriot fell back to the fifth place, Wagner (Fiat) taking up the lead, hotly pursued by Hemery (Benz), who indeed passed him in the ninth circuit. At the end of eleven laps Wagner, however, again came to the front, while twelve circuits saw Nazzaro first, Wagner being second, and Hemery only a few seconds behind. The struggle between these three was unusually keen. Nazzaro lost a few minutes in the penultimate round, owing to tyre troubles, but Wagner kept just in front of Hemery and won by the narrow margin of sixteen seconds.

Out of the twenty cars which started only the following ten finished the race :—

| No. | Driver. | Car. | Time. |
|-----|----------|-------------------|----------|
| | | | H. M. S. |
| 1 | Wagner | Fiat | 6 10 31 |
| 2 | Hemery | Benz | 6 10 47 |
| 3 | Nazzaro | Fiat | 6 18 47 |
| 4 | Hanriot | Benz | 6 28 16 |
| 5 | Hautvast | Clement-Bayard | 6 34 5 |
| 6 | Strang | Renault | 6 43 37 |
| 7 | Rigal | Clement-Bayard | 6 45 47 |
| 8 | Fournier | Itala | 6 46 32 |
| 9 | De Palma | Fiat | 6 51 31 |
| 10 | Daray | Lorraine-Dietrich | 7 19 40 |

Wagner's average speed works out at about 65½ miles per hour. The fastest lap of the day (21 min. 36 sec.), was made by the Fiat driven by De Palma in the second circuit. A somewhat serious accident occurred in the tenth lap. Erle (Benz), was travelling at a high rate of speed when the tread came off one of his tyres and struck him in the face. He lost control of the car, and ran into a tree. The machine was overturned, but both driver and mechanic escaped, in a miraculous manner, without serious injury.

In addition to the Gold Cup which forms the Grand Prize and is a perpetual trophy to be competed for annually, money prizes to the extent of £1,600 were awarded, the winner taking £800, the second £400, the third £200, the fourth £150, and the fifth £50.

On the previous day a contest for light cars was held over part of the same circuit, the vehicles in this case being limited to a bore for four-cylinder engines of 3½ in. and to a minimum weight of 950 lbs. The circuit measured nearly 10 miles, this being covered twenty times, giving a total distance approximately of 196 miles. Out of the seventeen entries fifteen—twelve American, two Italian and one French—duly started, of which, however, only six completed the whole distance. The event proved a victory for the Lancia car, driven by Hilliard, who covered the distance in 3 h. 43 min., equal to an average speed of about 53 miles per hour. Burman on a Buick was second in 3 h. 49 min. and Lorimer on a Chalmers third in 3 h. 53 min.

SEVERAL cases of sheep being run down by motorists having occurred in and about Worcester of late the Bench of the Cathedral City have expressed a determination to stop such offences by the infliction of heavy fines on those who are proved to have been the cause of such mishaps.

THE Albion 16-h.p. car, reference to which was made in our last issue, is provided with a two-cylinder engine, the bore and stroke being respectively 4½ in. by 5 in. The latest improvements and additions to this type comprise chiefly an extra air attachment and chain cases. Until quite recently the vehicle was entirely governed by a single lever on the steering column, but experience has proved that more or less air is occasionally required, according to outside atmospheric temperatures. An extra air valve has consequently been fitted, the same being controlled from the dashboard.

WITH all their Diaries, Tablet Calendars and Engagement Blocks the firm of Thomas De La Rue and Co., Ltd., are issuing Insurance Coupons, which should do much to add to the popularity of the dainty and serviceable publications issued from 110, Bunhill Row, London, E.C. Among the specialities in the diaries for 1909 are the Onoto Diary—a thin and flexible volume with a pencil in the back loop and ample space for daily notes; Index Diaries in which reference can be made to any month instantaneously; the Handy series of diaries of diminutive size, in which the printing is so ingeniously arranged that there is writing space for every day; Diary Engagement Blocks opening both from the top and from the side, and Tablet Calendars. The originality of design and splendid printing in all these works make them among the most favoured Diaries for general service.

GOSSIP FROM PARIS.

Rumoured Withdrawals from the Grand Prix Race.

Immediately after the inauguration of the Salon de l'Automobile by the President last Saturday great sensation was created by the handing about of a list of seven French, two German and two Italian automobile manufacturers who it was affirmed had agreed not to participate in the Grand Prix of 1909. The names inscribed were Panhard, Renault, Peugeot, Lorraine-Dietrich, Bayard-Clement, Brasier and Darracq, (French); Mercedes and Benz (German); Itala and Fiat (Italian). This list goes beyond the announcement I was able to make in the *M.C.J.* last week, and I think it should be taken with a grain of salt. At the beginning of the present year it was affirmed the big automobile firms would abstain from exhibiting at the Salon and now we see them all there. It may be the same with the Grand Prix. The decisions of a private firm or of a board of directors of a company can always be modified or even reversed. However, I am assured on good authority that five of the leading automobile makers have signed an agreement not to compete in next year's Great International Competition. It is not difficult to guess which those five firms

aviation, and a few days ago an almost equally large number of senators followed their example, placing M. de Freycenet at their head as honorary president, and M. d'Estournelles de Constant as acting president. The Government has consented to inscribe £4,000 in the budget to be offered in prizes to the aviators, who had already more than £50,000 to compete for. The Aero Club instituted a prize of £4,000, and at once the Automobile Club decided to occupy itself with aerial locomotion, and created a prize of £8,000. The National Aviation League had in the meantime received rich donations amounting to very many other thousand pounds to further the interests of the new scientific industry. That is all very well, but the aviators themselves are somewhat alarmed at the great expectations raised by their exploits. They have given man wings, but the feathers are still weak and must be allowed time to grow and get strong. The aviators have advanced with giant strides during the last twelve months and the French seem to imagine they will always continue to do so. But Rome was not built in a day, and though the time is fast approaching when perhaps a journey from Paris to London on an aeroplane will not be a very uncommon occurrence, it must not be expected that the feat will be accomplished to-morrow.

A Group of Military Chauffeurs at the Royal Ordnance College, Woolwich. The men have been trained by Sergeant Chaplin, and out of 31 candidates 29 have successfully passed the R.A.C. examination. In the group Sergeant Chaplin is seen seated in the front row at the left of Captain H. Noble (in the centre), while at the two extremes are Messrs. H. D. Smith and L. A. Fox, of the R.A.C.

are, since they are all represented on the A.C.F. Sporting Committee. It is rather anomalous to see men who choose the ground and draw up the regulations for a race compete in it, but it is still stranger to see them suddenly decide to hold aloof from the event after they have made all the preparations for it and invited all the world to meet them on the Anjou circuit. I fear their decision is not due to any qualms of conscience concerning the rather false position they have occupied for so many years. No, it appears, as I said last week, they think the game is not worth the candle. But is that all? Are they not afraid, especially with the reduction of the cylinder bore to 130 mm., that they would, if they entered the lists, be beaten, not only by foreign cars, but perhaps figure on the final result list after some of the French "small fry"? I should not like to pronounce, but it must be admitted their abstention, if persisted in, will render such a supposition permissible.

Prizes for Aviators.

The French are allowing themselves to be carried away by their enthusiasm for the conquest of the air. Some seventy-five deputies recently formed themselves into a group to encourage

Pails to London by Airship.

M. Clement, the well-known automobile manufacturer, and M. Henry Kapferer, an equally well-known aeronaut, intend to commence the invasion of England by the air. In their steerable balloon the Bayard-Clement they will cross the Channel high above and out of the reach of the Dreadnoughts! One fine morning, perhaps before the new year, the airship will start out from its shed at Sartrouville, steer straight to Boulogne, and then, boldly flying across the Silver Streak, make straight for London. That is what has been decided! The distance as the crow flies is about 250 miles. The enterprising invaders make light of all the difficulties, and seem to despise even the idea of breaking the aerial voyage by a stop at Boulogne, which they think will be unnecessary. There will be at least seven persons in the car, and it is hoped that Commandant Renard, who is only waiting for the establishment of a means of aerial communication to visit the dominions of his Majesty King Edward, will be among them. It is perhaps probable the blustery winter weather will prevent the voyage being taken quite as soon as M. Clement hopes, but it may be relied on the airship will, ere long, be seen circling above St. Paul's Cathedral.

MARNEY.

CONTINENTAL NOTES.

Touring in France.

Motorists who contemplate a continental tour will appreciate a concession just made by the French Government as the outcome of representations resulting from the proceedings of the Ligue Internationale des Touristes. Motorists in possession of triptyques will be permitted to make their first entry or last exit on Sundays and fête days, the regulations hitherto having permitted the Customs Houses to be open only on ordinary weekdays. The new arrangement will apply only on roads over which the greatest amount of motor traffic passes, but, notwithstanding that restriction, it should prove a great convenience.

The 1909 Prince Henry of Prussia Touring Competition.

The Imperial Motor Club and the Association of German Automobile Manufacturers have decided to lower the minimum volume limit for cars eligible for the 1909 Prince Henry of Prussia Touring Competition, making it 1.6 litres in place of 2 litres, as originally intended. The minimum weight has been fixed at 750 kilos, of which at least 15 per cent. must fall to the bodywork. For cars with engines of greater volume the

Touring in Italy.—An Incident on the Summit of the Calabria Pass.

weight allowed increases 1 kilo per 0.01 litre. There will be no hill-climbing competition, but instead of this a couple of speed trials on the level will be held. A somewhat novel system of handicapping is also to be introduced. Those drivers who, since January 1, 1905, have not won any money or honour prizes for themselves or the owners of the cars either at home or abroad in an officially-recognised race will receive three good marks; these will not, however, annul bad marks except those given for change of and repairs to tyres.

To Prevent Mud Splashing by Motor-Buses.

The Compagnie Générale des Omnibus, of Paris, has made many attempts to overcome the nuisance caused by the splashing of mud on pedestrians by their motor-buses. Apparently none of them have proved effective, for they have organised a competition of devices intended to prevent mud splashing. Entries will be received at the offices of the company, 34, Rue Championnet, Paris, until the 15th inst., and competitors are to state the price at which they supply their arrangements, and also mention the royalty demanded in case the company decide to manufacture the devices themselves.

Industrial Motor Vehicle Trials in Sweden.

The regulations in connection with the reliability trials of industrial vehicles which the Swedish Imperial Automobile Club will hold in May next year have now been issued. Classes will be

provided for (1) delivery vans up to 12 cwt. capacity; (2) motor-lorries to carry from 14 to 24 cwt.; (3) motor-lorries to carry from 3 to 5 tons; (4) motor-lorries to carry from 6 to 8 tons; (5) motor-lorries to carry over 8 tons; (6a) motor-buses with seating accommodation for twelve persons; (6b) motor-buses with seating accommodation for more than twelve passengers. The trial will consist of at least six daily runs, the distance ranging from thirty-seven and a-half to ninety-four miles, in accordance with the class. Entries will be received up to March 1st next, and full particulars can be obtained from the club, whose address is Hotel Continental, Stockholm.

The Motor Movement in Portugal.

According to a recent return, there are at present only 838 motor-cars in Portugal, of which 501 are in Lisbon and 148 in Oporto. With the view of giving a further impetus to the movement the Royal Portuguese Automobile Club is endeavouring to secure a reduction in the import duties of petrol, tyres and other accessories; and a simplification in the Customs formalities, the latter in order to induce touring motorists to visit Portugal more frequently and in greater numbers than is now the case.

Motor-cars in the Spanish Army.

The Spanish military authorities have recently organized automobile drivers' schools in connection with several regiments, with the object of training a staff of skilled drivers. The schools are said to be well equipped in the way of machine tools for making all kinds of repairs, and are conducted under the supervision of engineers of the Central Electrical School. A corps of motor volunteers has also recently been organized under the auspices of the Spanish Royal Automobile Club.

Aeronautical News.

On Saturday last the German military airship Parseval fulfilled the last outstanding condition for its purchase by the authorities by making a flight to determine the actual speed it is capable of developing.—A Ligue Aérienne Nationale Suisse has just been formed in Geneva.—It is reported that the Russian Government has ordered six aeroplanes from Mr. Wilbur Wright.—Considerable interest is being shown in the Concours des Aeroplanes, which is to commence at Monaco on January 24th and continue for two months. It has been decided that the aeroplanes shall be placed on the quay of Monaco Harbour, from which they will have to start on their course to Cap Martin and back, a distance of about six miles.

Miscellaneous Items.

The Automobile Club de Picardie of Amiens proposes to hold an exhibition of agricultural motors during the course of the coming year.—The French Post and Telegraph authorities are about to invite tenders for the transport of the mails between Riom and St. Pardoux by motor vehicles.—An automobile exhibition is to be held in Turin, from January 30th to February 14th next.—A speed limit of 12 kilometres per hour having been imposed by the municipal authorities of Beauvais (Oise) France, all motorists entering the town are being pulled up at the octroi gate and handed a notification of the regulations in three languages—French, German and English.

Les Vieilles Autos.

A quoi servent les vieilles automobiles, les antiqués châssis démodés, les valeureux moteurs qui menèrent le bon combat aux premiers âges de l'automobilisme? Les uns se rouillent sans doute au fond des remises, dans un coin perdu des garages, mais il en est d'autres qui continuent leur vie de bons et braves moteurs, à peine un peu asthmatiques, et encore. Ainsi, il y a quelques jours nous avons remarqué à Paris, dans le quartier de l'Etoile, un châssis Panhard et Levassor, 8-h.p., modèle Paris-Amsterdam, qui actionnait, au moyen d'un embrayage spécial, un appareil de nettoyage des appartements par le vide. Voilà une application ingénieuse des vieux châssis. La voiture et son attirail se rendent devant la maison à nettoyer. Là il suffit de désembrayer la commande des roues, pour embrayer sur l'appareil quelconque de "suction," et le tour est joué. C'est simple et pratique!

THE SOCIAL WHIRL.

KING EDWARD and the Royal family were busy motoring on the occasion of the birthday of Queen Maud of Norway, on the 26th ult. Her Majesty celebrated the occasion at Appleton House, Sandringham. The King, who was on a visit to Lord and Lady Farquhar at Castle Rising, motored in the morning to Appleton House to wish Queen Maud "many happy returns," and to meet his son-in-law, King Haakon. Queen Alexandra, the Princess Royal (Duchess of Fife), and Princess Victoria motored from Sandringham House to offer their congratulations, and there were many motoring parties in the afternoon.

It has now been definitely decided that the proposed county testimonial to the Marquis of Hartford shall take the form of a motor-car, and, although the proposal has not yet appeared in print, it is probable that many of his London friends will similarly recognise the work done by the Bishop of Stepney. He will want an automobile to cover the whole of his northern diocese.

THOSE who were in the centre of automobilism in the early days may remember that soon after the R.A.C. removed from its cosy quarters in Whitehall Court to the present location in Piccadilly, a discussion took place with regard to the Motor Volunteers. A whole evening was devoted to the subject. Pitiful tales were told of loyal owners of motor-cars waiting foodless outside comfortable houses while the officers they had driven were dining within. Various indignities were undoubtedly imposed upon the pioneers of the movement—more from want of thought and lack of knowledge on the part of the authorities than from *malice prepense*. With the proper organisation into the Army Motor Reserve, it was to be expected that such stories would pass into legendary lore and not be repeated. Such, however, is reported not to have come to pass, and at recent manoeuvres some strange happenings have occurred. They have at length reached the ear of Mr. Haldane, and it is currently whispered in the Service clubs that the War Office has now undertaken to define anew the duties of this valuable branch of our military reserve.

MEN who hold themselves and their cars in readiness for national emergencies are certainly deserving of consideration, and all will hope that those who are attached to the Motor Reserve will have proof that their services are not only appreciated on paper but are rightly employed when engaged in operation—whether in these "piping times of peace" or in times of sterner conflict.

MR. F. S. CODY, the War Office aeronautical expert, is a keen motorist, and was one of a number of military men who travelled from Aldershot one day in March last to inspect the exhibits at the Agricultural Hall Motor Show. The last time I saw him was at Olympia, where he was closely studying the carriage work in the Annexe. All motorists will regret to learn he has just had a nasty accident. On Saturday evening he was driving a car near Aldershot, when, in turning a corner, he met a cart which is said to have been approaching on the wrong side. Mr. Cody endeavoured to avoid a collision by passing on the other side, but was unable to prevent an impact, the shafts of the cart crashing into the side of the car. Mrs. Cody, who was seated behind her husband, was seriously injured.

In the tyre section of the Show much interest was taken in the K.T. variety illustrated in a recent *M.C.J.* These are being favourably regarded in connection with pleasure cars. Sir Nevill Gunter, Bart., one of the vice-presidents of the Society of Motor Mechanic Drivers, has adopted them, as have also H.S.H. Prince Louis of Battenburg, Sir Oswald Mosley, Bart., Sir Vincent Caillard, and Major Frazer-Tytler, of Aldourie Castle, Inverness.

LOLLIUS.

HERE AND THERE.

THE Bishop of Bath and Wells has just become the owner of a Singer car.

THE Ceylon Budget estimates for 1909 include provision of £4,252 for motor-cars for Government service.

WE regret to learn of the death of Mr. E. A. Stretton, the managing director of Strettons, Ltd., motor engineers, Cheltenham.

A PUBLIC meeting is announced to be held in the Athenæum, Manchester, on the 11th inst., to form a branch of the Highways Protection League.

AT Newport-on-Tay (Fifeshire), Mr. J. T. Young has a large garage and repair works, the latter being well manned by competent mechanics and equipped with the latest types of machinery.

A NEW arrangement for starting the engines of petrol cars from the driver's seat has been devised by Mr. Mallins, the traffic manager of the Liverpool Tramways. We hope to give some details of the new device in a later issue.

WE illustrate herewith four of the Dennis 3-ton mail vans recently completed for Messrs. McNamara, the Royal Mail contractors, for the new motor mail service between London and Southampton and between London and Portsmouth, which commenced in the 1st inst. The vehicles, which are fitted with Dennis 35-55-h.p. engines, have been tested with full loads,

have completed the journeys in much less time than is required by the Post Office authorities, and have negotiated the steepest hills on the journey with the greatest ease. Leyland Motors, Ltd., have also built a number of 3-ton vans for the new service. In this case the motive power is supplied by a 35-40-h.p. engine, the transmission being on the Leyland Company's standard lines. A feature of the bodywork of the vehicles is that provision is made for the sorting of letters *en route*, in addition to the conveyance of parcels, the latter being carried on the roof.

ON Saturday pedestrians in the Strand and other London thoroughfares saw the new covered-top electrobus which the London Electrobus Co. hopes to make a permanent feature of traffic in the Metropolis. The accumulators, which weigh about 30 cwt., are placed below the level of the axles, and the seats on the upper deck are arranged transversely with gangways on either side instead of along the centre. There are now an average of seventeen electrobuses running daily in London.

A LATE addition to the motor-car exhibits at the Stanley Show last week was the Colibri 8-h.p. two-seated car made by the Norddeutsche Automobilwerke of Hameln, Germany. The car comprises a number of interesting points, not the least of which is its extremely moderate price. The engine is of the two-cylinder type, with magneto ignition and thermo-siphon water circulation. The drive is transmitted through a three-speed gear-box giving a direct drive on top to the live axle. Full particulars of the car can be obtained from Mr. A. Powell, of the Earl's Court Motor Garage Company, Ltd., Earl's Court, S.W.

THE Merchant Venturers' Technical College of Bristol is about to engage a professor of motor-car engineering.

A GERMAN motor-car manufacturer has just introduced a new vehicle fitted with a four-cylinder engine of 4-8-h.p. The dimensions of the cylinders are not stated.

THE motor yacht "Mercedes," built to the order of M. E. Jellinck Mercedes by Messrs. Simpson, Strickland and Co., has left Dartmouth for Nice. The vessel has a length of 136 ft. and beam of 15 ft., while the contract speed is $21\frac{1}{2}$ knots.

FROM the National Motor Academy and Exchange, Ltd., of Boundary Road, Notting Hill, London, W., comes a copy of some motor questions they are using at their school. These test questions suggest the thoroughly practical nature of the instruction that is being given at the Academy.

Now that vulcanizing has become the accepted method of dealing with punctures and cuts in tyres, motorists will follow with interest the introduction of any new appliances calculated to secure results in which economy and efficiency are combined. Lately Messrs. Richard Gornall and Sons, of Pilling, Garston, Lancashire, have brought out an Electric Vulcaniser, the form of which will be seen on reference to the accompanying illustration, in which the vulcanizer is being employed to repair an air tube. This particular type is made to work with an ordinary 4-volt accumulator, and the current required is under $\frac{1}{2}$ ampere-hour, at four volts for each square inch of repair. The apparatus is extremely simple, no thermometer or other recording instrument

being required. To work the appliance the Vulcanizer is connected by means of the flexible wire cord, shown in the illustration, to the accumulator, and in about three minutes the necessary heat, 270 deg. Fahr., is obtained. It remains uniformly at this temperature during the operation. In executing repairs the device will be found quite cool when handled, as all the heat is confined to the vulcanizing plate only, so that dissipation of the heat generated is reduced to a minimum, while economy in the current consumed is effected. The makers are sending out their useful appliance complete with the necessary vulcanizing materials, clamp, scissors, rasp, and all accessories; and the instructions are so easily followed that the ease and simplicity of operation may be regarded as further points in favour of Messrs. Gornall's Electric Vulcanizer.

THE Accident Insurance coupon which has been identified with the diaries and pocket-books of Messrs. Charles Letts and Co., 3, Royal Exchange, London, E.C., since 1895, has proved a most popular feature, no less than 200,000 insurance registrations in connection with this firm's annual publications having been effected. The various diaries for 1909 indicate that the publishers are determined to keep well to the fore in this connection, their self-opening pocket diaries, leather cases, &c., being of excellent quality and well designed with a view to facilitating reference to the memoranda made. Several varieties of these pocket publications are before the public, and the varied selection gives opportunity for everyone to find something suited to his particular needs.

THERE will be no motor exhibition in Ireland during 1909, the Irish A.C. having abandoned the idea of holding the same.

A MOTOR-CAR driver has been charged at Epsom for permitting another person to ride on the driving box. Pleading ignorance of the law, his case was dismissed on the payment of costs.

THE "Douche Pneu," described and illustrated in our report of the Paris Salon, is, we learn, being introduced into this country by Messrs. Woollett, Airey and Co., Ltd., 28-30, Lime Street, London, E.C.

THE Canterbury Farmers' Club has passed a resolution asking the Motor Union, and also the Central Chamber of Agriculture, to call attention to the way in which some motorists drive along the centre of the roadway until quite close to an approaching vehicle.

THE commodious establishment for automobiles which Mr. P. M. Carmichael is erecting in King Street, Brighton, should prove of great convenience to motorists visiting London-by-the-Sea. It will be known as the Prudential Garage, and will shortly be made the occasion of a public opening.

FROM Ariel Motors comes a copy of the 1909 catalogue of Ariel cars; this is a very handsome production and contains full descriptions, together with many illustrations of the various types of Ariel cars that are being turned out for the 1909 season, and some particulars of which have been given in our report of the recent Exhibition at Olympia.

A NEW booklet, "All About Speedometers," has just been published for Messrs. W. Searle and Co., of 33, Glasshouse Street, W. It, of course, deals particularly with the design and operation of the "O.S." first-prize speedometer, but will be none the less interesting on that account, and the general matter included should prove instructive to all present or potential users of speed and mileage recording instruments.

WE learn from the Société des Pétroles de Groeniy (Russie) of 107, Leadenhall Street, E.C., that the P.G.R. motor spirit is now being supplied in three grades, viz., light with a specific gravity of .700 to .710; ordinary, .720 to .725; and heavy, .750 to .760. Arrangements have also been completed whereby the spirit can be obtained from all the principal garages and ironmongery establishments throughout the country.

THE Electrical and Motor Company, of Banbury, have opened a depot, for the convenience of tourists, opposite Banbury Cross, where they will keep a stock of petrol, oils, grease, tyres and accessories. They have no garage accommodation there, but a vulcaniser has been fitted up and the place is in touch with the company's main depot, where they have accommodation for fifty cars, and an up-to-date plant with competent mechanics.

REPLYING to the deputation from the L.C.C. which waited upon him to advocate the setting up of a traffic authority for London, the Premier promised careful attention to the point raised. The Government now had the advantage at the Board of Trade of having the skilled advice of the new Traffic Department. The Home Office was also interested, as was the Local Government Board and the Board of Trade, and no conclusion could be come to without a consultation between those Departments.

THE Anglo-American Oil Company, Ltd., 22, Billiter Street, London, E.C., are adopting new brand names for their spirit. Pratt's spirit will be known as Pratt's Perfection Spirit, and their 760 spirit will in future be called Anglo's Taxibus Spirit. The company have arranged to have these brands sealed with a new "silver" seal, and an item of interest to readers is the fact that they are now giving 5s. for every 100 of these seals returned.

WE learn from the Continental traffic manager of the London, Brighton, and South Coast Railway, that a crane capable of lifting five tons has now been installed on the quay at Dieppe, opposite the berths of the Newhaven-Dieppe steamers, thus enabling motor-cars to be shipped and unshipped at Dieppe as well as at Newhaven, irrespective of the state of the tide. This has added greatly to the convenience of the route, the more so as cars not exceeding 30 cwt. are conveyed by any of the passenger boats, while those exceeding that weight can be carried on the majority of the steamers.

The Olympia Show.

(Concluded from page 858.)

IN concluding our report of the recent show at Olympia it may be mentioned that instead of endeavouring to compress it into a single issue by giving brief and necessarily incomplete notices of the exhibits, we have preferred, for the sake of many of our readers who were not able to visit the exhibition, to deal at greater length with the vehicles on view that comprised points of interest.

The Lorraine-Dietrich Voiturette.

An interesting addition was made during show week to the stand of the LORRAINE-DIETRICH COMPANY, in the shape of a little car, illustrated in Fig. 94. The vehicle, which has been introduced to meet the demand for a speedy two-seated machine, is fitted with an engine, the

Fig. 94.—The Lorraine-Dietrich 10-h.p. Two-Seated Car.

four cylinders (65 mm. bore by 110 mm. stroke) of which, together with the admission and exhaust piping, are cast in one piece. As will be seen from Fig. 95, the valves are operated by an enclosed overhead cam shaft driven through a vertical spindle and gearing at the front end of the motor. The latter, which is rated at 10-h.p., normally runs at 1,500 revolutions, but is capable of running much faster, and consequently developing greater power. The transmission is through a disc clutch, four-speed gear-box, to a live axle. The cardan shaft is supported by ball bearings in a steel tube, which acts as a torque rod. An improved type of universal joint, which is completely enclosed and self-lubricating, is fitted at the front end of the shaft. The live axle is enclosed in a sleeve constructed of two pressed steel pieces bolted vertically together at the top and bottom, a system which combines relative lightness with extreme rigidity.

The Pilain Cars.

Three examples of Pilain vehicles were shown by Mr. E. D. HEINEMANN—viz., 18-h.p., 24-h.p., and 35-h.p., all provided with motors having four cylinders. The 24-h.p. was fitted with a very handsome limousine body, a notable feature of which is that all the accessories, including the lamps, are locked in position, so that there is little likelihood of any of them being stolen, the owner of the car retaining one key for the lot. The 35-h.p. touring car is also an attractive vehicle; it is built somewhat lower than usual, giving it a very comfortable and speedy appearance. On both the foregoing vehicles the transmission from the clutch to the gear-box is by means of a cardan shaft. Four speeds are provided, both the third and fourth being direct drives. This is obtained by dog clutches engaging with the respective bevel pinions. The third-speed bevel-pinion shaft is, in fact, a sleeve fitting loosely on the main shaft carrying the fourth-speed bevel, and of course engages with its particular crown wheel carried on the differential shaft. The latter is provided with universal joints at each end, through which power is conveyed to short cardan shafts on each side, which in turn convey power to the rear road wheels through the intermediary of a spur wheel engaging with an internally-toothed ring rigidly fixed to the wheels. The 18-h.p. car, which is an entirely new model, is provided with a somewhat novel form of transmission. The rear road wheels are supported on a fixed axle, which curves towards the rear. The gear-box is located much nearer the end of the frame than usual, and is built up in one with the differential case, from the side of which extend short cardan shafts, passing through the hollowed ends of the

fixed axle into the hubs of the rear road wheels, which they drive through the medium of special joints. There are many other points of interest in the Pilain cars, the designer of which has apparently endeavoured to get away from the conventional lines of transmission by means which appear to be giving excellent results in practice.

The Belsize Cars.

Among the cars that have steadily gained in popularity during the past few years are those of BELSIZE MOTORS, LTD., Manchester. The vehicle which is attracting considerable attention at the present time is the 14-16-h.p. four-cylinder, which is noticeable for its extremely moderate price. A few slight changes have been introduced in the chassis for the 1909 season. The four cylinders (90 mm. bore by 101 mm. stroke) have the valves all operated off a single cam shaft. The water circulation is by thermo-syphon, while the mixture is furnished by a White and Poppe automatic carburettor. Special attention has been devoted to the question of engine lubrication, which is now maintained by a gear-driven pump. The transmission is through a metal-to-metal cone clutch and three-speed gear-box, giving a direct drive on top to the live axle. The brakes are arranged reversely to the usual method, the pedal actuating those on the hubs of the rear road wheels, and the hand lever a wide brake at the back of the gear-box. A new model is the 28-h.p., which follows the usual Belsize lines; in this case, however, the valves are arranged on opposite sides. Two systems of ignition are fitted, while a clutch of the Hele-Shaw disc type transmits the power to the gear-box. Other Belsize cars include a 20-h.p. four-cylinder and a 40-h.p. six-cylinder.

The Roydale Cars.

The ROYDALE ENGINEERING COMPANY, Huddersfield, were present with two polished chassis of the Roydale vehicles of respectively 18-22-h.p. and 25-30-h.p., both having engines the four cylinders of which are cast in one piece. There are many points of interest in these vehicles, among them being an automatic carburettor with variable choke tube, which is very simple in its action, while allowing the mixture to automatically adjust itself according to the speed of the motor. Ignition is by Simms-Bosch gear-driven high-tension magneto, accumulators and

Fig. 95.—View of Engine of Lorraine-Dietrich 10-h.p. Light Car.

coil being provided as a reserve ignition system. The throttle is arranged to be operated in three ways—by a hand lever on the steering wheel, by an accelerator pedal, and automatically when the clutch is withdrawn. The gear-box furnishes three forward speeds, with a direct drive on the top, through a double-jointed propeller shaft to a live axle. The shafts of the gear-box run on roller bearings, while the universal joints are entirely enclosed and run in oil.

The Valveless Car.

Since we described the Valveless car, in our issue of November 30th, 1907, the makers, VALVELESS, LTD., while retaining their special type of two-cycle engine, have entirely redesigned the vehicle, which now in general appearance closely follows the lines of a standard live-axle machine, the motor being located under a bonnet in the front portion of the frame. The exhibit comprised a 25-h.p. chassis, and a vehicle of similar power fitted with a handsome limousine body. As regards the motor, it may briefly be mentioned that it has neither valves,

Fig. 96.—Front View of Chassis of "Valveless" Car, showing the two-cycle engine and the cross-shaft actuating the magneto, the oil pump and the water-circulating pump.

valve tappets, nor cam shafts. Two vertical cylinders ($5\frac{1}{2}$ in. by $5\frac{1}{2}$ in. stroke), placed side by side, share in common a single combustion chamber, carburettor, air-tight crank case, inlet port, exhaust port, and ignition. Each cylinder has a piston, each operating its own crank shaft; the latter revolve in opposite directions, and are geared together by teeth cut on the disc webs. The action of the engine is such that while one charge is being used in the cylinders another is being prepared in the crank case, so that explosion takes place at every revolution, as against every other revolution in the ordinary four-cycle engine. The ignition is by high-tension magneto, and, as the two cylinders have a common combustion chamber, only one sparking plug and one wire are necessary. The lubrication is effected by a special valveless pump, driven, like the magneto and water-circulating pump, by a cross shaft in front of the engine, actuated by skew gear off one of the crankshafts, the latter being slightly *desaxé*, and also mounted on ball bearings. The normal speed, at which 25-h.p. is developed, is 1,000 revolutions, but the engine, which is stated to comprise only six working parts, is capable of considerable acceleration. The transmission is through a leather-faced cone clutch and a gate-controlled gear-box, giving a direct drive on the top speed to the rear live axle. One of these vehicles was recently submitted to a 1,000-mile trial under the observation of the R.A.C., in which the involuntary stoppages only amounted to one minute. The petrol consumption worked out at 19.1 miles per gallon, and that of lubricating oil .7 pint per 100 miles. We understand that arrangements have been concluded whereby Messrs. David Brown and Sons, Huddersfield, are taking up the construction of the cars for the Valveless Company.

The Straker-Squire Car.

For the 1909 season Messrs. STRAKER AND SQUIRE, LTD., are confining their attention to a single type of chassis—a 14-16-h.p., which, introduced about a year ago as the "Shamrock," is now known as the "Straker-Squire." The motor comprises four cylinders cast in pairs, 87 mm. bore by 85 mm. stroke, the valves being arranged on one side. The ignition is by high-tension magneto, provision being made for installing coil and accumulators as a reserve. The water circulation is on the thermo-siphon system, no pump being employed. The clutch is of the leather-faced cone type. The gear-box is adapted to give three forward speeds in addition to the reverse, the transmission being by

cardan shaft and bevel gear to a live axle. The latter is specially designed to give ample strength together with immediate accessibility. The differential case consists of a solid steel casting with a large door in front. In order to take out the differential, it is only necessary to remove the hub caps, withdraw the driving shafts, take off the large plate at the back of the case, when the bevel and differential gear can be withdrawn. The complete cars on view included a two-seater, a four-seater with Roi des Belges side-entrance body, a single landaulet, and a light runabout having two comfortable bucket seats, tool-box, luggage rail and wind shield.

The Stella Car.

Coach work of a notable degree of finish and incorporating some interesting points was shown by Messrs. E. and H. HORA, LTD., of Peckham Road, London, S.E. On a four-cylinder 16-h.p. Stella car was a good type of landaulet, with extension canopy. A Stella low phaeton was shown, to which the firm's "Perfect" hood was fitted, and the exhibits also included a good type of body for the use of doctors and a Roi de Belges phaeton on a Darracq chassis. Messrs. E. and H. Hora, Ltd., are making excellent bodies for the Stella car. In this the 16-h.p. engine has four cylinders, cast in pairs. The mechanical valves are interchangeable. A float-feed multiple-jet carburettor is fitted, and regulated by a lever on the steering wheel and accelerator, both being fitted. Ignition is by low-tension Simms-Bosch magneto, although the high-tension type can be fitted if desired. The clutch is of the leather-faced external cone type, and transmission is by cardan shaft from the gear-box, which has three speeds and a reverse, worked by a lever in a "gate." The chassis is fitted with three brakes and with coach work by Messrs. E. and H. Hora should prove popular.

Jackson Cars.

Messrs. REYNOLD JACKSON AND CO., LTD., showed their 8-h.p. single cylinder Jackson's doctor's car, a chassis of the same vehicle, a dog-cart, and their No. 8 Jackson car. The latter has recently been illustrated in our columns, and has a racing look that is attractive. All the principal working parts are located under the bonnet, thus rendering the car very accessible. Speaking of the range of single-cylinder vehicles shown, they were fitted with De Dion engines. Transmission is by cardan shaft, and the direct drive on the top speed is attained by a device which throws all the other speed gears out of mesh when this is in use. An efficient and automatic system of lubrica-

Fig. 97.—Rear View of Chassis of "Valveless" 25-h.p. Live Axle Car.

tion has been adopted in connection with the bearings of the two shafts in the gear-boxes. This is secured by the provision of oil boxes, which are filled with oil; against these metal rings are carried, which, revolving with the shafts, convey oil to the bearings—a plan carried out on all the bearings on the car. The foot and hand brakes are double acting. The dogcarts are easily convertible into two-seated vehicles, and the doctor's cart shown was an equally useful vehicle. Those who are prospective owners of a small car will not fail to investigate the merits of the Jackson vehicles.

The Weigel Cars.

Interest was general in the exhibit of Messrs. WEIGEL MOTORS (1907), Ltd., which included four-cylinder chassis of 25-h.p. (110 mm. bore by 120 mm. stroke), 40-h.p. (130 mm. bore by 140 mm. stroke), and a six-cylinder 60-h.p., with 130 mm. bore and 140 mm. stroke. During the season special attention will be devoted to the 40-h.p. car. The cylinders of this are cast in pairs, with the carburettor fitted between the two. The valves are on both sides, and are interchangeable. The magneto is of the low-tension type, and driven off the timing gear on one side of the engine, the water-circulating pump being similarly driven on the other. Transmission is through a multiple disc clutch, the gear-box having four speeds on a gate change. The drive passes through a propeller shaft, universally jointed at each end, to the back axle, which is provided with a torque rod. In the 25-h.p. model high-tension magneto is adopted, and the 60-h.p. is identical with the 40-h.p. model, with, of course, the difference in the number of cylinders.

The Vinot Cars.

Interest at the stand of Messrs. T. J. HARMAN AND CO. was centred on the chassis of the Vinot 16-h.p. car, some few particulars of which have already been given. The new vehicle is fitted with a four-cylinder engine, 80 mm. bore by 110 mm. stroke. The valves are all operated off a single cam shaft, and in order to render them more accessible, the carburettor is located on the opposite side, and the admission pipe brought over the top of the cylinders. The ignition is by Bosch high-tension magneto, and the mixture furnished by a carburettor of the Claudel automatic type. The control of the motor is by a single lever acting on the throttle, the ignition being fixed. The water circulating pump and high-tension magneto, which are driven off one shaft, are so arranged that either can be readily detached without disturbing the other. The Vinot patent clutch and gear-box are fitted, the latter giving three speeds. The final transmission is by a propeller shaft and bevel gear to a live axle of exceptionally strong design, it being similar to that employed on the firm's "four-inch" car. The motor is claimed to not only be economical—the petrol consumption being 30 miles to the gallon—but extremely flexible, it being able to drive the car on top gear at any speed from five to 45 miles per hour. Other cars on view included a 16-h.p. landaulet suitable for doctors and town use, a 16-h.p. side-entrance car, and a 24-h.p. fitted with a special "all-weather" body by Salmon and Sons. When the body is closed, the whole of the occupants of this vehicle, including the driver, are sheltered from wind and weather, while a window that extends across the whole width of the carriage enables the back portion to be closed while the front is open, or vice versa, the driver and his companion on the box-seat can be enclosed while the back is entirely open.

Messrs. Cole's Coach Work.

Some idea of the skill and art which has been introduced into motor-body building was shown by Messrs. W. COLE AND SONS, LTD., 92, High Street, Kensington, London, W., whose display was a most artistic one. The central feature was the landaulet-limousine on a 14-20-h.p. Renault chassis—a most effective body, that stood out well in its rich blue colouring, with rails of a somewhat lighter hue, and picked out in black and white fine lines. Apart from the colouring, the sweep of the lines and the graceful outline of the body was notable even in a section where the whole range of coach work was really noteworthy. It was fitted with a wind screen, secured with a half turn of a thumb screw. The other exhibit was a limousine of equally good and bold design on a 30-40-h.p. four-cylinder Ariel. A fitment in connection with this merits mention, viz., a carrier for spare tyres, which is bolted to the footboard. It is detached or attached by unhooking a chain, which allows the hinged side to fall away.

Coachwork from Reading.

Among the excellent displays of carriage work which were shown in the Annexe, the exhibit of Mr. W. VINCENT, of Reading, was conspicuously noteworthy. This gentleman has specialised for some years on high-class motor bodies, which deserve to be designated as carriages, and evidence of his taste and skill in that direction was forthcoming in the luxurious limousine body fitted to an 18-h.p. Panhard 1909 type. Arranged to carry five persons comfortably inside, it proved commodious as well as attractive in appearance. The inside was full of refinements, such as flower-holders, plate-glass windows, an artistically moulded ceiling coloured to match the dove-grey upholstery—altogether a rich example of coachwork. The 18-20-h.p. Unic, with cabriolet body, on the same stand, was easily convertible to either an open or closed carriage, and was shown fitted with a "Reading" collapsible wind screen.

SOME ACCESSORY EXHIBITS.**The Shaw-Kirsop Detachable Rim.**

One of the most simple of the detachable rims shown in the Gallery was that which drew special notice to the stand of the HUTCHINSON TYRE COMPANY. This is known as the Shaw-Kirsop detachable rim, by the adoption of which the detachment of the tyre, the insertion of a new tube, and the replacement of the device is accomplished within a minimum of time, two minutes being allowed the operators on the stand. This is done by the use of the expanding

**Fig. 98.—The Shaw-Kirsop Band.**

and contracting band shown in Fig. 98. This is an auxiliary device, and is, as will be seen from the illustration, provided with a number of incurved hooks or lips, which engage with the thickened edges of the tyre. In Fig. 99 we show the wheel, to which one part of the rim itself is permanently shrunk on. The second portion is detachable. Operation is simple; the tyre attached to the band is pushed on to the permanent part of the rim, and when it is placed in position the detachable part of the rim is inserted, and locked automatically with the spring-controlled bolts shown on the wheel. The security

**Fig. 99.—The Shaw-Kirsop Detachable Rim.**

bolts are fixed to the bands, and the whole device attains a degree of security that is highly satisfactory. It will be noted that no tools are required, the means of fastening all being provided on the wheel itself, while the absence of loose parts is much to be commended. Further, an auxiliary band can be carried with a spare tyre without any difficulty; the band weighing, with the four security bolts, only 2 lb. When it is fixed the rim is practically watertight, this preventing all risk of damage to the tyre beading by wet. We understand

that before being brought forward into public view the Shaw-Kirsop rim has undergone a series of tests on a 40-h.p. car, with results that have justified its confident introduction by the Hutchinson Tyre Company.

Bowden Specialities.

Motorists always show keen interest in the display staged by the E. M. BOWDEN'S PATENT SYNDICATE, of Gray's Inn Road, London, E.C., who generally take advantage of the show to introduce useful novelties to the public. Many of the exhibits were familiar, particularly Miraculum, which is known in connection with punctured tyres; the Bowden automatic air inlet, which has proved its economy so far as the consumption of fuel is concerned in many public competitions; the well-known petrol strainer of the firm; and the Bowden wire mechanism in its various forms. The exhibit included several adaptations of the mechanism for the service of motorists, among them being wheel controls, carburettor agitators, and the like. A new steering wheel control lever working in ratchet segments was shown.

Lowe, Bevan's Wind Screens.

One of the most comprehensive collections of body builders' ironmongery and fittings for motor-cars was that made by Messrs. LOWE, BEVAN AND Co., of the Clarence Works, Birmingham. Several new designs of folding wind screens were staged, the special novelty being "The Royal" patent wind screen, which is suitable for landaulet or limousine bodies. This is illustrated in Fig. 100, and, as will be apparent, is so made that the front folding glass can be set forward at any angle. This is done in a very simple way with a single move-

Fig. 100.—"The Royal" Wind Shield.

ment, there being no screws to release or tighten up. It is simply pressed forward to the desired position, and there, as will be seen, it will remain. It works equally well in the opposite direction, when the swinging glass can be stored away in the roof of the canopy. As a simple and useful wind screen "The Royal" is one of the best things of the kind that was in the Show. Another excellent type was the "Kenilworth" folding wind screen, the fittings of which are so arranged that the bottom half of the screen can be regulated at any required angle, or the bottom half can be placed in an upright position and the top portion half-angled towards the steering wheel. It can be used as a straight screen or half folded down to form a half screen. All these combinations are easily manipulated, and the "Kenilworth" will doubtless be seen on many cars during the coming season. Several other types of screens were shown, as well as various patent fittings. We noticed in connection with the latter that the firm are making a point of producing these in oxydised metal as well as in brass, these being to meet the demand for a quieter appearance which is apparently coming along.

The Aster Engines.

On the stand of the ASTER ENGINEERING COMPANY, LTD., of Wembley, Middlesex, was seen a complete range of the Aster engines, a new type of carburettor, and various components of the high grade character associated with the Aster name. The engines ranged from those of 9-h.p. single-cylinder to 35-h.p. four-cylinder. Chief interest centred in a new 14-h.p. four-cylinder engine. The cylinders are all one casting, their dimensions being 75 mm. bore by 100 mm. stroke. Mechanically

operated valves are fitted, the operation being by a cam shaft on the near side; the inlet and exhaust pipes are cast with the cylinder, without interference with the water jacket space. There is a removable driving flange at the rear end of the crank shaft, enabling it to pass through the rear main bearing. The connecting rods are fixed to the bearings by means of studs and nuts. An oil gear pump at the rear end of the crank chamber oil sump is provided for lubrication. The Eisemann high-tension magneto is carried on a bracket on the near side of the crank chamber. On this stand, too, was the "Aster" carburettor, made under Hamilton's patent. In this the throttle valve is incorporated in the device forming part of the carburettor, and thus making it thoroughly self-contained. This throttle valve consists of a barrel with suitable ports cut in it. This slides horizontally inside the body of the carburettor, regulating simultaneously the quantity of mixture passing to the engine and the quantity of air admitted to the vapourising chamber. The air valve is readily adjustable to any changed condition in the weather, and an automatic air valve is also fitted to compensate for any sudden change of depression due to rapid acceleration, thus preventing any tendency to choking, and securing smoothness in running.

United Motor Industries.

Already we have illustrated one of the specialities shown by the UNITED MOTOR INDUSTRIES, LTD., 46, Poland Street, London, W., viz., the Simplex speedometer, which, with its clockface on the same dial as that travelled by the speed indicating pointer, presented an interesting novelty. We would now conclude our review by mention of the "County" wind screen, the "L.M. de Luxe" porcelain plugs, the "Wagner" electric horn, the "Bousfield" silencers, the "Castle" accumulators, the "Castle" condenser induction coils, and other excellent and standard accessories of which the "Eisemann" self-contained magneto is not the least interesting. This new type of magneto, which the United Motor Industries, Ltd., represent in this country, is distinguished by the strength of the spark, the compact form, and the high-class finish. A system of dual ignition has also been introduced, the contact-breaker for the magneto current being also used for the battery circuit. The induction coil for the latter is mounted in a case also containing the switch. The handle of the latter is in the form of a push-button, which thus enables the device to be a self-starter. Mr. G. H. Smith also showed us the "Castle" accumulators, which are now being fitted with a new plate fastening. All the plates are separated at the top and bottom by lugs which project from the plates into round holes in the perforated celluloid which is placed at each end, upper and lower, of the plate. Thus held, the usual separators become unnecessary, and the arrangement secures greater efficiency being obtained from the plates. The "Castle" accumulators are provided with a new terminal that is absolutely non-corrodible and—a new feature—bear a label with the actual capacity rate as decided upon by the S.M.M.T. The wind shield has a simple and excellent arrangement for the prevention of rattling sometimes associated with devices of the kind. In the channel of the wooden frame in which the glass is fixed is placed a cloth bed, upon which the glass rests, with a lining of soft phosphor bronze to even more effectually prevent the effects of the vibration to which a wind shield is normally exposed.

Prested Electrical Specialities.

To motorists the PRESTED MINERS' LAMP COMPANY, LTD., of Elthorne Road, Holloway, London, N., are well known owing to the first-class reputation they have enjoyed in the motor world since they began to cater for its requirements. Their display included electric lamps, charging boards, switches, high and low tension cable, &c., as well as the Prested battery, coil, plug, and commutator, and a new combination set for standard or supplementary ignition. Mention may be made of the four-cylinder synchronised coil, which secures a fierce spark with a low consumption of current. Type A was the model on view, and is a good pattern of coil. In this type each unit is self-contained, fitted with its own trembler and condenser, and is interchangeable. For light cars the Prested Company have brought out a type B, in which the spark is equally as fierce as in the one just referred to, and the consumption is economical, but the units are not interchangeable. This pattern is only 4½ in. from the back to the front—a point worthy of consideration in cases where the distance from the dashboard to the driver's seat is not great. In the Prested batteries for the new season an improved plate of great capacity is fitted. They are also fitted with a patent lead, making the corrosion of the terminal from creeping of the acid impossible. Every plate is laterally supported, so that the battery can withstand any vibration to which it may be subjected. We would add a word about the Prested

spark plug, which has been before the public many years, winning continuous confidence from motorists of a practical bent, one of whom has ridden 25,000 miles, always using the same plug, one of this make.

Garage's Mecca.

Naturally motorists expected to find a full selection of accessories of every description at the stand of Messrs. A. W. GAMAGE, LTD., of Holborn. It was not inappropriately termed the Motorists' Mecca, the exhibits comprising clothing for drivers of all degrees, trunks and other touring conveniences, speed indicators—of which the firm have a full selection—tyres and non-skids, lamps, horns, wind screens, and, in fact, everything, from jacks for hoisting the car to spare tyre cases for attaching to the top. Nothing seems too small for this firm to handle, and any ingenious idea for the convenience of motorists seems to be within their ken. Thus they showed a simple umbrella clip, which is screwed on to the interior of a car, in order to save the paint work from being scratched. In rear lamps, too, were several good ideas, including that known as the Colmore. This is constructed so that in the event of the door being thrown open by vibration or any other cause the burner is not likely to be lost, as it is secured by a screw. Not, perhaps, a great point, but one of those little fitments that mean much to the motorist. Most of the standard accessories which have become known both to private owners and garage proprietors were on this representative stand.

The Rotax Specialities.

Preliminary announcements prepared the public for the novelties at the stand of the ROTAX MOTOR AND CYCLE COMPANY, of Great Eastern Street, E.C. They proved a really interesting collection, notable among them being the vulcaniser, the lamp bracket, foot warmer, and the collapsible steps already described and illustrated in our columns. With regard to the latter, the further illustration in Fig. 101 will be of interest, this showing the device when collapsed and out of the way.

Fig. 101.

The Rotax synchronised coils were also on the stand, and attention may be directed to the accumulators of the firm, in which celluloid separators are adopted, to obviate the possibility of short-circuiting. For this department the company issue a special list, entitled Rotax Ignition, which, with its wiring diagrams, as well as illustrations of other standard devices, will be of great service to motorists generally. Several new designs in lamps were on view, as well as an assortment of motor body and coach builders' fittings.

The Barker Tyre.

The Barker tyre is distinguished by its strength and also its durable qualities. The feature in construction is not only that the canvas embodied has four times the tensile strength of the fabric usually employed, but the grooves which occur laterally across the tyre are supplemented by others placed longitudinally in pairs between these. This excellent device was shown on the stand of Messrs. MACINTOSH AND SON, but is being marketed by Messrs. JOHN BARKER AND CO., LTD., of Kensington, W.

The Ajax Non-Skid Tyre.

At the stand of the MIDLAND RUBBER COMPANY, LTD., of Birmingham, who introduced the Ajax detachable rim, was the Ajax non-skid—a very sensibly-arranged combination of rubber and metal. On the outer edges of the tread are continuous rubber ribs all around the tyre; on the inside of these are rows of rubber studs, while the central space is occupied with a row of special triplicate metal studs. In addition the company showed examples of their armoured tyres, fitted with hardened steel studs of the ordinary type.

Challiner's Rim.

From Kay Street, Ardwick Green, Manchester, came the SHREWSBURY AND CHALLINER TYRE COMPANY, LTD., with a selection of their specialities in carriage and wheel work. Several excellent artillery pattern motor wheels were on view as well as an assortment of tyre

accessories, mainly in connection with the firm's own tyres, covers, &c. The Challiner patent detachable rim has become a familiar feature of these shows, and its merits are receiving increasing recognition from motorists. Its essential features are a fixed rim with a detachable side which is fixed by means of eight nuts. These removed, the tyre on the rim can be promptly pulled away. The device is easily attached or detached, while it is equally satisfactory on the ground of security.

The Jenatzy Tyres.

Messrs. H. M. HOBSON, LTD., had an exhibit of the Jenatzy tyres at their stand in the Gallery. The merits claimed for this tyre are resilience, strength and durability—qualities obtained by the use of special rubbers and fabrics in building up the tyre. A speciality on the stand was the Jenatzy-Houben non-skid cover, which is made with a patent tread composed of alternating hardened steel rivets and leather washers—a plan which is claimed to entirely prevent skidding. Several accessories in connection with tyres were also on view, the firm being well able to undertake repairs and replacements from their establishment at 29, Vauxhall Bridge Road, London, S.E.

Miscellaneous.

The Siemens Obach dry cells for use with Siemen's ignition coils were exhibited by Messrs. SIEMENS BROS. AND CO., LTD., whose display also included high and low tension motor-car flexible leads in standard sizes.

An interesting display was made by Messrs. DAVID MOSELEY AND SONS, LTD., of Manchester, who showed their tough grey inner tubes, as well as their "detachable" tyres, both of the plain and studded non-skid variety.

The ACETYLENE ILLUMINATING COMPANY, LTD., drew attention to their dissolved acetylene lighting outfits for service on automobiles, and also showed the "Sioco" tyre inflators and other well-known adjuncts to automobilism.

At the stand of the SELF-SEALING RUBBER COMPANY, of Ryland Street, Birmingham, was a motor tyre with a flat tread, the feature of which consists in the longitudinal groove and also lateral ones, securing the tyre against any propensity to side slip.

A useful display of electrical accessories was made by Messrs. THOMSON-BENNETT, LTD., of Heneage Street, Birmingham, their fittings including the standard wipe type of distributor, the new "Arden" plug, and several other specialities of good design and finish.

A goodly collection of accessories was staged by the MOTOR ACCESSORIES COMPANY, of 55, Great Marlborough Street, these including the "Mac" specialities, among which were whistles, jacks, luggage carriers, generators, horns, &c. The Fanfare headlight was also on their stand.

Pneumatic tyres of the Gaulois make were shown by Messrs. GAULOIS TYRES, LTD., of 60, Great Marlborough Street, London, W., who also exhibited the Gaulois-Ferre non-skid tyres and the Gaulois air tubes. Here, too, was the Doolittle detachable rim, made by the company of that name at Fleet Street, Coventry.

Ball-bearings of the "F. and S." type were the speciality on the stand of the "TORMO" MANUFACTURING COMPANY, of 67 and 68, Bunhill Row, London, E.C., whose exhibits also included balls in copper, phosphor bronze, gun-metal, and brass. The bearings have a cage with helicoidally cut grooves, by means of which the balls are sprung into position.

Much interest was evidenced in the carburettor introduced by Messrs. BROWN AND BARLOW, LTD., of Birmingham, who made a useful display of their specialities. These are adaptable for engines ranging from 3 to 4½ in. in the bore, and from one to six cylinders. The device has four main parts, the float chamber, the base of the spraying chamber, the carburettor chamber proper, and the hot-air inlet—evidence of the simplicity of the device.

Mr. E. J. HARDY, of Bishop Street, Coventry, who is the agent for the Longuemare carburettor, made full use of his stand to make a bold show of the many goods which he handles. These include the Guenet coils, fitted with Carpentier tremblers, the "Godiva" mica-porcelain plugs, "Dependence" lamps, voltmeters, and the fifty and one instruments of similar character now available in connection with motor-cars.

WE understand that not only has the London and Paris Exchange Motor Agency, Ltd., recently received a large number of inquiries concerning the conversion of second-hand cars into light delivery vans, but that they have received numerous orders from medical men who are now adopting motor vehicles for professional purposes.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

NEW MOTOR-CAR LICENSING PROVISIONS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—I have not as yet seen any reference to the great change made by the Finance Act of this year in respect of certain Inland Revenue licences, and as motor-car owners are much interested I am sending you a resume of the provisions. The amounts received for carriages, motors, dogs, armorial bearings, male servants, gun licences, game, &c., have hitherto been collected mainly by postmasters and sent to the Inland Revenue authorities. On and after January 1st, 1909, all such licences must be taken out at post offices and the amounts paid in to the county council or county borough in which the post office is situate, instead of the Inland Revenue Department, as at present.

The control is transferred from the Treasury to the county and county borough councils, who will take the whole of the proceeds. These councils, therefore, in addition to the fees for driving licences and for registration of motors, will have a direct interest in the other licences, taking the whole of the money. May we hope, when these authorities realise how much motorists pay for licences, that they will cease to agitate for more road upkeep? The exchequer contribution which has hitherto been paid by the Treasury to the local authorities will, of course, cease on December 31st this year. The Act will come into operation on January 1st, 1909. The forms for licences must be requisitioned from the Local Government Board. Envelopes and special printing, &c., will not be supplied by the Local Government Board. Enquiries as to licences, &c., to go to the clerk to the county council or to the town clerk in a county borough. Some system of intercommunication between councils to be established to prevent fraud, &c.

The Village Cage, Lingfield, Surrey.

The Cage was once used as a temporary lock-up for drunk or disorderly persons.

Registers to be kept by the councils.

Records of Inland Revenue officers are to be at the disposal of the councils.

Certain notices are to be posted on church doors.

A return of penalties inflicted and duties repaid to be sent to the Local Government Board annually.

The money is to go to the council in which the post office is situate where the licence has been obtained, without regard to residence.

The council must detect and prosecute offenders and appoint officers for the purpose.

The council is not to be subject to the control of the Treasury.

There are no restrictions as to arrangements to be made by the councils.

Councils may delegate their powers to a committee.

The councils must send out the forms for the licences.

All the powers of the Inland Revenue Commissioners are conferred on the councils except the printing and prescribing the forms, issuing the licences, and the power of distraint and arrest.

The public to be subject to the same obligations and penalties to officers of the Corporation as now to Revenue officers.

A weekly return of licences granted to be sent to the councils by the various postmasters.

The Postmaster-General will remit to the councils from time to time the amounts received for licences.

£40,000 to be distributed among the county and borough councils to cover cost of collection.

Part of the penalties to go to the council and part to the Police Superannuation Fund.

Notices of exemption granted at petty sessions to be sent to the council by the clerk to the justices, and the council thereupon to give a certificate.—Yours truly,

T. SCOTT FOSTER.

Chairman of Finance Committee of the Portsmouth County Borough Council.

CLEANING OUT ENGINES WITH PARAFFIN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reading "Thermo's" enquiries in the *M.C.J.* of the 21st ult., as to cleaning out engine crank chamber, my plan of action may be of assistance. I have a 20-h.p. four-cylinder car; the drain plugs to the crank chamber are awkward to get at, as the tray under the engine extends to behind the universal joint of the cardan shaft, and the ports of the chambers are not large enough to get my hand in to clean out. I use an ordinary garden syringe with jet nozzle which does the job perfectly, viz., I first suck out the dirty oil by placing the syringe through the ports and draw a charge in, then discharge the contents into any old tin, repeating the action so long as any oil can be extracted. I then have about a pint of paraffin and squirt it with the syringe into the chamber, using all force, repeat this, filling the syringe from chamber; when the inside has had a good washing extract the paraffin in the same way as the oil was taken out. To finish the job I take a cloth and rub it round the inside with a stick; this absorbs any paraffin left by the syringe and leaves the crank chamber perfectly clean; it takes a very short time to do and almost without soiling the hands.—Yours truly,

E. HARCMBE.

ELECTRIC LIGHTING FOR MOTOR HOUSES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The desirability of electric lighting for motor houses, especially in country parts or out of way districts, even if only on a small scale, must have frequently occurred to those attending to their cars during the winter season; especially where petrol may be stored or danger from fire increased. If it were possible to employ the same for charging accumulators, a two-fold benefit would be derived by those who for various reasons may discard gas engines and dynamos. Will some readers who may have had some experience in this direction kindly reply?—Yours truly,

ALF. DIXON.

THE TENDENCY OF MOTOR-CAR DESIGN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to see the outspoken remarks in the last issue of the *M.C.J.* with regard to the general tendency of design in motor-car construction, and the arguments you brought forward in support of the plea that greater attention should now be paid to the production of a vehicle which, while being reliable, should be as simple as possible. I paid several visits to the Olympia Show, and came away with the impression that motor-cars are not yet being built for the general public, but only for those who have a mechanical turn of mind. For my part I fail to grasp the reason why the British automobile designers look so disdainfully on the simple epicyclic or planetary type of change-speed gear, which has for years found many supporters on the other side of the Atlantic. It has been urged that the British motoring public would not use cars fitted with this class of gear, and that it is useless to try and force them to adopt it. With this view I entirely disagree. There are, of course, buyers of cars who are extremely critical as to the details of their construction; there are thousands of prospective owners who care nothing for such matters—all that they desire is a simple car that they can rely on to take them whither they wish and to bring them home again—putting their reliance in the high standing of the firm they purchase the car from that the engineering portion of the car will not only be fully equal to the work required of it, but will be of so simple a design as to require a minimum amount of attention.—Yours truly,

W. J. DEWSBURY.

MESSRS. BELL AND SMART have opened at 48 and 50, Tottenham Street, Tottenham Court Road, W., large and admirably adapted premises for the repair and garage of motor vehicles. Mr. B. Bell, who was engineer to Argylls London, Ltd., and who also had practical experience in the works of Argyll Motors, Ltd., at Glasgow, will take charge of this department.

THE Vacuum Oil Company have issued an interesting souvenir of the International "Four-Inch" race for the Tourist Trophy, with portraits of the various competitors who used the vacuum oil in that event. From the letters which are included in the souvenir this oil evidently gave universal satisfaction. A copy of the brochure will be sent to all applicants to the company's headquarters, Norfolk Street, Strand, W.C.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE annual dinner of the founder members of the Club was held on the 25th ult. under the chairmanship of Mr. Roger Wallace, K.C. Between sixty and seventy founders were present. The toast of "The Founders" was proposed by Mr. J. W. Orde (the only non-founder present at the dinner) and was replied to by Mr. Claude Johnson, Mr. F. R. Simms, Sir Hiram Maxim, the Hon. C. S. Rolls, Mr. S. F. Edge, and Capt. F. E. Dyke Acland. Col. Holden, F.R.S., proposed the chairman's health, and an entertainment followed.

We learn officially that the South Wales and Monmouthshire Automobile Club, the Bristol and Gloucestershire Automobile Club, and the Bradford Automobile Club have decided to associate with the R.A.C. from January 1st next year, at the expiration of their present agreements.

RICHMOND.

THE annual dinner of the Richmond and District Motor Club has been held at the Trocadero Restaurant, London, with the vice-president, Dr. W. M. Paul, in the chair. After dinner the chairman urged the members of the club to consider the other users of the roads. He felt

M.I.Mech.E., who will read an address on "Some Features of the Exhibits of the London and Paris Shows." At 9 o'clock the gathering will resolve itself into a business meeting for the following purposes:— (1) To form a branch of the Graduates' Section in Coventry. (2) To elect a Graduates' Committee. (3) To draw up a provisional programme.

Particulars of the meeting and of the Institution and forms of application for admission may be obtained from the hon. secretary of the Coventry Centre, Mr. W. Morgan, c.o.; the Daimler Motor Car Company, Ltd., Coventry.

The second ordinary general meeting of the session of the London Branch of the Graduates' Section of the Incorporated Institution of Automobile Engineers was held on Tuesday of last week. The chair was taken by Mr. Chas. Wheeler, a member of the Council of the Institution. A paper was read by Mr. D. Kennedy on "Ignition Systems," illustrated by lantern slides and also by models of the various ignition systems. The discussion was opened by Mr. Percy Bishop, and Messrs. J. H. P. Daman, L. H. Baskerville-Cosway, F. Thomas, L. H. Hounsfeld, H. Burchall, C. E. G. House, and the chairman took part in the same.

The Scene Outside the Grand Palais, Paris, on the opening day of the Salon. The Clement-Bayard Airship is seen making a successful flight over the well-known building.

that it was the opinion of the members of the club that strong measures should be taken against any member who disregarded this wish of the club.

The captain, Mr. A. Carpmal, jun., returned thanks, and emphasized the appeal to the members to drive with extra care and consideration for the future. There was no doubt a very strong feeling had arisen amongst some of the public against motors and motoring, and although he felt this had been caused by the reckless and inconsiderate driving of a very small number of drivers, yet, unless something was done very soon to alter this adverse feeling, there was great risk of very repressive measures being passed.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE Council of the Incorporated Institution of Automobile Engineers has arranged for a general meeting of pupils, apprentices, and junior draughtsmen engaged in the automobile industry, and engineering students (both members and non-members) employed in Coventry, to be held on Tuesday next, at the works of the Daimler Motor Company, Ltd. The chair will be taken at 8 o'clock p.m. by Mr. Alex. Craig,

MECHANICS' CLUBS.

ACCORDING to the "Leeds Mercury," the secretary of the Yorkshire Chauffeurs' Association says that no member has been reported for furious driving or misconduct, and that owing to the support of various gentlemen all members will have their contributions returned during Christmas week, and an addition of 15s. 6d. bonus.

A club for motor-drivers and mechanics in Bromley, Beckenham and Chislehurst is being formed. At a meeting held at the Star and Garter Hotel, Bromley, it was unanimously decided to form such an organisation, to be known as the Bromley and District Motor Drivers' and Mechanics' Club. Mr. Allan was elected president, and Mr. Lawlor was appointed vice-president. Mr. Randell was appointed hon. secretary, and the following were elected a committee, with power to add to their numbers:—Messrs. F. Springett, E. Laws, Steer, Brittan and Kemp.

BEFORE the Basingstoke and District Motor Club, Mr. G. W. Watson read a paper on Saturday last on "The Scientific Adjustment of Carburettors."

THE Irish Club is endeavouring to put down inconsiderate driving in Ireland, and a case recently tried at the Dublin Police Court was

made the subject of prosecution mainly as a result of enquiries previously undertaken by the Irish A.C.

THE Cambridge University Motor Cycle Club have had a petrol consumption trial over a twenty-six mile course, the winners being Mr. B. M. Oliver on his 5½-h.p. Rex, and Mr. N. H. Joy on his 2½-h.p. Minerva, in the twin and single-cylinder classes respectively.

THE next ordinary meeting of the Society of Engineers will be held on Monday, the 7th inst., at the Royal United Service Institution, Whitehall, when a paper will be read on "Mechanical Flight," by Mr. Herbert Chatley, B.Sc. (Engineering) Lond.

COMMERCIAL MOTOR VEHICLES.

MR. SHRAPNELL SMITH read a paper to the members of the Royal A.C. on Thursday of last week on the subject of "Twelve Years' Progress in the Application of Commercial Motors." The paper was illustrated with tables showing a remarkable decrease in "lost mileage" in successive public competitions and the growth of the use of the business motor vehicle amongst brewers, carriers, municipal authorities, &c. Sir David Salomons, Bart., presided.

In the course of his paper Mr. Smith said there were, twelve years ago, no commercial motors in existence for use. The North of England Branch of the Self-Propelled Traffic Association was inaugurated in October, 1896, when Sir David Salomons, Bart., was unable to indicate a single motor vehicle for utility purposes. There had been several efforts to encourage the construction of self-propelled vehicles for industrial purposes, notably the competition announced by the proprietors of the *Engineer*, and a second under the auspices of the Royal Agricultural Society of England. The opportunity for wider employment of commercial motors was increased by reason of the less disadvantageous conditions of the Heavy Motor Car Order of 1904. Before that Order came into force the unladen weight of any motor-car might not legally exceed 2 tons 19 cwt. 27 lbs., whilst any development of public service vehicles was virtually prohibited by their falling within the speed limit category of five miles an hour. The accompanying table shows the improvement which has been testified to in various public trials that have been held, the last being that organised by the R.A.C. in the autumn of last year, which gave a splendid result of only 7.3 per cent. of lost mileage.

Summary of, and lost mileage in, certain public competitions:—

| Year. | Organising body. | Number of machines. | | Motive powers at "Finish." | | Maximum low car-ried, tons. | Maximum reloaded mileage per vehicle. | Per-centage of miles lost. |
|-------|------------------|---------------------|---------------|----------------------------|----------------------|-----------------------------|---------------------------------------|----------------------------|
| | | Started. | In at finish. | Steam pro-pelled. | Internal com-bustion | | | |
| 1897 | A.C.F. ... | 10 | 7 | 5 | 2 | 5.5 | 192 | 22.4 |
| 1898 | L.S.P.T.A. ... | 4 | 4 | 4 | — | 4.7 | 143 | 14.7 |
| 1901 | L.S.P.T.A. ... | 9 | 8 | 6 | 2 | 6.3 | 168 | 12.0 |
| 1905 | A.C.F. ... | 57 | 50 | 2 | 48 | 7.1 | 555 | 9.5 |
| 1907 | R.A.C. ... | 56 | 50 | 11 | 39 | 5.0 | 1,582 | 7.3 |

An analysis of 342 returns from owners of satisfied users of commercial motors was interesting, showing that in fifteen or sixteen leading trades the industrial vehicle is doing good service. Mention was also made of the development of motor-bus and motor-cab traffic in London, and of the fact that there are not less than sixty motor vehicles now under contract for the conveyance of the Post Office mails.

The undeniable progress of the last few years was measured by higher performance in relation to cost. The cost per vehicle-mile was uniformly less in each class for equal loads than it was even a couple of years ago, whilst lost earnings and disturbance of business generally were virtually disappearing factors in the problem. To-day the purchaser could, in many cases, obtain guarantees as to the maintenance, whether of india-rubber tyres or the whole of the mechanical parts; he could obtain written assurances from users who have been employing vehicles of the same make; he could obtain drivers who had had experience on the road—a qualification which is certainly necessary for men who have to go far afield, and more particularly for those who are in charge of steam wagons; he could obtain low and inclusive insurance rates, unless where exceptional risks are involved. Briefly, given ordinary care and supervision, he could take his choice in the following classifications, with the knowledge that his total outgoings per vehicle mile would not exceed the amounts indicated. One-ton van (petrol), 5d.; two-ton vehicle (petrol) 6½d.; three-ton lorry (petrol) 8d.; five-ton tractor (steam), 8½d.; five-ton wagon (steam), 9½d.; five-ton wagon (steam) with trailer, 1s. A discussion followed, in which the chairman, Messrs. H. G. Burford, J. S. Crichtley, G. Pullock and Portheim took part.

FROM the Motor House, 314-316 and 366-368, Euston Road, N.W. comes a special bargain list of cars which they have now on sale. The Motor House has also twenty new chassis of high grade and of 16-20-h.p. and 30-40-h.p., which are now being offered at special prices.

CASES AGAINST MOTORISTS.

"OH!"

Alexander C. Clarke, mining student, was summoned at the East Pen with (Cornwall) Police Court for having no rear light on a motor-car at 2.15 in the morning.

Defendant said the weather was very wet and windy, and he supposed the light was blown out on the way home.

A fine of 15s. and 6s. costs was inflicted.

Defendant: I thought 10s. was the maximum.

A Magistrate: £10.

Defendant: Oh!

POLICE EVIDENCE.

At the Bristol Police Court, Frank Broomfield, a chauffeur, was summoned for driving a taxi-cab at a dangerous rate. P.s. 2A said on Saturday evening, the 7th of last month, he saw the defendant driving a taxi-cab, No. 1340, at a furious rate in Lower Maudlin Street. Witness was subjected to a cross-examination by Mr. Inskip, who defended, and asked him by what he judged the speed of vehicles. "By my own common sense, sir," was the reply. Broomfield, in the witness-box, said he had perfect control of the vehicle, and estimated that he was riding at between twelve and fourteen miles an hour. Mr. Inskip, in addressing the Bench, commented on the conduct of the police-sergeant and an attending inspector. "Asking a man for his name and address is, one thing," said Mr. Inskip, "and going to him on the pretence of getting his name and address and questioning him for material for prosecution is another. I can't understand what authority the police have to question a man in this way. The thing is altogether inconsistent with my ideas of British justice—ideas which were instilled into me half a century back, and which I still hold to," continued Mr. Inskip, who asked the magistrates to give the case the benefit of the general principle, as he did not deem the offence to have been proved. Mr. Inskip also pointed out that the sergeant omitted to give in evidence some of the statements the defendant communicated to him.

The Chairman, in summing up, said they considered fourteen miles an hour was a dangerous rate for a motor-car to be proceeding in that locality, with its many crossings. They should inflict a fine of 20s. and costs. Later, the Chairman said: "We desire to express our concurrence with what Mr. Inskip says, that it is not only the duty, but it ought to be the pleasure, of all constables to give every detail in evidence, more especially any fact or word that may be in favour of a defendant. We hope all constables will bear this in mind."

A MOTORIST DECIDES TO GIVE UP DRIVING.

At Milverton Police Court, Lionel Lakin, of The Cliffe, Warwick, was summoned for driving a motor at a speed dangerous to the public at Radford on the 21st ult. P.s. Butcher said that the car covered a measured quarter of a mile at a speed of over 23½ miles per hour. There were several children playing about the road, which had a dangerous bend in it, and there was other traffic on the road. The horn was sounded. Addressing the Bench, defendant said that he had driven over this stretch of road at least 800 times, and he prided himself on his carefulness. Owing to the attentions of the police he had now given up driving his own car. He was fined £5 and costs.

BRIEF MENTION.

Convictions of motorists have, within the last few days, taken place at the following courts:—Wimbleton (7), Epsom (15), and another 9 cases on Monday, Shoreham (7), Horsham (8), Kingston, (4) Woking, Colchester (5), Stony Stratford (2), Longton (6).

DISMISSAL.

At King's Heath Police Court, Joseph Golder, employed by Mr. C. T. Menke, the German Consul for Birmingham, was summoned for driving a motor-car across the Alcester Road at a speed dangerous to the public on November 8th. P.c. Payne said that defendant crossed from St. Mary's Road, Moseley, towards Salisbury Road on that day at a speed of fifteen miles an hour. The car dashed into a cyclist, knocking him down and smashing the machine. The cyclist, James W. Bache, said that he was passing a funeral procession, and was justified by the rules of the road in taking the centre, where he was knocked down. Mr. Baker for the defence contended that if the cyclist had been on his right side the accident would not have happened. Three passengers on the car spoke to the reasonable pace at which the car was going, and said the cyclist apparently lost his head and wobbled into the car. The Bench came to the conclusion that the driver was not at fault, and dismissed the case.

IMPRISONMENT.

On Monday, Max Dalloz was indicted at the Guildford Assizes for the manslaughter of a man at Perry Hill, Guildford, on September 10th. The circumstances have already been reported. The defendant was chauffeur to Lord Newborough, and after counsel for the prosecution had opened the case was adjourned till Tuesday, when Dalloz was sentenced to twelve months' imprisonment and recommended for deportation at the end of the term.

AN instructive novelty issued by the Daimler Company at Olympia clearly points out and describes by means of diagrams, &c., the different points of interest in the new Daimler engine. It saves much study, and presents the motor in quite a tabloid form. A copy will be sent, post free, to any applicant, either to the various depots of the company, or direct to the works at Coventry.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE SOCIÉTÉ DES ANCIENS ÉTABLISSEMENTS CHENARD ET WALCKER (AGENCE D'ANGLETERRE) (LTD.) has been registered with a capital of £2,000, in £1 shares.

AERO-MOTORS (LTD.) have been registered with a capital of £100 in £1 shares.

LANCASHIRE MOTOR AND ENGINEERING COMPANY (LTD.)—Registered with a capital of £1,500 in £1 shares. The registered office is at Victoria Hotel Yard, Fishergate, Preston.

MESSRS. W. L. STEWART AND CO., LTD., has been registered with offices at 166-170, Shaftesbury Avenue, London, with a capital of £10,000.

FLORENTIA MOTORS (London).—Registered with a capital of £20,000 in £1 shares. To acquire and turn to account the rights of W. C. Jones in patent No. 12,460 for improvements relating to vehicle springs. Private company. 31, Piccadilly Mansions, London, W. (100,379.)

MIDLAND COUNTIES MOTOR GARAGE COMPANY.—£24,000 (£1) (14,100 preference). Object indicated in the title. Private company. (100,397.)

ALLDAYS AND ONIONS.—The annual meeting of Alldays and Onions Pneumatic Engineering Company, Ltd., was held at the Works, Small Heath, Birmingham, on the 26th ult. Mr. E. Tailby, who presided, said that although the net profit for the past year (£13,540) was somewhat less than for the preceding twelve months, the directors were satisfied with the result when they remembered the general trade conditions. In the motor trade they had experienced competition, but had come through successfully with an increased turnover, and profits had been kept up. They had added a profitable motor department to the business at considerable cost without having called up any further capital, but the directors thought the time had come when the balance of the ordinary share capital should be issued. This represented 3,670 shares of £5 each, on which they proposed to call up £3 per share, making them equal to the present shares. They recommended the usual 5 per cent. dividend plus a bonus of 5 per cent., the same as last year, and they carried forward £16,107. Mr. W. Allday seconded the adoption of the report, which was carried.

ARGYLL MOTORS, LTD.—A scheme for the reconstruction of this company is contained in a memorandum prepared by Mr. Thomas Jackson, C.A., and Mr. John M. MacLeod, C.A. The assets, including premises, tools, plant, fen duties, &c., have been valued at £322,523, against a book value of £710,545. The total amount due on debentures to date of liquidation is £260,712, and the valuation of the securities belonging to the debenture-holders amounts, on the basis of a going concern, to £232,000, and, on the basis of a forced sale, to £96,230. The valuation of the free assets belonging to the unsecured creditors amounts, on the basis of a going concern, to £90,503, and on the basis of a forced sale to £34,550. The creditors' claims, including £30,380 12s. from Argylls London, Ltd., in liquidation, amount to £360,970 1s. 5d. According to the scheme of reconstruction the debenture holders' claim of £260,712 is to be satisfied by the issue of new debenture stock amounting in all to £144,000. The authorised amount of the new debenture is due to be £200,000; the company is to be at liberty to issue a further amount of £16,000 without additional security, but the balance of £40,000 can only be issued in return for secured assets. Debenture holders are not to have the right to foreclose during the first four years, and the interest is to be non-cumulative for that period. The trade and cash creditors are to be given £75,000 of 5 per cent. income debenture, non-cumulative; creditors under £50 to be paid cash at the rate of 4s. per pound; the share that such creditors would have had in the total amount of income debenture bonds to be distributed to be deducted from the £75,000, leaving the balance *pro rata* among the remaining creditors. New ordinary shares to be created to the extent of 419,595 shares of 10s. each, credited at 6s. 4d. paid with a liability of 3s. 8d. per share, as follows:—30,000 preference shares of £5 each, and 38,264 B preference shares of £1 each, to be replaced by 186,264 shares of 10s. (6s. 4d. paid); 350,000 ordinary shares to be replaced by 233,332 shares of 10s. each (6s. 4d. paid), that is, two shares in respect of every three old shares. The new company, it is declared, would start with assets valued at less than one-half of what they stand at in the books. Including the cash from the proposed new issue and the stock, stores, and cash at present on hand, the company, it is stated, should have at least £100,000 of working capital free of old debts. Mr. Faithfull Begg and Mr. D. Johnstone Smith, trustees for the debenture holders, have issued a circular in which they state that the scheme is one which the debenture holders may fairly approve.

THE DAIMLER COMPANY.—The annual meeting of the Daimler Motor Company (1904) Ltd., was held at the works on Tuesday, with Mr. E. Manville in the chair. He regretted that the directors could not recommend the payment of a dividend on the ordinary shares. The prospects for the new year's trading were excellent and they hoped would prove some consolation. With reference to the stock-in-trade this amounted to £289,657. Since the balance-sheet had been made up, £8,000 worth of cars had been sold at a price above which they were taken into the balance-sheet, so that the stock of finished cars now stood at £29,052. Soon after the beginning of the trading last season it was evident that many high-priced cars were being offered by the trade at prices that made it difficult for the Daimler Company to dispose of their own wares at their proper prices. It was evident to himself and

colleagues that the production would have to be cut down to the lowest limits. Their estimates at the close of the first half-year indicated that up to that date the trading had resulted in some measure of profit, and had they not taken into consideration the needs of the future they might have ended the year with a profit balance by materially reducing the whole organisation of the works. With regard to the future he held out prospects of the rosiest character and went on to deal with the history of the introduction of the new engine, much of which has already appeared in our columns. The prospect of the general acceptance of their new car by the public was, continued the chairman, good, and they regarded the introduction of the engine as having an equally great importance from the point of view of its use for commercial purposes. Experimental work had already resulted in advancement in two directions. Their omnibus had been extensively tried in Paris, and they were in negotiations for their first orders from that centre. During the past year they had constructed a number of Renard trains, and recently the Argentine Government had authorised the expenditure of £30,000 in the purchase of such vehicles. They were working in conjunction with agricultural engineers for the introduction of a type of motor for agricultural purposes. The profits of the hiring department had not been inconsiderable, and if the rate at which they had been receiving orders continued during the season they might look for a prosperous year.

Three or four shareholders in the company having made remarks on the chairman's speech, Mr. Manville replied, and the motion for the adoption of the report and another for the payment of the preference dividend were carried unanimously.

The retiring directors, who were re-nominated, Messrs. Barwick and Martin, were re-elected, and the chairman announced that the Board

One of the Single-Deck Public Service Vehicles lately turned out by the Hispano Suiza Company, of Barcelona.

The vehicle is fitted with a 25-30-h.p. four-cylinder engine and has accommodation for about fourteen passengers.

would consider the question as to whether any change should be made in the place of meeting.

The proceedings then terminated.

"POLICE CONTROLS."

THE police are frequently trapping motorists on the Bury road, Exning, near Newmarket.

THE police are timing motorists almost daily at Southwick, and several drivers recently caught in that trap have appeared at the Shoreham Petty Sessions with the usual result.

THE trap in the Morden road, at Wimbledon, is in almost daily operation and the police are also exceedingly watchful of motorists passing Barnes Common.

THE police "control" at Ewell has been in active operation during the last few days.

THE police have established a motor trap in the village of Trentham, Staffordshire. This is over a distance of 600 yards, extending from Ash Green to the N.S. Hunt stables on the Newcastle road, including a very awkward turn on the Longton road. Twenty-five miles an hour is the speed allowed by the police; those who travel beyond that rate are summoned.

MOTORISTS are now being timed daily over measured furlongs at Hornham and Ifield—in both of which places are ten mile an hour speed limits.

THE London road, Colchester, is being made quite a hotbed of traps by the local police.

THE police have a timed furlong on the Victoria Embankment, London.

FORTHCOMING EVENTS.

DECEMBER.

- 10th (Th.).—Annual Dinner of the Aero Club of the United Kingdom at the Hotel Ritz, London.
 10th.—Ladies' A.C. lecture by Mr. C. Y. Knight on "The Valveless Engine."
 11th.—Scottish A.C. Conference with Road Surveyors' Association of Scotland.
 13th (Sun.).—Closing day of the Paris Salon.
 18th (F.).—Society of Road Traction Engineers' Smoking Concert at the Holborn Restaurant, London. The primary object of the concert is to afford an opportunity for a pleasant reunion of those who took part in the Commercial Vehicle Trials last year.
 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1904.

- 1st (F.).—Anniversary of the Motor Car Act, 1903, coming into operation.
 7th (Th.).—Annual Dinner of the Yorkshire A.C. at Leeds.
 8th (F.).—Nottinghamshire A.C.'s Annual Dinner.
 14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
 14th-25th.—Brussels Motor Show.
 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
 26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
 Motor-Car Show at Barcelona.

LIGHTING-UP TIMES—LONDON.

During the whole of the week beginning with to-day (Saturday) the lighting up time will be 4.50.

To find the approximate lighting-up time for Birmingham 4 minutes should be added to the above time, and 1 for Manchester. For Glasgow 3 minutes should be subtracted, and a deduction of 6 minutes from the above times should be made for York.

ROAD REPORTS.

LANCASHIRE.—We understand that the Lancashire County Council is about to make trial of a new system of road making on a length of main road between Accrington and Haslingden. This is known as the Dourax system, and the road will be made with small granite setts of 3½ to 3¾ inches laid in intersecting circles.

HORSHAM-WORTHING.—The Sussex County A.C. has been instrumental in securing an improvement on the Findon section of the Horsham-Worthing road. For some distance this section was curtailed on one side by a large ditch, but it has now been piped and filled in by the West Sussex County Surveyor.

COUNTY DUBLIN.—The County Dublin County Council has adopted a motion to the effect that a speed limit of ten miles an hour would not afford the police as much protection as they would obtain under Section 1 of the Motor Car Act, if the provisions of that section were effectively carried out by the police.

PADDINGTON.—Regarding complaints from the Paddington Borough Council and inhabitants as to motor-omnibus traffic in Kilburn Lane—a narrow thoroughfare—the L.C.C. have informed the Borough Council that the Public Control Committee of the former body "are fully considering the whole question of the better regulation of heavy motor-car and locomotive traffic in the streets; that the County Council's powers are very limited; and that fresh legislation will be needed, which, it is hoped, the Government will introduce at the earliest possible date."

LINDFIELD.—The Lindfield Parish Council has adopted the suggestion of its General Purposes Committee to make application for a ten mile speed limit for motor-cars passing through the village.

WEST SUSSEX.—At the meeting of the West Sussex County Council the report of the Finance Committee referred to an expenditure of £2,885 on the work of tar-painting on the county main roads. In the course of the discussion the Rev. E. D. L. Harvey said that in consequence of the long-distance timing on the main Brighton road a great deal more motor traffic was driven on to the road through Horsham and Worthing to Brighton, with the result that the surface was much cut up; and unless it had been treated with tar the Council would have had to face a very serious expenditure on its repair.

HIGH WYCOMBE.—On Monday a L.G.B. enquiry was held into the application of the High Wycombe Corporation that the speed of motor vehicles passing through the borough should be limited to ten miles per hour. Objection was raised to the proposed restriction, and Mr. Rees Jeffreys urged that the road was one of the most important trunk roads in England, not only serving London and Oxford, but being connected with the main road to South Wales. Mr. Willis, the Inspector, will report upon the matter in due course.

THE RULE OF THE ROAD.

A CASE was heard before the Chichester County Magistrates on Saturday which shows how necessary it is to strictly observe the rule of the road. The offender was the driver of a van who, according to the evidence, drove round a corner on his wrong side at a fast pace, and, meeting a lady driving in a cart, collided with her, with the result that the cart was turned over and she was thrown out. The Magistrates took a serious view of the case, and mulcted the offending driver in a fine of forty shillings and costs.

AUTOMOBILE ACCIDENT.

THE driver of a motor-car belonging to Mr. Bainbridge, whilst proceeding along the Northallerton-Boroughbridge road failed in approaching a railway crossing to notice that the gates were shut. The car crashed through the first gate, partially wrecking it, and was brought to a standstill, by the force of the impact, on the metals. Fortunately no train was approaching at the time. The car suffered a little damage.

BUSINESS NEWS.

MESSRS. R. GORNALL AND SONS, of Pilling, near Garstang, Lancashire, have facilities for the charging of accumulators and the repair of motor-cars.

RENOID chains were fitted to over 50 per cent. of the chain-driven cars at the recent Olympia Show.

MR. SPONG, finding his present establishment too small to cope with his increasing business in motor tyres, has taken premises at 193, Shaftesbury Avenue, London, W.C., where he hopes to continue to serve the motor trade as well as private owners.

THE Motor Accessories Company, of 55, Great Marlborough Street, London, W.C., exhibited at Olympia the Muirhead high tension magneto—an ingenious accessory that can be dismantled piece by piece without removing it from the engine.

THE British Chamber of Commerce in Paris is calling the attention of merchants and manufacturers to the changes which have been proposed by the French Parliamentary Customs Commission, and which may, it is thought, shortly be laid before Parliament for approval and application. Among other items it is proposed to increase the duty on motor-car pneumatic tyres from £2 16s. to £3 16s. per 100 kilos.

MESSRS. PERCY LAMBERT AND CO. have long been known in the West End of London in connection with the sale of motor-cars of reliable running; Messrs. T. Worger and Son have been established in the same district since 1842 as coach builders, and, latterly, as motor-body builders. These firms have now amalgamated as Messrs. Lambert and Worger and will continue the joint businesses in splendid premises in Palace Street, Victoria Street, Westminster, S.W. We understand that, in addition to undertaking the sale of motor-cars of all types, they have obtained an agency for the sale of the Austin cars. Motor-body building will also be a prominent feature in the activities of the new combination.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

[No. 510]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE Expert and Technical Committee of the R.A.C. is giving serious attention to the regulations for the forthcoming trial of headlights. In this the classification will be based on the candle-power of the naked flame, the categories which have been provisionally accepted being five candle-power and less, over five and under ten, ten and under twenty, twenty and over. If satisfactory arrangements can be made, the Trial will be held at the Crystal Palace, and the Local Government Board

will probably be represented at the tests. Already the latter has been in communication with the Committee on the subject, expressing the view that the glare of high power lights on motor-cars should be abated, and regarding with approval any efforts to encourage attempts to minimise its effect on passing traffic.

The Progress of the Flying Machine.

AVIATORS in France cannot complain of want of encouragement. Scarcely a day passes without the creation of some new prize or the announcement of a generous donation for the encouragement of the aerial science. Great cities and health resorts vie with one another in tempting offers to furnish the necessary ground for experiments, and the undertaking to construct free of all cost the sheds required by the aviators for their machines. Some of them, such as Monaco, Nice, Marseilles, Cannes, &c., have also created handsome prizes to induce the aviators to visit them. They are not like so many poor inventors whose genius has only been recognised long after they took their departure for another world. And the material encouragement is rightly not considered sufficient. At a banquet held in Paris on Saturday last, in honour of the French aviators, M. Barthou, the French Minister of Public Works, announced that at a Cabinet Council the Government had unanimously agreed to confer the cross of the legion of honour on several of the pioneers in the conquest of the air, as well as on many of the delegates who recently attended the International Road Congress. If the aviators merit the coveted reward for their perseverance and courage in opening up the ethereal realm to mankind, the leading members of the Road Congress, though working in what may be described as a less brilliant career, nevertheless deserve the recognition of their services, which will probably be of more immediate benefit to the ordinary mortal who will still for a long time have to crawl along the terrestrial roads than the inventions of the men engaged in creating aerial highways.

M.P.'s Again.

In the House of Commons, on Monday, thirty-five members of Parliament, many of whom are owners of motor-cars, waited upon the President of the Local Government Board with a request that his Department should issue a general notice to the effect that when a local authority made application for the speed limit not exceeding ten miles an hour it should be granted provisionally until good reason was shown to the contrary. Mr. Burns expressed his sympathy with the object in view and promised to look carefully into the Motor Car Act in order to discover what his powers really were. We should have thought that, after the

catechising he has lately undergone at the hands of inquisitive Parliamentarians, the President was sufficiently *au fait* with the Act to have been able to assure his questioners that they were asking him to drive the proverbial carriage and pair through an Act concerned with motor-cars. For although the Section 87 of the Local Government Act, 1888, which relates to local inquiries, applies in this case, the procedure adopted since the Motor Car Act of 1903 came into operation has been to hold the inquiry before the L.G.B. decided. The Local Government Board has acted on the line that such inquiries have been necessary—a course that is clearly right in view of the many applications that have been declined. Moreover, the fact that inquiries were to be held has prevented many frivolous applications being made. The M.P.'s gave no new arguments nor advanced no evidence that the present procedure has operated badly; while substantial proof can be adduced to show that the complaints against motorists are decreasing, despite the greater number of cars on the road. Some proof of this was given at the dinner of the Cheshire Automobile Club, on Saturday, when Col. Hamersley, the Chief Constable of the county, declared that out of 900 cars which he had had timed only twelve were proceeding at a pace which warranted a reprimand. Such facts as those should be considered by the Local Government Board, as well as the suggestions of M.P.'s who are worried by constituents of local political importance.

"Et tu, Brute!"

At the same time we must express surprise that motorists who have practical knowledge of the matters in question should allow themselves to be the spokesmen of petty and prejudiced opinions. As M.P.'s they should educate their constituents, demonstrating, if need be, the safety and the value of the automobile—as the central motoring organisation added to the knowledge of M.P.'s in the early days. Fortunately the President of the L.G.B. is an engineer with a practical mind, and he must realise the importance of fostering rather than killing an industry which is likely to find employment for many people at a time when unemployment is casting a dark shadow over the national prosperity. Have those who formed the deputation fully realised the significance of the step they were taking; for the adoption of their suggestion would tend to set back instead of advance this important branch of the engineering and carriage-building trades? It would appear that the motoring movement is to be injured in the house of friends.

The Importance of the Local Clubs.

THE decision of the Royal Automobile Club to accept affiliation only from those organisations which are exclusively supporting the Piccadilly Institution has given rise to some interesting variations in local views. As announced in our Club News, the Derby Club has decided not to associate on the present exclusive terms, and now a postal vote of members of the Berkshire A.C. has shown that of 100 members who voted sixteen were for association with the R.A.C., three for affiliation with the M.U., and eighty-one for independence. The club will, for the present, therefore not become attached to either organisation, a policy which will doubtless be much discussed by other provincial organisations. Following this decision at a general meeting of the Berkshire Club it was decided to reduce its annual subscription to one guinea, so as to en-

large its circle of influence as widely as possible. Some idea of the importance of these county organisations may be gleaned from the fact that this club alone has in hand funds well in excess of £500. As we went to press we learned that the R.A.C. has considered the resolution adopted at the recent conference in the Midlands and has decided not to depart from its previous decisions on the question of joint affiliation.

Petrol Dangers.

WE have recently referred to the interest which the Home Office has taken in the extinction of petrol fires as well as in the general question of safety to those concerned with the conveyance and storage of the spirit. Private enterprise is also seconding their efforts, and under the auspices of the British Fire Prevention Committee a series of twenty-four tests were undertaken a few days ago at the Regent's Park Testing Station of the committee. Sir Henry Cunyngame, K.C.B., was present for the Home Office, and officials from many of the leading Government Departments were also present to watch the tests held under the direction of Mr. Percy Collins. We understand that an official report of the proceedings will shortly be issued.

Touring in Holland. The General Post Office, Amsterdam.

Police Warning.

THE Head Constable of Liverpool has issued an official notice suggesting that the speed of motor vehicles within the city is increasing to a point which is incompatible with public safety. Up to the present the necessity for prosecution has not arisen very frequently, but, unless increased moderation of speed occurs, he promises to give those who exceed a reasonable rate a salutary warning in the local police court. Several streets and roads are scheduled as thoroughfares where the speed attained is apt to be too great, and attention is called to several busy crossings where dangers exist to pedestrians and others using the highway.

Army Mobilisation.

AN excellent demonstration of the value of the automobile in times of war was given on Sunday in Essex, when a surprise test of the speed at which troops can be mobilised was carried out, the Chelmsford regiment (the 5th Essex Territorials) being selected for the experiment. The immediate object was also to gauge the utility of motor-buses in connection with flying columns. At 9.15 a.m. the alarm was sounded and within fifteen minutes the first movement was made, the whole of the contingent being away by ten o'clock. Two steam motor-buses and a motor-van were supplied by Mr. Thomas Clarkson, whose head

quarters are in the town. The two 'buses each carried forty men and the third vehicle sixteen, while twenty-four cyclists acted as scouts. By nine minutes past eleven o'clock the whole contingent arrived at Latchington, fourteen miles away, in remarkably good time, having regard to the condition of the roads and to the ascending route, which included Danbury. The return was made in about the same time, and the test provided further proof of the value of the motor vehicle in mobilisation work.

Towards Common Sense.

ALTHOUGH one or two fogs do not make a winter, we regard a few cases where motoring has recently been considered in a common-sense way as indicative of a broader spirit which is gradually coming over some of our local authorities, and of a wider outlook now being taken by some magistrates. At the East Grinstead Petty Sessions, the counsel for a motorist, who was not served with a summons until ten days after the occurrence of the alleged offence, expressed the view that the police were really preventing anything like adequate reply being made to the charge. The Bench, however, fined the defendant. They were then good enough to express the opinion that the police, in future cases, should give notice to those who might be regarded as offenders as speedily as possible after the event. This, of course, does not suggest that the police will adopt the hint, but that it should have been made in a southern police court is in itself somewhat significant. In connection with this it is also noticeable that when the recommendation for the General Purposes Committee to apply for an Order limiting the speed of motor-cars in the borough to ten miles an hour was before the Town Council of Boston (Lincolnshire) a few nights ago an amendment rejecting the proposal was adopted by the Council. And now comes the report that the Essex authorities have rejected a proposal to supply the police of the county with stop-watches.

Petrol in Sewers.

AT the request of the L.C.C. we have on several occasions urged those responsible for the management of garages to secure that no petrol is allowed to pass away into the sewers. That the warning is necessary has received new demonstration at Marylebone Borough Council meeting, when Alderman Anglim stated that an employee of that authority had nearly lost his life in one of the sewers. The man, said Mr. Anglim, was at work when a large quantity of petrol, which had been poured down the drain by someone, exploded, with the result that the man's clothing caught alight and he was a mass of flame. With great difficulty he was extricated from the sewer and was now in the hospital terribly burned about the body.

Pressure in Tyres.

MAKERS have been liberal in their advice with regard to the way in which to secure the best from tyres, but private users have been less inclined to rush into print on the subject. Recognising the importance of the subject, Mr. G. Gillmore, the Hon. Treasurer of the Manx A.C., recently sought information thereon from several practical motorists on the island, and has come to a very definite conclusion which will be of service as well as of interest to those on the mainland. He has always held that tyres should not be pumped too hard, particularly in hot weather, the main reason for this being that when a car is going along at a good pace, and one of the wheels suddenly drops into a hollow or runs on to a stone, almost the whole weight of the car is thrown on to that tyre. This must put a very great extra pressure on to the pressure already in the tyre. But if the tyre is not pumped too hard, the shock would, according to Mr. Gillmore's view, not be so great, and far less harmful to the car and engine. Mr. Caparn, however, gives his opinion that back tyres should be pumped up to 80 lbs. and front tyres to 70 lbs., winter and summer. He also advises a separate pressure gauge to be used, as, according to his experience, those usually fitted on pumps are not reliable. The chauffeur to

Mr. Earle Hunt states that he thinks weather has a good deal to do with tyres, and keeps the tyres at 65 lbs. pressure on rear wheels and 55 lbs. front in summer, whilst in winter the rear tyres are 75 lbs. Possibly other readers of the *M.C.J.* have observed the effect of the summer or winter season on tyres.

The Swan Song of the Horse.

MR. BASIL TOZER is of opinion that "to-day it seems likely, indeed, almost certain, that the horse's influence upon the world's progress has actually come to an end." Having arrived at such a conclusion he has written an interesting volume of nearly 300 pages entitled "The Horse in History," which has been published by Messrs. Methuen and Co. Before he reaches the note of pessimism to which we have already referred, Mr. Tozer says much as to the part played by the equine from the very earliest times. We are reminded that Professor Owen believed that the Egyptians of the Eighteenth Dynasty

naturally motorial, we have read Mr. Tozer's book with pleasure. His conclusions are true in the main, but we cannot wholly accept his prophecy as to the decadence of the horse within the next thirty years. Of course motoring is making rapid strides—if the term will be allowed by the author—but the Swan Song of the Gee Gee need not yet be written.

The Chauffeur.

A MEMBER of the Oxford and Cambridge Club sends what he regards as the real history of the name of the "chauffeur." Originally, according to his version, the chauffeurs were brigands who, in 1797, infested the department of Eure-et-Loir and inhabited caves and disused quarries around Chartres, sallying forth at night masked, forcing the inmates of surrounding houses and chateaux to hand over their valuables. On their refusal to do so, or divulge where their treasures were hidden, they were dragged to a fierce fire and their feet scorched

The Opening Meet of the Earl Fitzwilliam Hunt at Clumber.—Earl Fitzwilliam, the Master, mounting at Clumber House after arriving by motor-car.

were the first to seriously turn their attention to the employment of horses for useful purposes, but it was not until the Neolithic Age that these animals were domesticated. Proof of this has been found in some remains of horses discovered at Walthamstow, in Essex. Chariots seem to have been the original means of employment, and it was not until 1000 B.C. that anyone, except the Libyans, rode on horseback. In the fourth century the Romans saddled their horses and nearly 200 years later the shoeing business commenced. Many distinguished quadrupeds find mention in Mr. Tozer's book, and credit is given to Sir Robert Carey for riding on horseback between London and Edinburgh in sixty hours, the reason for such celerity being his desire to acquaint James the 1st of the death of Queen Elizabeth. Queen Bess must have been a source of considerable trouble to the people of the localities in which she stayed from time to time, for it is said that when she travelled 2,400 horses had to be provided to drag the carts containing her baggage and paraphernalia. This is all the more credible when we consider the roads. Although our interests are

or roasted till they had satisfied the cupidity of the brigands. Hence "chauffeurs." One hundred and ten were captured and nearly all executed and the quarries walled up. Such a derivation is almost as interesting to the modern motorist as was Darwin's Descent of Man to our grandfathers.

Motor Cases at Horsham.

THE advent of motor-cars has added very considerably to the magisterial duties, and whereas sittings of the Court were formerly fairly brief as a rule, nowadays they are correspondingly extended. Horsham's experience of late has meant a weekly addition of some two hours to the Court sittings. Apparently all southern benches do not view motor offences in the same light. At Horsham the penalties are usually very moderate, and motorists have learned by experience that to contest cases does not pay, for the usual effect of longer hearings is larger penalties.

GOSSIP FROM PARIS.

French Manufacturers and the Grand Prix Race.

Not long ago M. Clemenceau declared in the French Chamber "Nous sommes en plein dans l'incohérence." If that was then true of the Government and its majority, it is equally true at the present moment of the Automobile Club and its sporting and other committees. What could be more incoherent and contradictory than the conduct of the chiefs of the leading automobile firms who are at the head of the A.C.F. In their capacity of delegates of the A.C.F., they met the members of the International Association of Automobile Clubs on November 30th, and, as stated in the *M.C.J.* last week, settled the much-vexed question of the detachable rims and wheels. The following day the same representatives of the leading automobile firms attended the "Congrès du Calendrier" and fixed the dates of the Grand Prix and of the Coupe des Voiturettes for July 1st, 2nd, and 3rd next. Well, after all that, one might imagine there could be no question of not holding the great international competition, but there is! No sooner were the arrangements for holding it complete than the gentlemen who had most actively participated in the preparations announced publicly they would have nothing to do with it, and sent an authorised agent round to all the other important French automobile manu-

A State Public Motor Service in Bavaria.—A Snapshot at Konigssee.

facturers and to the representatives of the foreign makers demanding their adhesion to the agreement, by which they pledged themselves not to participate in any race in France during the coming year. And, discounting their success in suppressing the Grand Prix of 1909 by a general boycott, they intimated privately to the local committee of the Anjou Circuit that it had better suspend its preparations. If this conduct is not incoherent and contradictory I do not know what else to call it. Supposing these manoeuvres are successful and the English, German, Italian, and other foreign makers who were invited so pressingly by the French to participate in the Grand Prix consent to join the French in boycotting the race, it is not clear that they will gain any advantage from it. On the contrary, if they wish to participate in the great automobile competitions organised in their respective countries, they will have to make racing machines and spend almost as much money as if they took part in the Grand Prix. The only saving for them would be the entrance fee and the cost of sending their cars and men to France. That would, of course, be an economy, but they would lose the great advertisement a victory would give them. If a firm makes racing cars, it is because it hopes to get a good advertisement by at least figuring well in the contests. Then, again, by not participating in the Grand Prix the foreign manufacturers would not in any way secure the abstention of the French in their international competitions. Panhard, Renault, Clement-Bayard, &c., would be perfectly free to send racing cars to England,

Germany, Italy, or anywhere else out of France. Moreover, what is to prevent the French firms that may have signed the engagement not to race in France next year from constructing cars for private individuals, who might enter them for all the races they might think fit? This trick has been played before and it might be repeated.

Will there be a Paris Salon in 1909?

Suppressions are evidently the order of the day. The same leading automobile manufacturers who want to cancel the Grand Prix also wish to suppress the Salon of 1909. They say an automobile show once every two years is quite enough for them and should be enough for everybody else. The document presented for signature to all the exhibitors in the present Salon would constitute an engagement not to exhibit in any automobile show in France next year. For the firms which turn out a minimum of 100 cars per annum the penalty for breaking the contract would be £2,000, and for the makers whose annual output is less than 100 cars it would be £1,000. The alleged reasons for the proposed transformation of the annual Salon into a biennial show are the cost of its organisation and of participation in it, and also the impossibility of having well studied and thoroughly perfected novelties to exhibit every twelve months. It is said that of the leading French automobile manufacturers De Dion is the only one who has till now refused to sign the agreement. But, as the engagement is only to become binding if the signatures affixed to it represent a total annual output of 10,000 cars, it is still uncertain whether the promoters of the movement will get their way.

Parisian Taxi-cab Charges.

Since the opening of the Salon I have almost every day heard complaints against the taxi-cab drivers. "What rogues they are!" said an Englishman. And an American replied, "I guess we would not stand that in New York." Each of these gentlemen had three days' running, taking a taxi-cab from his hotel to the Grand Palais, and on each occasion had to pay a different fare. It is possible they may both have been cheated, but it is much more likely they were the victims of the defective tariff system existing in Paris. Till now the municipal authorities have found it impossible to establish a uniform tariff because some of the cabs are of high power, consuming a large quantity of essence, while others, like the new De Dion vehicles, require so little that they can ply at the fare charged by the one-horse cabs. The municipality therefore fixed a maximum tariff and left the owners of the taxi-cabs free to charge what they like so long as they do not exceed that maximum. Consequently it is not astonishing that my English friend should on one occasion, when he hailed a red cab, have paid to go from his hotel to the Salon only 1 fr. 95 c., on another, when he took a green vehicle, 2 fr. 50 c., and on a third day, when the hall porter of his hotel put him into a blue cab, so much as 3 fr. 15 c. It is the little yellow cabs that charge the same fare as the one horse cabs, but at present there are not many on the stands.

MARNEY.

WHILST the Board of Trade Returns show a decrease of £52,912 in the value of the motor-cars exported from this country for the first eleven months of 1908, the imports have declined £654,956. The imports of petrol, however, show an advance of more than 8,000,000 gallons.

AT the Court of Bankruptcy, a day or two ago, a motorist was examined. He told how, since obtaining his majority in 1898, he had run through nearly a quarter of a million of money. Included in his list was an estimate of £58,000 in connection with motor-cars.

AN inquiry with regard to the regulation of motor traffic in co. Kildare during the Punchestown races has been held at Naas by the L.G.B. inspector. No opposition was raised to the proposal that cars proceeding to the races on all narrow roads within two miles of the course should not be allowed to travel more than six miles per hour, that motor-buses be prohibited from plying for hire, and that the military authorities be asked to send their heavy four-wheeled vans to the course at least two hours before the first race.

THE PARIS SALON.

[BY OUR SPECIAL REPRESENTATIVE.]

(Concluded from page 870.)

JUDGING from the attendance during the last week the Paris Salon has lost none of its popularity. Each day the well-known building has been crowded with people, and although at the beginning of the show relatively few English visitors were to be seen, a large number of those interested in the British trade put in an appearance last week-end. Following the usual practice, the organisers of the exhibition have allocated all the central spaces of the Grand Nef to French firms, while the cars of foreign builders are relegated to stands at the sides. The Italian automobile industry, notwithstanding, is very well represented; the exhibitors include Fiat, Itala, Bianchi, S.P.A., Rapid, Isotta-Fraschini, Züst, Lancia, San Giorgio, and a new-comer, Messrs. De Vecchi and Co., of Milan. From Switzerland comes the Piccard-Pietet, the Martini, and Saurer. Belgium

each secures a full blast of air for cooling purposes. The mixture is supplied from a single Zenith carburettor. The engine is stated to develop 24-b.h.p.; its weight is given at 110 lbs. complete, or approximately 4½ lb. per b.h.p. Another interesting engine is that shown by M. J. Ambroise Farcot, Paris. It comprises eight air-cooled cylinders set to form a circle round the crank shaft, each set of four cylinders working on to a separate crank pin. A special feature of the design is seen in the single valve for both inlet and exhaust. The engine is stated to develop 75-h.p. and to weigh complete only 242 lbs. Of the ordinary type of petrol engines for motor-car use, the Aster, Mutel, Ballot, Buchet, Farcot and Sultan may be mentioned.

Although they have not yet so far met with any noteworthy adoption there are still many engine-starting devices to be seen. Messrs. Renault Freres fit one to some of their cars, while M. A. Saurer, of Arbon, Switzerland, still keeps his arrangement well to the front. Another device on somewhat similar lines is the Malivert and Bousquet. The Zed starter of Messrs. Lemale and Co. consists of a spring device mounted on the forward end of

Fig. 8.—The Unic 16-h.p. Double Phaeton.

is represented by Nagant, Germain, F. N., Minerva, and Piedboeuf (Imperia). The German exhibitors include Mercedes, Benz, and the Berliner Motor-Wagen Fabrik. America has only two exhibitors (the Buick and Ford), Austria one (the Reichenberger Automobil Fabrik), while, as mentioned last week, the only British exhibitor of cars is the Wolseley Company. In our last issue we had only space to briefly deal with the general tendencies of motor construction as shown by the exhibits, this week we refer to some of the more interesting vehicles and accessories that are to be seen.

The Peugeot Company are turning out eight models for the 1909 season, ranging from a 9-h.p. single-cylinder vehicle to a 60-h.p. six-cylinder car. A notable feature of the live axle machines is the arrangement of the back axle casing, which is provided with extension piece from each side of the differential cover to the rear end of the cardan shaft sleeve.

In addition to the motors for aeronautical engines mentioned in our last issue, M. Giraud Ainé, the maker of the Buchet engines, shows one built to the designs of M. Korwin. It comprises six air-cooled cylinders arranged in two rows in such a way that

the engine crank shaft in place of the usual starting handle. The spring is wound up by the engine itself and when fully wound is automatically cut out. To start the engine it is only necessary to move a lever on the dashboard, which releases the spring and gives the necessary impetus to the crank shaft to set the engine in operation. A somewhat novel device is seen in the Cablo-Lanceur of M. Henri Toraille; in this a small compressor driven off the engine forces air under pressure into a reservoir connected by a pipe to a special chamber in which is a piston connected to a cable. The latter is wound round a free-wheel pulley mounted on the clutch shaft and held at its other end by a spring. To start the engine it is only necessary to open the distributing cock, when by the action of the piston the clutch shaft is quickly rotated and the engine started.

The Palmer Tyre, Ltd., are well to the fore in the tyre section; their exhibit, owing to the more extensive space available, is much more attractive than at Olympia, the cording machine (shown in operation) drawing crowds of interested spectators. Palmer cord tyres have been well taken up on the Continent, and the company have found it necessary to establish a

larger depot at 152, Avenue Malakoff, Paris. The Société des Pneumatiques Ripert, Paris, show a somewhat novel tyre; the cover is made of rubber and canvas as usual, but the tread consists of a series of strips of leather set on edge and held close together and in place on the tyre by rivets. In addition the Dunlop, Continental, Hutchinson, Michelin, Kempshall and Gaulois tyres are all on view. Considerable interest is being taken

Fig. 9.—Cross Section of E.N.V. Eight-Cylinder Engine.

C.—Inlet pipe. F.—Cam shaft.

in the twin pneumatic tyres for heavy touring cars shown by the Michelin and Gaulois Companies.

A brief reference was made to the E.N.V. car in our last issue; this is one of the most interesting vehicles in the show, and is the production of an English company, known as the E.N.V. Motors, Ltd.—in which several well-known English motorists are interested—with works at Courbevoie, near Paris. The motive power is supplied by an eight-cylinder, V-shape engine (Fig. 9) the cylinders of which are cast in pairs and provided with electrically deposited copper water jackets. The clutch is of the contracting band type and closely resembles a brake. Apart from the engine, one of the most noteworthy features lies in the transmission. Four speeds forward and a

Fig. 10.—Sectional Plan of E.N.V. Gear-Box, giving one forward speed and a reverse motion.

reverse are available; the usual gear-box is replaced by a small carter (Fig. 10) in which the engine can be coupled up direct to the back axle or by means of intermediary pinions the first and reverse speeds obtained; at the end of the cardan shaft are two loosely-mounted bevel pinions each in gear with concentrically arranged bevel crown wheels on the back axle. Thus arranged, while the gear-box only gives two speeds, as this can be transmitted through either of the pairs of bevels, four speeds are altogether available. The E.N.V. Company are also devoting attention to

the construction of light engines for aeronautical purposes, and have on view one comprising eight cylinders (100 mm. bore by 130 mm. stroke) set in the form of a V. It is stated to develop 55-h.p. at 1,000 revolutions per min., and weighs complete 308 lbs.

There are only two friction-driven cars to be seen, the Turicum, which has already been illustrated in the *M.C.J.*, and "S.P.M.A." The latter is a 10–14-h.p. four-cylinder vehicle and is made by the Société Parisienne de Mécanique Appliquée, of Courbevoie. In general arrangement the car follows the usual lines of bevel-gear-driven vehicles; on the back axle, however, are mounted two large discs which are driven by a small friction pulley on the end of the cardan shaft. The pulley is so arranged that its position in relation to the large discs can be varied, and any speed between the minimum and maximum obtained. The friction pulley is controlled by a side lever as usual; when a change of speed is made the pedal has first to be depressed, the effect of this being to slightly move the discs on the back axle away from the driving pulley.

An advance in design is afforded by the 8-h.p. Clement-Bayard. The four cylinders (65 mm. bore by 100 mm. stroke), with engine base, exhaust and intake manifold, are in one casting; the crankshaft is naturally supported on the upper portion, for no lower casting exists, the sheet metal casing forming an oil pan secured along the sides and ends by a steel band drawn tight by a single screw and nut. The valves are on one side and the sparking plugs placed directly over the inlets, the magneto being

Fig. 11.—The Rip Voiturette.

at the front of the engine. The mounting of the engine is somewhat original, there being radiating arms front and rear; each terminates in an eye-hole, through which passes a steel tube with flattened ends to allow its being bolted to the side members of the frame. Thermo-siphon cooling is used with a special type of radiator formed of flat copper tubes, of which the thin end is presented forward and faced by a metal grating to distribute the air currents. The same firm is showing a single-cylinder car somewhat on the same lines as the above, but without the sheet metal case to the crank chamber. In both cases the change-speed gear is of the sliding type, and the final drive is by cardan shaft.

Among the novel single-cylinder cars on view is the "Rip," (Fig. 11) of the Société des Voitures Automobiles "Rip," of Rivé de Gier. Particular interest centres in the suspension of the frame, no springs in the ordinary sense of the word being employed. The axles are attached to vertical guides connected with the side members of the frame in such a way that they can slide up or down according to the inequalities of road surface or weight. All shock is taken up by transversely and horizontally set coil springs, one to each of the four road wheels. These springs are equipped at their outer ends with chains which slide over a free sprocket, and are connected at their other extremities with the stub axle. Thus any jolt due to the wheels passing over inequalities in the road is communicated by the chain to the coil spring, which opens out under the jerk sufficiently to allow

the axle to slide vertically up the guides. The change-speed gear is located at the rear end of the cardan shaft, it being, however, directly supported on a cross member of the extremely low-set frame. Two models of this interesting vehicle are being made—one fitted with a 5-6-h.p. single-cylinder engine and the other with an 8-10-h.p. four-cylinder motor.

Fig. 12.—Elevation and Plan of Chameroir Belt-driven Car.

The Motobloc Company show the only single-cylinder engine with gear-box and crank case in a single unit. As this has already been illustrated in the *M.C.J.*, it need only be mentioned that the radiator is mounted on hinged bearings with suitable oil caps, this being intended to prevent straining of the tubes owing to any twisting of the frame.

A feature of the show is the reappearance of a number of small belt-driven cars; prominent amongst which is that shown by

Fig. 13.—Elevation and Plan of Chassis of Berliet 15-h.p. Car.

A.—Frame. D.—Radiator. G.—Flywheel.

C.—Engine. F.—Change gear lever. S.—Clutch pedal.

the Brouhot Company, of Vierzon (Cher). We gave an illustrated description of this vehicle in our issue of April 25th last. Since that time, however, several detail changes have been made, the most important of which is the adoption of ordinary semi-elliptic springs at the rear. The Truffault car shown on the stand of M. Bozier is fitted with a single-cylinder engine of 8-h.p. Mounted on an extension of the crank shaft are a couple of small pulleys of different sizes which convey the power to the back axle by V belts; as either of the pulleys can be brought into

action, a direct drive is thus obtained on both of the two speeds available. The suspension of this car is also on exceedingly novel lines.

M. G. Fouillaron, of Levallois Perret, is again present with his novel system of transmission by means of extending and contracting pulleys, the connection between the two being by a special form of steel and leather belt. In order to make room for the two pulleys within the width of a chassis of standard size M. Fouillaron locates his engine at a slight angle to the usual position. The two pulleys are located below the driver's floor board, the driven one being connected with the cardan shaft, which is also at an angle, and transmits the power to the back axle through the usual bevel gear. The various speeds are obtained by reducing the diameter of the driving pulley and increasing that of the driven one, and *vice versa*. We understand that a company has been formed in London to introduce this system into England.

M. Chameroir, of Le Vesinet (Seine-et-Oise), displays a little belt-driven car (Fig. 12) which forms an interesting attempt to produce a vehicle at the popular price of about £100. The engine is a 9-h.p. Aster; on an extension of the crank shaft is loosely mounted a three-step cone pulley, so arranged that while it is gear driven off the engine it has a slight play which enables the tension of the wide driving belt to be maintained or eased when changing speed; a similar three step pulley, combined with one step of which is a reversing gear, is mounted on a cross shaft, at about the centre of the car, from which the power is transmitted by a single chain to one of the rear road wheels. No

Fig. 14.—Plan of V.A.T.E. Petrol-Electric Car. (See page 870 last issue.)

differential gear is fitted, the opposite road wheel being loosely mounted on the axle.

The two most interesting models on the Berliet stand are a two-cylinder model of 12-h.p. and a four-cylinder car rated at 15-h.p. The smaller of the two has its cylinders in a single casting, high tension magneto ignition, a new type of carburettor directly connected up to the intake manifold, and thermo-siphon water circulation through a plain copper tube radiator carried on the dashboard. A cone clutch is employed and a shaft drive. The four-cylinder model (Fig. 13), which should prove a very popular type of car, has its cylinders, of 80 mm. by 120 mm. bore and stroke, in two castings, with valves all on one side, thermo-siphon water circulation, with radiator in front, and ignition by Bosch high-tension magneto. The clutch is of the multiple disc type; the gear-box, which is mounted on two dropped cross members, is an entirely new pattern, of square shape, with none of the projections and corners which are usually given for the lodging of dust, grease and oil. It contains a double sliding gear providing four forward speeds and reverse, a direct drive being obtained on the top speed through the propeller shaft to the rear live axle. A distinctive feature of the new car is the excellent lubrication system. The base of the crankcase forms an oil tank, from which the oil is forced by means of a gear-driven pump to the crankshaft bearings, and by means of channels in the shaft to the connecting rod bearings. An oil tank is carried on the front of the dashboard, and on the driver's side is a tubular oil level, which indicates the quantity of oil in the engine when the motor is running. A couple of sight feeds with variable flow supply lubrication to the gear-box and the rear axle, the pressure only being maintained when the engine is in operation and the pump is working.

In dealing with the voiturette class one enters the realm of the assembled car, since some of the firms making a specialty of voiturettes lack the resources necessary for producing the entire

vehicle. Many of the firms employ a De Dion or Aster single-cylinder engine, with high tension magneto, thermo-syphon circulation. Sizaire-Naudin, Chenard-Walcker, and a few other firms, however, produce a car entirely of their own make. There seems to be a certain waste in respect to the space on these cars, owing to the disinclination of the makers to reduce the size of the body according to the power of the engine. Advantage is taken of this waste space in some instances to locate other organs of the car beneath the bonnet, the otherwise unoccupied area between the dashboard and the engine being taken up by the petrol, oil, and water tanks, and, in one case, a tool chest.

The Alcyon Company, of Neuilly-sur-Seine, who have given

Fig. 15.—The Alcyon 8-10-h.p. Four-Cylinder Car.

up the construction of single and double cylinder cars, are now devoting their attention to the production of light four-cylinder cars of 8-10-h.p. and 12-h.p. The first named (Fig. 15) has the four cylinders (62 mm. bore by 120 mm. stroke) in a single casting. The water circulation is by thermo-syphon, and the ignition is by Bosch high tension magneto, and the details of the transmission, which is to a live axle, comprise a multiple disc clutch and a three-speed gear-box with direct drive on top. The 12-h.p. car has the cylinders (75 mm. bore by 110 mm. stroke) cast in pairs, otherwise it is on similar lines to the 8-10-h.p. Both can be supplied with either two or four-seated bodies. Other light two-seated four-cylinder cars include the 8-10-h.p. De Cleves-Chevalier (Fig. 16), the Delage, the Reyrol, the Werner, the Stimula, and the Corre.

Fig. 17 depicts the somewhat novel car of the Société des Automobiles Stabilia, of Neuilly. As will be seen, the axles are

Fig. 16.—The De Cleves-Chevalier 8-10-h.p. Four-Cylinder Car.

located above the frame, which is directly supported from and not on the springs. It is claimed that not only is the stability—hence the name of the car—increased owing to the low centre of gravity, but that the various components are rendered more accessible, and that, owing to the fact that with a corresponding clearance to the ordinary design of car larger wheels may be used, resulting in an increase in the life of the tyres. The Stabilia Company are turning out cars of 8-10-h.p., 12-14-h.p., 14-16-h.p., and 20-h.p., all fitted with four-cylinder engines. Apart from the suspension, the vehicles follow the usual lines of live-axle cars.

A brief mention may be made of the chassis of Messrs. Donnadieu, Saussard and Robert. Both the engine and transmission of this car are on novel lines. The motor, which is air-cooled, has only one overhead valve to each of the four cylinders for inlet and exhaust. The change-speed gear, which is of the epicyclic type, is combined with the differential mechanism on the live axle.

The Westinghouse Electric Company show an ingenious jack for raising the wheels of motor-cars. This is operated by a lever with an up and down motion; the movement is the same both to raise the jack and to lower it, all that is necessary being to push over a small trigger. Another interesting jack is the "Passe Partout" displayed by M. H. Libert, of Charenton-le-Pont (Seine). This is made on the principle of a lazy tongs; by turning the handle the tongs extend; the jack, which is perfectly rigid, when fully extended is 17 in. high, while when folded up it is 2½ in., so that it occupies an extremely small space.

Amongst the non-skid devices on view are the Durandal, the Fournier and the Samson. All the leading makes of detachable rims are to be seen, the most prominent of the new comers being the Alpha, which is made by the Adlerwerke Gesellschaft, of Frankfurt-on-Main. This is on somewhat similar lines to the Dunlop and appears to be a very effective arrangement.

The fact that magneto ignition is now enjoying a big wave of popularity is naturally giving an impetus to the manufacture of magnetos, of which quite a number are on view, amongst them being the Bosch, Eisemann, Gianoli, Nieuport, Nilmelior, the Ruthardt and the Unterberg. As usual a number of spring wheel devices intended to furnish all the advantages of pneumatic

Fig. 17.—Chassis of "Stabilia" Car, in which the frame and the whole of the engine and driving gear are directly supported on the springs.

tyres without any of their drawbacks are to be seen. The one that is attracting considerable attention is that known as the Paulson.

A good deal of attention is still being given to shock absorbers in connection with the springs of motor-cars. One that is just now receiving considerable notice is the Houdaille, in which glycerine is used as the cushioning medium. Automatic tyre inflators form another interesting group of exhibits, among them being the Vadam, the Phono-Pompe, the Rapid of M.P. Pestourie, the Valantin (shown by M. Mazaudier, Paris), and the Ajassan de Grandsagne, which we understand is being introduced into England by Messrs. A. Dunhill, Ltd. Several firms are paying attention to the production of steel pistons, cylinders, &c., among them being the Société Metallurgique de Monthard-Aulnoye, who are represented in England by Messrs. Hamilton, von Glehn and Co., of 40 Trinity Square, E.C.

The British motor chain manufacturers—Messrs. Hans Renold, Ltd., the Coventry Chain Company, and Messrs. Brampton Bros.—each have a representative display of their productions. All the well-known lampmakers are well to the front, among them being the Bleriot, Ducellier, Alpha, Troubetzkoy, Rushmore, and the Autoclipse of Messrs. Brown Bros. Other British firms exhibiting include the United Motor Industries, Messrs. Harvey Frost and Co., with their vulcanisers, Fastnut, Ltd., with their well-known device, Messrs. S. Smith and Sons (speedometers), the Stepney Spare Wheel Co., and Messrs. H. M. Hobson, Ltd. (Hobson-Pognon sparking plugs).

MOTORING THROUGH EUROPE.

ALTHOUGH Mr. Roy Trevor's attractive book, "En Route,"* reached us during the autumn, we delayed its perusal till the period of fog in London and shortened days in the country came upon us. For it is a volume that should be read by the fireside, when the traveller can recall scenes he has known, and find pleasure in learning how other people were impressed. Mr. Trevor has a good capacity for enjoyment and for communicating to others something of his sense of pleasure. His roamings have been in several lands, of varying altitudes and climatic conditions, and with a keen scent for the picturesque in nature he lures us from page to page as smoothly as though we were in the company of Sheila, the beautiful, or Dorothy, the brunette—two very companionable friends who were passengers in his Mercedes over the Alps and through Italy into the Tyrol, with many incidental glimpses along the line of route.

The volume has a somewhat conventional preamble, and the

had been a rabid motor hater. He eagerly questioned me about the car, how it was worked, and listened with interest to my explanation of cylinders, magnetos, gears, and all the hundred and one things that go to make up the intricate workings of an automobile. At last the microbe of automobilism had entered his blood, and I knew that never again would he rave against cars. His next wish would be to handle a living power, and, like the boy in the bath, he would not be happy till he got it."

Hitherto the party had always regarded France as the highway to other lands; now, as they traversed the fine straight highways they came upon old towns with the honoured battlements and noble monuments, and saw, for the first time, the real country, receiving quite a new insight into the delightful land. It was an onward rush from the capital, and then through Troyes to Besancon they were carried on the wheels of the speed god—for no Inspector Marks or Sergeant Waghorn or Surrey J.P. interferes with travel there—to the gate of Switzerland. Passing the officials at the French frontier "a short and easy climb brought us to the summit of the Col de Roches, where the road passes through tunnels bored deep into the rock, and emerges

The Col de Roches—the road passing through tunnels bored into the rock.

usual argumentative disquisition as to whether to motor or not to motor, one of the prospective tourists being somewhat embittered against "condensed horseflesh," as he, with bucolic perception, named the engine beneath the bonnet. At dinner in Paris on the evening before the tour the party raised their glasses to drink success to the adventure. "Let us be merry to-day for tomorrow we start," added this somewhat less-willing-than-the-others sort of person. He was converted from that attitude after passing the Bois de Vincennes and getting on to the Nancy road. The manner of the change is thus told by Mr. Roy Trevor:—

"Now," I said, as we rounded the bend and saw before us a perfect stretch of road, clear of traffic, and losing itself in the distance, "now you shall feel what Mercedes can do." Silently we tore along, and by imperceptible degrees I increased the speed; the delight of motion, the fresh breeze blowing in our faces (for the wind screen was up) combined to make us feel that life was indeed worth living. I instinctively knew that Ken was catching the motor fever; no longer did he sit like a waxen image, his eyes sparkled as he gazed through his goggles, his colour heightened by the quick rush of air, and the whole set of his figure told me that he had forgotten that but a short half-hour ago he

before the doors of the Swiss *douane*." The way was then *via* Neuchatel, Berne, Lucerne, to the great St. Gothard—the pass of which has not long been open to automobiles, the drivers of which have to secure a permit from the official at the station at the foot of the rock.

"There are a few rules you must observe," said he. "Automobiles are forbidden on the pass between the hours of five and eight in the morning and seven and nine in the evening. On meeting any conveyance, you must always take the precipice edge of the road, and must, if required, silence the motor. And lastly, you must accept full responsibility for any damage or accident that may happen in consequence of your automobile's presence upon the road. Here, monsieur, is your pass, and I wish you bon voyage."

The moonbeams were being slowly strangled by the pale light of breaking day, and between the great mountains, rising on either side of the valley, stretched a narrow arc of sky still dotted with innumerable stars, flashing like diamonds upon a velvet cloth. From Goschenen the road winds upwards and enters the Schollenen, a dark sombre defile through which the Reuss tears down its rugged bed, its path strewn with enormous boulders. The perpendicular sides of this fearsome valley rise up sheer from the stream, devoid of all living things save where patches of moss and grass alone seem able to obtain a resting-place. The road passes under an avalanche gallery and winds itself in short zig-zags, ever climbing amidst scattered rocks, till, on rounding a mass of stone, it enters the gorge spanned by "The Devil's Bridge." A

C

* "En Route." A Descriptive Automobile Tour through nine countries and over nineteen great passes of Europe. London: Edward Stanford.

more wild and savage scene it is difficult to imagine. The gorge is narrow; the rocks rise up sheer to a great height—on one side the Reuss leaps over a precipice in one foam-enshrouded mass, falling into an abyss 100 ft. beneath the bridge, which it envelopes with its spray, carried far out from the stream by furious gusts of wind which come howling down the ravine.

"A doleful place: hemmed in with earthen precipices."

The scene is awful enough in broad daylight, but illuminated by the uncertain light of dawn it was weird in the extreme.

The wind was shrieking down the gorge, carrying spray from the cascade and dashing it against our faces as we crossed the bridge, and continued to rise in windings. A little fort, hardly distinguishable from the black shadows of the rocks, gazes down upon the bridge, and, stopping Mercedes, we descended and walked toward it, hoping to obtain a better view. As we advanced, two dark shadows detached themselves from the blackness, and we found ourselves looking upon the cold steel of two bayonets, whilst a voice bade us return immediately to the road. It was a command to be obeyed, and we at once retraced our steps. Mounting to our seats, we plunged into a tunnel bored through the rock, and emerged, wonder of wonders, in a peaceful green valley enclosed with snow-tipped mountains.

That night they discussed the wonders of the Gothard in the hotel on the shore of Lake Maggiore. In the morning they started over the Simplon road to the Matterhorn, later negotiated the Italian Customs, had a few days by Lake Como, and then

SOME USEFUL NOTES.

THE entire ignition wiring of a car should be carefully examined from time to time for signs of wear in the insulation. At certain places the wires are exposed to continual, if slight, friction, which will ultimately break through the insulation and establish a short circuit. The timely application of a little insulating tape will often save much trouble in this respect.

COMPARATIVELY few owners and drivers of motor-cars seem to realise the necessity of oiling not only the spring shackles but the leaves themselves. The latter should be lubricated, if for no other reason than eliminating the annoying squeak that accompanies a dry spring. The best lubricant for this purpose is a mixture of ordinary oil and graphite or the regular graphite grease that is on the market. To facilitate the injection of the grease between the leaves, the frame of the car should be jacked up until the axle partially hangs by the springs. This will open the leaves, and with the aid of a thin stick the grease can be spread easily. A screwdriver or similar tool can be used with-

The Glories of Pisa.

made way for Austria by the Stelvio Pass. Ultimately, at an altitude of 8,000 ft., they came in view of the lonely Cantoniera Santa Maria, the highest permanently inhabited house in Europe and the seat of the Italian *douane*. At length:—

We bade goodbye to the lonely little house, lost amidst the rocks, and continued the ascent. In a moment all our petty troubles were forgotten in the silent contemplation of the scenes through which we were being swiftly carried. It would be impossible to describe the awful desolation that lay around us, neither pen nor photo could ever reveal a thousandth part of the wildness and magnificence of the scene. Above and beneath us the road writhed like a serpent in agony amidst the rocks; overhead the snow-line into which the mountains rose appeared to be falling. On rounding the last turn we reached a tiny plateau. At the foot, or, as it seemed, upon a gleaming glacier, stood a small white house at whose door the road suddenly disappeared. Around and about rose a towering mass of snowy peaks and streaming glaciers.

This was the summit of the Stelvio, the meeting-place of the three frontiers, 9,200 ft. above the sea, and the highest carriage road in Europe. From the door of the hotel a startling scene is presented on looking down the descent towards Austria. Imagine a world of rock split as though by a gigantic wedge, forming a valley, whose sloping sides rise from a silvery stream into the glaciers. At the further extremity of the road, as far as the eye can reach, is a little pin-point of houses, Franzenshohe, the Austrian *douane*. This is but one-fourth of the whole descent, the road here disappearing into the pines.

(To be concluded.)

out harm to further spread the leaves if necessary. It is best to be liberal in the application of this grease to insure its being squeezed over the whole surface when the frame is let down. The surplus can be wiped off, and with this treatment the leaves will not require attention for another season.

WHEN replacing a broken ball in a ball bearing it is better to renew the whole set, unless the new ball can be carefully gauged to be of the same size as the others. If this is not attended to, the new ball, having to bear more than its share of the weight, quickly succumbs. The greatest care should be taken, of course, to use grease free from grit, and to clean the balls and bearings before they are replaced.

WHEN assembling those parts of a car in which split pins are used, it is quickest to use new pins, and not those which have been removed in taking down the parts. Sometimes, however, the old pins have to be used, and difficulty is experienced in straightening them. A procedure which is generally effective consists in gripping the splayed ends of the pin between a pair of pliers and resting the heads upon some hard surface. A tap on the head of the pin spreads that end and closes up the other, straightening the pin and restoring it to its original shape, so that it may be replaced easily.

THE SOCIAL WHIRL.

THE Right Honourable Sir J. H. A. Macdonald, K.C.B., Lord Justice-Clerk of Scotland, is presiding at the conference between the Road Surveyors' Association of Scotland and the Scottish A.C. which is being held on the evening of the 11th inst. The basis of the discussion will be the reports of Mr. Robert Drummond and Mr. J. R. Nisbet on the recent International Road Congress.

THE Earl of Lonsdale has consented to take the chair at the dinner to Mr. de Rodakowski which will take place in February. It had been intended that this should be held next month, but Lord Lonsdale has no spare evening in January.

ACCORDING to the "Motor Trader," Mr. Oliver Stanton was acting as instructor to King Edward VII. when he was Prince of Wales. While at Cannes with H.R.H. a casual motor-car ride was taken, with the result that not long after the Prince announced his intention of taking to motoring, and instructed Mr. Stanton to buy him the best British car he could get. A visit to Cordingley's Show decided Mr. Stanton to order a 6-h.p. Daimler, then he took it to Ascot, and the rest is history.

MR. RUDYARD KIPLING is a candidate for membership of the Sussex Motor Yacht Club, and it is possible that he will take some active interest in the arrangements for the next "scouting" event organised by the committee. The necessary alterations have been completed to the new club house, the formal opening of which will take place on the 19th inst.

THE first of the bronze medals awarded by the R.A.C. for continuity of service and good conduct was presented to Mr. Frederick Hill, driver to Mr. A. E. Thompson, Westbrook, Sheffield, on Saturday. Mr. Hill has held both the Club's driving and mechanical proficiency certificates for the past three years, and has, during that period, been in the service of Mr. Thompson.

THAT enthusiastic motorists are not insensible to the charms of horsemanship is proved by the fact that a considerable number of members of the Motor Club assemble every morning for their matutinal ride in the Row. A strong Polo Committee is actively at work, and the Motor Club Polo Team may be expected to give a good account of itself next season. The secretary, Mr. Edmondson, was formerly manager of the London Polo Club. As such well-known players as Messrs. Herbert Rich, Humphrey Freville, and H. Antony Browne are on the committee, great things may be reasonably expected.

MR. E. R. PICKMERE, the Town Clerk of Liverpool, reports that up to the end of September there were registered for private use in that commercial city 1,294 motor-cars. One hundred and eighty-five motor vehicles were registered for trade use and seventy-eight for public service, making a total of 1,557 motor vehicles officially recorded in the twelvemonth. Eight hundred and eighty-three motor-cycles were also registered and licences issued to 1,493 motor-car drivers. From Wolverhampton comes the news that during the year ending September 30th forty-six motor-cars and thirty motor-cycles were registered, while licences were issued to 305 drivers.

DURING the past week Capt. Townshend, of Hungerford, and Capt. C. H. Fenwick, of Malmesbury, have decided to obtain Sheffield-Simplex cars, as have also Mr. Walter E. Case, of Frome, and Mr. Allan McOnie, of Buchlyvie.

CAPT. ERNEST G. PRETYMAN, who won the Mid-Essex Division last week, and returned to the House of Commons, is an addition to the ranks of motoring M.P.'s. He joined the R.A.C. shortly after his defeat at the last general election, and his success brings the number of club members in the House from 52 to 53.

MR. C. I. THORNTON, the well-known cricketer, is also an enthusiastic motorist, and is often seen on the southern roads. He intends to winter in India, not returning till the spring.

LOLLIUS.

HERE AND THERE.

THE Churchill Motor and Cycle Company are opening an establishment in Churchill Place, Edinburgh.

A GARAGE solely for commercial cars has been opened in the New City Road, Glasgow, by Mr. Alexander Kennedy.

THE General Committee of the R.A.C. has agreed to accept an application for the affiliation of the Automobile Club of China under the standard "Colonial" agreement.

MESSRS. S. SMITH AND SONS, LTD., 9, Strand, London, W.C., have brought out an excellent cartoon in which their Speed Indicator is shown as being accepted in evidence by a judge of the High Court. to the consternation of the counsel for the police and others engaged on the other side of the case. This, of course, is based upon experience. Among the seasonable novelties which are to be found in the establishments of those who cater for motorists is a perfect model of a motor-car side lamp and head light which has been introduced by Messrs. S. Smith and Sons, of Speed Indicator fame. It contains a sound and reliable watch movement. This is illustrated in the accompanying Fig. 1 so far as the side lamp is concerned. The model headlight is an equally attractive novelty. These are guaranteed timekeepers, are wound and set from the front, and are supplied in beautifully finished brass or copper cases. As presents between one motorist and another they ought to solve the problem of "what to give to our friends at Christmas."

Fig. 1.

Fig. 2.

AWAY in the clerestory of Lincoln Cathedral the corbel on one of the arches ends in a cross-legged, wide-mouthed and prominently-eared little elf who has become known to fame as the Lincoln Imp. A fine brass casting has been made from the original of this curious Imp (Fig. 2), the presence of which was pointed out to motorists attending the meet of the R.A.C. nearly two years ago by Canon Hicks, and this is being suggested by Messrs. A. W. Gamage, Ltd., Holborn, London, E.C., as a Mascot for motorists. Locally the citizens of Lincoln regard the wearing of the Imp on watch-chain or bangle as a charm against danger, and on the car it should exercise similar fascination, although probably in remote districts it might lend semblance to the story of the car's connection with the Evil One. It is made with a plate to screw down on to the top of the radiator or on any other prominent part of the car.

THE Siddeley 20-30-h.p. six cylinder chassis on the Wolseley Company's stand at the Paris Salon bears the legend "sold to Madame Fallieres." The fact that the wife of the French President should have chosen this vehicle is a feather in the cap of British motor-car builders.

MESSRS. J. B. BROOKS AND CO., LTD., of Great Charles Street, Birmingham, have a large selection of seasonable articles, such as Thermos flask cases, weather-proof umbrella cases, as well as novel baskets and wickerwork receptacles for luncheon and tea, in their department devoted to goods for the convenience of motorists when on tour. Trunks and luggage carriers of every kind are supplied by the firm, who will be pleased to send their catalogue to any of our readers thinking of winter travel.

THE Worcestershire Chamber of Agriculture has adopted a resolution in favour of further restrictions being placed on the speed of motor-cars.

WE hear that M. Fabry, of the Itala Automobile Company, is at work on the construction of a new aeroplane, with which he hopes to commence trials early next year.

A LOCAL computation places the fines imposed by the Spittle-gate (Grantham) magistrates on motorists since the Motor Car Act came in force at two thousand pounds.

REPLYING to a proposal that the control of tramways be included in the Town Planning scheme lately before a Committee of the House of Commons, Mr. John Burns remarked that if they included such vehicles, why not motor-omnibuses and motor-bus routes; and if motor-buses, why not aeroplanes? Why not?

THE German Daimler Motor Company have recently patented a double cone clutch, of which a sectional view is shown in the accompanying illustration. The operating pedal A is mounted on the frame of the vehicle and to its shaft is secured a cam piece B, which acts on a bell crank C. The latter connects through a pair of rods with forked ends to the ball-bearing trunnion collar D on the hub E, to which is secured one of the pressed steel cones. The hub E is arranged to slide freely on the shaft F, which is provided with four feather keys. Concentric with the hub E is arranged another hub G, to which is secured a second pressed steel cone. The two hubs are pressed apart by

the coiled spring H, whereby the two cones are forced into engagement with their respective female cones formed in the flywheel. At the forward end of the shaft F are pivoted two short double armed levers I and J. The upper arm of one of these levers and the lower arm of the other bear against projections of the inner hub and the other arms of the two levers bear against projections of the outer hubs. The effect of this arrangement is that when the rearward cone is pushed forward by means of the pedal A, the forward cone is simultaneously drawn backward, thus insuring positive disengagement of both cones.

WE learn that a company, known as the Aeroplane Engine Company, Ltd., has been formed, with headquarters at the Redbridge Motor Works, near Southampton, to manufacture the eight-cylinder engine exhibited by Mr. W. L. Adams at the Cordingley Show in March last. The company have orders in hand for a number of these engines, which are of 100-h.p., including one for Lord Royston, one for Mr. P. Warren, of Brighton, one for a new hydroplane which is being built for the Monaco meeting, and one for a new racing car which will probably be seen on Brooklands track next season.

A CURIOUS feature of the Paris Salon is that most of the novelties are known by names made up of the initial letters of the firms showing the same; for instance, the V.A.T.E. petrol electric car, the D.S.R. car, with change-speed gear on the back axle, the R.I.P. car, the E.N.V. eight-cylinder vehicle, &c.

THE Lewes Literary Society has just attracted attention to itself by deciding that motors are a nuisance, after a debate upon the subject.

SEVERAL agents of the Humber Company have presented a testimonial to Mr. A. S. Butt, who was for many years sales manager in the motor-car department of the Humber Company.

THE Home Secretary has had a report from the City and Metropolitan police that the smoke nuisance that was originally associated with the motor-buses in London has undoubtedly decreased.

ONE feature of the Paris Salon which is this year conspicuous by its absence is the Tombola. In previous years all visitors purchasing a catalogue were given a numbered ticket which entitled them to a chance for one of the many prizes offered to the exhibition authorities by different firms in the trade.

THE Silver Seal scheme introduced in connection with Pratt's Motor Spirit has been the subject of a great deal of misunderstanding, not only on the part of consumers, but dealers as well. The primary object of the scheme was, we are informed by the Anglo-American Oil Company, Ltd., to impress upon the consumer the necessity of assuring himself of the perfect sealing of the can of spirit when delivered to him, which in the opinion of the importers is the only possible guarantee to the consumer of its purity. This object being attained, and the scheme being only operative till the end of February, it will then be withdrawn.

FROM the Société Lorraine-Dietrich, of 5, Regent Street, Waterloo Place, S.W., comes a copy of the new catalogue of the Lorraine-Dietrich cars. This is one of the most handsome productions of the kind that has reached us for a long time; not only are the various types of cars fully illustrated and described, but a number of interesting views of the company's works, as also of its cars, in various parts of the world are included, while interlarded with the pages are a number of plates in colours depicting the various uses to which automobiles are now being put. The company is, we understand, only issuing a relatively small number of these catalogues, so that early application should be made by any of our readers desiring a copy.

MR. GERALD BISS is becoming quite a prolific writer of fiction, and his latest story, "Branded," is as full of excitement as anything he has written. It opens with a gloomy scene at the Old Bailey, and ends with the merry tinkle of wedding bells. Between these two extremes are tragedies, flirtations, social difficulties, unsocial doings, and many of the complexities that darken the modern world. Fortunately for the happiness of all concerned, a motor-car mishap towards the end of the volume gives opportunity for the original wrong to be righted—as far as is then possible—and the story ends in the orthodox fashion, leaving the reader to imagine that "they lived happily ever after." Incident moves rapidly in the pages of "Branded." As a writer of fiction Mr. Biss is going forward, and a little care with regard to such domestic scenes as are pictured in one of the later chapters would hasten his passage to the front. The general domesticity of Ralph seems hardly in accord with some of his language in that part. But that, perhaps, is a detail in a volume that will have many readers. It is published by Messrs. Greening and Co., Ltd.

WE learn that Mr. C. R. Garrard has severed his connection with Messrs. Clement-Talbot, Ltd., and has taken over the position of works manager to the Sheffield-Simplex Motor Works, Ltd. Mr. Garrard's connection with his old firm dates back to a period earlier than the opening of their works at North Kensington, which he schemed out, organised and supervised from a bare piece of ground, being, of course, subsequently responsible for the design and production of the well-known Clement-Talbot cars. Mr. Percy Richardson, the managing director of the Sheffield-Simplex firm, who has up to the present been responsible for the design and production of the Sheffield-Simplex cars, is also well known as one of the earliest pioneers of the trade, and the association of these two gentlemen should form a very strong combination. With the advent of Mr. Garrard it is the intention of the Sheffield-Simplex Motor Works, Ltd., to produce smaller models in addition to their two existing types of 45-h.p. six-cylinder cars. These will embody the same refinement in detail and high class manufacture as the larger models.

CONTINENTAL NOTES.

French Motor-car Imports and Exports.

The French export trade in motor-cars and parts continues in a very depressed condition. The shipments during the ten months ending with October last, according to the returns now available, only amounted to £4,405,920, as compared with £4,824,440 in the corresponding period of 1907, a decline of £418,520. There has also been a shrinkage in the imports of foreign motor-cars and parts into France from £283,440 to £246,240.

Industrial Motor Vehicle Trials in Switzerland.

The Swiss Automobile Club, in conjunction with the Swiss military authorities, are organising a competition of industrial motor vehicles, which is to take place at the end of June next. There will be only one category provided, this being for vehicles having a carrying capacity of 2½ tons. Motors using any form of fuel will be eligible to enter, and in addition to the load the body must have seating accommodation for three persons. To the rear of the chassis a hook must be provided so that a two-ton trailer can be attached. When this is done the load on the

ing up through the centre of the floorboard. The Lorraine-Dietrich Company is also adopting the idea, as in some of its new models the steering and control gear is so arranged that it can readily be adapted to either the left or right side of the front seat.

Motor Events in Italy.

The Italian Automobile Club has provisionally fixed the dates of the leading motoring events to be held in that country next year. The Voiturette Race in Sicily will be held on April 29th, while the Targa Florio has been fixed for May 2nd. The Grande Prix de Bologna and the Coupe Florio races will take place in the first fortnight of September.

Aeronautical News.

The regulations have been issued by the Aero Club de France with regard to the prize of £500 offered by Messrs. Ruinart Père et Fils for the first aviator who succeeds in flying across the English Channel in a machine heavier than the air, and entirely self-propelling. The offer will remain open till January 1st, 1910. Attempts may be made only on Saturdays and Sundays, and the offer is open to all aviators, no matter of what nationality. The flight may be made from either the French or the English coast. Written notice

His Excellency Earl Dudley, Governor-General of Australia, arriving in his Daimler Car at the Caulfield Races, "Guinea Day," Melbourne.

vehicle will be proportionately reduced. The trials will extend to ten days, the daily journeys averaging 100 kilometres; a minimum speed of 10 kilometres per hour will be required. The awards will be based on the regularity of running, hill climbing capabilities, the suspension of the chassis, the behaviour of the tyres, and the running costs per ton-kilometre of useful load. Simultaneously with the trial of military lorries the Swiss Club will hold a competition of all classes of industrial motor vehicles, full particulars of which will be announced at a later date.

The Position of the Steering Wheel.

A discussion is taking place in France as to the position of the driver's seat on motor-cars. Seeing that the rule of the road in that country is the opposite of that which obtains in England, it is urged that the proper position for the steering wheel is on the left, so that the driver, who, when overtaking other vehicles has to keep the same on his right, will have a clearer view ahead than he has at present. One of the strongest advocates of the idea is M. Charron, of the Charron Company, who considers that if the driver's seat on cars for use in France was on the left instead of on the right, the number of motor-car accidents would be reduced fully 50 per cent. It is, therefore, not surprising to find that several of the Charron cars on view at the Salon are arranged in this way, the change-speed and brake levers extend-

must be given sixty days before the attempt is to be made, and this notice must be accompanied by an entrance fee of fifty francs.

—Wilbur Wright made two flights of ten and twenty-five minutes' duration respectively at Le Mans on Friday, last week, having a passenger with him on each occasion.—It is reported that the Marquis De Dion is now having an aeroplane built.—Mr. J. T. Moore-Brabazon succeeded in making several short flights on his aeroplane at Issy les Moulineaux last week-end.—Professor Schuette, of the Dantzig Technical High School, is at work on a new airship. The vessel will be 100 metres long, and be fitted with a 120-h.p. engine.

Miscellaneous.

La Société Co-operative de Taxi-Autos Le Phénix is the name of a company which has just been formed at Levallois-Perret, Paris, to start a service of motor-cabs on a co-operative basis.—The Danish military authorities have just acquired a 24-h.p. Fiat motor-lorry.—Twenty-five entries were received for the competition of tyre inflating devices which was held at the garage of the A.C.F. on the 7th and 8th inst. The result will be announced later.—A proposal is under consideration to establish a State school for the training of chauffeurs in Hamburg.—The municipal authorities of St. Petersburg are about to carry out some trials of motor fire engines.

MOTOR ACCESSORIES.

The Victor Wheel.

In our report of the Stanley Show we referred to the "Victor" motor wheel, an illustration of which, with the flange detached, is given in Fig. 1. This is being introduced by SHEPARD'S PATENT MOTOR WHEEL COMPANY, The Foundry, Bridgend, Glam., and has merits in its simplicity, as well as the evident efficiency of the device. It has been tried for twelve months on a White steam car, and has rendered a good account of itself. As previously mentioned, the detachable flange is the special feature of the wheel, which gives it a decided advantage, and enables the secure and rapid fitting of another cover without the assistance of tools

Fig. 1.

other than the screwing handles, which are part of the device.

The "Exide" Accumulator.

The recommendations of the Society of Motor Manufacturers and Traders with regard to the standardisation of accumulators have attracted some attention. They suggest that the capacity be taken at the 20-hour rate of discharge with an interval of rest after ten hours. The Chloride Electrical Storage Co., Ltd., of Clifton Junction, near Manchester, in their new "Exide" accumulator, have taken the ignition capacity as double that at a continuous discharge at the ten-hour rate, thus being better than the S.M.M.T. rating. In this accumulator the plate is of the "cage" type with a grid on each surface, the active material between being continuous. Wood diaphragms are employed to separate the plates. By a special process of treatment the diaphragms are rendered exceedingly porous, while the injurious constituents of the wood are also removed. It is claimed by this process that short circuits between the plates are obviated, that the capacity of the plates is maintained throughout their life, that the loss of charge on open circuit is prevented, and that the internal resistance of the cell is not increased.

The Jones' Speedometer.

We illustrate in Fig. 2 a new model (No. 27) of Jones' Speedometer, which gives a reading up to 50 miles per hour, and also a mileage recorder for the season's running. This is fitted with the Jones' enclosed cumulative mileage recorder, and although supplied at a moderate price, has all the qualities of good workmanship which have given this device such an enviable position on the dashboard of cars. Messrs. MARKET AND Co., 6, City Road, Finsbury Square, London, E.C., are the agents for this speedometer, which, we need scarcely remind our readers, works on the principle of centrifugal force. They recommend that the drive should be taken from the front or steering wheels, but, where desired, can supply the Jones device with direct drive from the cardan shaft. The speedometers are covered by a twelve months' guarantee as well as by one against imperfection in material and workmanship.

Fig. 2.—The Jones Speedometer.

A Car Locker.

Among the many accessories which are stocked by Messrs. Mestre and Blatge at their London headquarters, 20, Store Street, Tottenham Court Road, W.C., is a locker for use on a car. We recently inspected this excellent device, which should prove of value to agents and repairers, who, in renovating cars for clients, will often find it useful to make an

addition to the fittings, thus giving novelty to their work. This locker is made to fit on the running board of the car. It has a quartette of drawers, which are covered by a couple of doors of the ordinary cupboard type and form a pleasing front to the locker. The whole of the contents can be easily got at and the divisions enable the separate keeping of little articles and accessories which have a tendency to stray under ordinary conditions.

Charging Ignition Accumulators.

We illustrate in Fig. 3 the latest design of the combined alternating-to-continuous current transformer made by the CAYPO ELECTRICAL COMPANY, 155-157, Bermondsey Street, London, S.E. The machine has been designed to enable those situated on alternating current mains to charge ignition accumulators in the most efficient possible way. In the old pattern machine the makers found that it

Fig. 3.

was impossible to obtain more than 100 watts on the secondary without the machine overheating, and they have therefore now made both the motor and dynamo considerably larger in order to overcome this objection. The machine is now capable of giving 120 watts output, namely, 15 volts 8 amperes, rating it at 7 amperes output. It is fitted with radial carbon brushes instead of copper gauze, as previously, as by slightly increasing the size of the dynamo it is possible to obtain the same output with carbon brushes as with the copper.

A Hand Lever Bench Shaping Machine.

So many motorists are interested in the mechanical side of the workshop that they have become familiar with the range of machine tools which Messrs. Drummond Bros., Ltd., of Ryde's Hill, Guildford, have brought out for the equipment of automobile and other repairing establishments,

Fig. 4

as well as for engineering works generally. We illustrate in Fig. 4 the firm's hand lever bench shaping machine—an appliance which will save its cost in files in a very short time as well as do work which would be practically impossible to do with the file with accuracy. It is fitted with a machine vice, swivelling to any angle, with hardened tool steel jaws, one of which swivels for taper work. If necessary, the vice can be removed so that the table is clear for work being clamped to it. A self-acting traverse both to right and left is provided for the table. The latter is raised or lowered by a screw operated by a hand wheel, and the whole machine—which is practically a reduced copy of well-designed shaping machines—is actuated by a hand lever. The tool is thoroughly practical and will take a good stiff cut, leaving a highly finished surface.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

ELECTRIC LIGHTING FOR MOTOR HOUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader of the *M.C.J.*, I am pleased to be able to state my experience of the Boron battery for either charging or lighting. I have a garage set comprising twelve cells, with these I keep all my accumulators in first-rate condition; they are 40 and 60 amp. hour capacity; it costs me about 6d. per charge for this size, using the patent lead negatives as retainers for the zinc, which is a great saving. I usually use two lamps in series, equal to 20 c.p., but can light more when required. Taking everything into consideration, it is very satisfactory to be able to have a good electrical current at one's disposal without the aid of a noisy gas engine and dynamo.—Yours truly,

SATISFIED USER.

EXHAUST FUMES IN GARAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed in one of your recent issues a description of an apparatus, consisting of a flexible piping and a fan, used by the Automobile Club of France in their garage to carry away exhaust fumes and smoke. You mention this as being new, but I wish to draw your attention to the fact that the Burlington Carriage Co. have had their extensive premises in Oxford Street, W., fitted for the past six months with a

system of piping which extends along the roofs of the various shops. This system was designed by me, and you will notice by the accompanying photograph that I have so arranged the pipes that, in whatever part of the building a car or engine is standing, it is only necessary to connect a length of flexible tubing to carry away any smoke or exhaust gas which would otherwise remain and vitiate the atmosphere.

I think that an arrangement of this description should be compulsory in every garage or similar place where the running of a petrol engine for any considerable time is necessary, as it is otherwise quite impossible to ensure the well-being of workmen in enclosed premises where a petrol engine is emitting its poisonous exhaust gases. I may mention that it was owing to a paper read at the Royal Automobile Club on the noxious effects of carbon monoxide that my attention was directed to the designing of the above-mentioned system for securing purity of atmosphere in the workshop.—Yours truly,

L. DELANEY.

UNDER THE SKIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A great many folk put up with poor compression and consequent loss of power in the belief that re-boring cylinders will possibly weaken them and lead to overheating or other troubles.

Certainly re-boring in the ordinary way is not so advisable as grinding out with an abrasive wheel. The reason is that far less metal has to be removed by the latter process. This is because a worn cylinder has a hard polished surface or "skin," and the boring tool must get a clear cut under this in order to make a true job, and even then a finishing cut is desirable and perhaps subsequent lapping.

Now, in re-truing cylinders by grinding, a little carborundum wheel is employed which revolves at some six thousand revolutions per minute. Only about .001 inch is the depth of the cut taken each time the grinding wheel travels down the bore, and as soon as it is parallel and true no further operations are necessary. In this way the minimum possible amount of metal is removed.—Yours truly,

FOR ACER, LTD.

A. E. G. Craig, General Manager.

OFFSET CRANKSHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your issue of the 28th ult. some diagrams intended to demonstrate the advantages arising from the use of cylinders arranged out of centre with the crankshaft, or *desaxé*. I wish to point out that these diagrams are misleading, as it is assumed that the maximum pressure resulting from the explosion is reached after the piston has commenced its downward movement. This is not so; the highest pressure is reached at the dead centre, or when the piston is at its highest point.

I enclose a diagram which makes this clear. The highest point is reached by the piston when the piston pin, crank pin and main shaft axis are in line, as shown in my diagram; when the connecting rod has reached a vertical position, as shown in your diagram, the piston will have made some considerable progress on its downward stroke. The dotted line A shows the position of the crank when at top dead centre and the full black piston corresponds. When the connecting rod is vertical the crank pin will be at the intersection of the line B and the vertical centre line of the piston; the chord of the arc represented by the angle through which the connecting rod will have moved is represented by the vertical difference between the dotted lines A and B. This is set off on the piston by the line C, which shows the amount of descent made by the piston when the connecting rod is vertical.

The point is that at the moment of greatest pressure there is no more turning movement imparted to the crankshaft than when the centre line of the cylinder and crankshaft correspond; there is some slight reduction in pressure exerted on the cylinder wall during the working stroke, particularly in the case of an engine having a very short connecting rod, but the advantage is far less than the diagram published would lead one to imagine. As a matter of fact it is very difficult to say which is the side on which the pressure of explosion comes when examining a worn piston taken from an engine of the ordinary construction.—Yours truly,

INCANDESCENT.

A REMINISCENCE AND THE NEW KNIGHT ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In looking over a cherished heap, one that I suppose most motorists have, I mean my scrap collection, I chanced upon a little memento, a sketch of which I enclose. It brings to my mind a long past episode, when, years ago, proud in the possession of a car that usually did go, I started off one early morn to give an unbeliever in the automobile his first motor drive, which, by the way, he did not get, and the old gentleman I know has not yet forgiven me. He was staying at a boarding house somewhere Hammer-

The remains of the
Mushroom after its fight
with the Piston.

smith way, and I did hear how he awaited my arrival surrounded by his cronies. Alas! I learnt in the school of tribulation the folly of a would-be passenger's expectation, for while on the road I heard an ominous crack and the engine stopped. The plugs were clean, the commutator wipes were true, the transmission gear was healthy, but the starting handle would not respond to the efforts of my arm; after that shrill shriek of death I could not pull the engine round. A horse was obtained and I steered for home, with a single quadruped in front, cheered by the mockery of the small fry of the district. A post-mortem examination soon revealed the complaint. The stem of one of the inlet valves had fractured near to the mushroom, and the latter had fallen into the cylinder and indulged in a combat with the piston. The odds were about even; the piston was cracked, and the poor mushroom had many flats and wounds as a result of its impact with its adversary. When I visited the Olympia Show and saw the Knight engine, I regretted that in those days the sliding sleeve with ports was unknown,

and finding on my return the remains of the mushroom, the echo of the past was recalled, and I seemed to hear the silent footsteps of the future and present boom, against whose coming nought may e'er, at least so we are told, prevail, and thus these reminiscences of the past. Probably other readers may have had similar ones; but, and 'tis always the but, I wonder if the cure and prevention is not rather late. I do not think many valves, or any, now break, as in the present day they are made of hammered forgings, so perhaps the owners of ordinary cars will not have to scrap their old friends just yet. I for one am satisfied now with my motor mount; still 'tis an old saying:—

"Few all they need, but none have all they wish,
Unmingled joys here to no man befall,"
and this applies to motors as well as other things.—Yours truly,

H.

ASCERTAINING ENGINE SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you could instruct me as to the easiest way of ascertaining how many revolutions a petrol engine makes per minute.—Yours truly,

NEW HAND.

[A simple and convenient method is to apply a revolution counter to the end of the crank shaft. As few shafts are manufactured without

In climbing hills, if the engine is allowed to labour on top speed before the change on to second is made, one has usually to drop to first, but if the change is made before the engine slows down the car will go up on the second speed without difficulty.]

HEATING GARAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly inform me if gas-heating radiators are safe for putting into a small motor garage? Any information on the subject will greatly oblige.—Yours truly,

E. B.

[We do not consider that a gas-heating radiator would be safe in a small garage unless special precautions are taken. To all intents and purposes a gas-heated radiator is a naked flame, and near to the ground, where petrol fumes accumulate. We would suggest one or other of the following methods for warming the garage:—By a gas or oil-heated stove or radiator, in which the flame is entirely enclosed in fine metal gauze (of the mesh employed for miners' safety lamps) in which case the risk of lighting the flame has to be considered, for this can only be done by opening the gauze cover; by a radiator in which the burner is outside the garage, and the heat conducted inside by means of a suitable pipe; or, finally, by one of the new stoves now advertised which burn a special fuel that merely smoulders and does not get hot enough to ignite petrol

The A.C.A. Grand Prix Race.—Hemery (who took second place) finishing at the Grand Stand on his Benz Car.

the necessity, at one time or another, of being centred in a machine tool, a small countersunk recess will usually be found on the end. The pointer of the revolution counter is made to correspond with this recess, so that to use the instrument it is only necessary to insert it in the latter, maintaining sufficient pressure against the shaft to prevent any loss by slipping. One person should hold a stop-watch, while a second operates the revolution counter. By taking half-a-dozen consecutive readings of one minute each and averaging them up, any small errors in the handling of the watch and the counter will be compensated for.]

CHANGE-SPEED GEAR PROPORTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The three speeds of my car are designed to give 9, 18, and 27 miles per hour respectively. In practice, however, I find the second speed of but little use, for when ascending a hill too steep to take on top speed without the engine knocking, I have almost invariably to drop to first. I should be glad if you could inform me whether it would be an advantage to have the proportions of the second speed reduced so as to give, say, 14 or 15 miles per hour.—Yours truly,

W. FOSTER.

[We are afraid that our correspondent would not benefit much by lowering his second gear from 18 miles per hour to 14 or 15, as this amount would hardly be noticeable. No doubt if the gear were changed before the engine slowed down this would somewhat remedy matters.

vapour. Adequate ventilation in a garage is a great safeguard, and so also is the adherence to a strict rule never to strike a light inside.]

AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you please tell me through the columns of the *M.C.J.* the pressure per square inch on piston end of petrol vapour on any make of motor?—Yours truly,

E. T. B. SIMPSON.

[Assuming that this question relates to the maximum pressure at the moment of explosion, we may say that it varies very considerably in different petrol engines. The explosion temperature is determined from the compression pressure and the ratio of the explosion and compression temperatures. We should say that about 300 lbs. per square inch may be taken as a fair average with good petrol motors when the "mixture" is correct. Charts have appeared in the Press to prove certain points as to torque, &c., which showed a maximum pressure of 400 lbs. per square inch, but there is a lot of difference from an assumed diagram curve and what really takes place. Actual tests with high speed manographs show, in quite small engines, with a mean effective pressure of 80 lbs., a maximum explosion pressure of 240 lbs. per square inch.]

BENZOL.—To the correspondent who asks where Benzol can be obtained, we would refer him to the South Metropolitan Gas Company at Greenwich.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE R.A.C. has decided to raise the entrance fee from six guineas to twelve guineas for the next thousand members. This decision will not apply to applications received prior to the 1st of January, 1909.

A Dustless Road Committee has been formed, consisting of the present Dust Committee of the Club with others who have interested themselves in the matter with a view to making suggestions for future consideration.

The General Committee has discussed the system recently proposed by certain companies interested in the sale of motor spirit, and has come to the conclusion that the offer of money for the return of the seals from petrol cans is contrary to the best interests of the users.

The whole of the capital for the new premises has been subscribed and the plans are practically complete.

The members of the Herts County Automobile Club have decided to associate with the R.A.C. and will in future only be connected with that body.

Among the tests which have been suggested to the Technical Committee as likely to prove of importance if carried out are lubrication tests, certain efficiency tests in connection with heavy vehicles, and stability tests as affected by the size of wheels.

your association in placing patrols in this district has undoubtedly been productive of very good results, and complaints that cars travel through the town at excessive speed are far less frequent than they were. The chief offenders now are the drivers of taxi-cabs. The chairman desires me to express his sincere thanks to your association for the action they have taken."

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

ON Tuesday next a paper will be read before the London Branch of the Graduates' Section of the I.I.A.E., at 1, Albemarle Street, W., by Mr. Rex K. Hubbard, on "The Possibility of Two-cycle Engines for Automobiles."

There are several interesting and essentially different types of two-cycle engines, which will be briefly explained with the aid of diagrams. The principal disadvantages of the two-cycle engine are, according to the author:—(1) Leakage of crank case when used as a pump; (2) The exhaust difficulty. These are not so great as is generally supposed, and may be overcome. Two-cycle engines can be run under conditions usually considered absolutely prohibitive. The exhaust stroke of a four-cycle engine

The Fleet of Motor Fire Engines recently added to the equipment of the Berlin Fire Brigade. The vehicles are of the Mercedes-Electrique type built by the Austrian Daimler Company. *(Allgemeine Automobil Zeitung)*

MOTOR UNION.

THE total number of signs issued by the Union up to the end of November was 530, made up of sixty-nine special caution, 336 school, and 130 concealed turning plates. Rochester City Council is erecting on tramway posts nine M.U. danger signs at the spot where the London road crosses Gun Lane and Cuxton Road, Strood, and at the Angel junction at Strood, which is a dangerous place for motorists now that the tramway system has been constructed. The Sussex County A.C. has ordered five signs for schools and concealed turnings. The new sign to denote concealed turnings will be of the diamond shape approved by the Local Government Board.

AUTOMOBILE ASSOCIATION.

As a result of numerous complaints made by local inhabitants as to the danger and inconvenience caused by the speed of motor vehicles passing through Hounslow, the Automobile Association, at the instance of the Heston and Isleworth District Council, placed special patrols on duty at specified points where the traffic was greatest, for the purpose of regulating and restraining speed. The men have now been on duty for some months, and the secretary of the Automobile Association has received from the clerk of the district council a letter in which he says:—"The action of

is not entirely dependent on the piston. It is better to induce a charge into a cool chamber than a hot one. The principal advantages of the two-cycle engine are:—(1) The same torque with half the number of cylinders; (2) Greater simplicity; (3) Greater power weight for weight when under certain conditions.

Mr. A. Sharp will take the chair.

CHESHIRE.

THE annual dinner of the Cheshire Automobile Club was held on Wednesday last week in the Adelphi Hotel, Liverpool. Mr. T. H. Jackson, J.P., presided, and among those present were Mr. A. G. Jeans, J.P., chairman of the club; Sir Percy E. Bates, Bart., Colonel Blood, V.D., Colonel Hamersley, Chief Constable of Cheshire; Messrs. E. L. Billson, Wm. Jackson, hon. treasurer; J. A. Hassal, hon. secretary; Dr. Edgar Stevenson, Edgar Browne, Dr. Alexander, C. A. Cain, J.P., Dr. Dawson, Dr. Laird Pearson, T. D. Oakshott, Dr. Wilkinson, A. L. Rea, J.P., H. B. G. Warren, J. H. Temple, J. Royston, W. R. Jackson, A. Barker, Jerome L. Smith, C. L. Smith, Dr. E. H. Brien, Clifford Temple, &c.

The loyal toasts were duly honoured on the proposition of the Chairman. In proposing "Automobilism," he said he really did not know what England was until he became an automobilist. Districts which, seen from a train, had appeared flat, became invested with very great interest

when viewed from a motor on the highway. In this way he had been all over England and realised how attractive it was. As regarded legislation, he thought that if the Government wanted to raise more money from the automobilists a good way would be to make every manufacturer pay a tax on tyres. He desired to acknowledge to Colonel Hamersley the very fair way in which the Cheshire police treated automobilists.

Mr. A. G. Jeans, in supporting the toast, said he was very anxious that motoring should always be conducted so as not to make it unpopular. They should do their best to assist in the punishment of reckless drivers and sympathise with every rightful prosecution.

Mr. Edgar Browne proposed "The Cheshire Automobile Club," Sir Percy E. Bates, Bart., briefly acknowledging the toast.

Mr. A. L. Rea proposed "Our Guests," remarking, among other things, that motorists should be ideal hosts, to the great advantage of motoring by inviting, when occasion offered, strangers to the delights of motoring, to a drive in their cars. Having travelled over a great part of England and some parts of Scotland, he must say that Cheshire was the most fairly administered county he had been in.

Colonel Hamersley, in acknowledging the toast, agreed that automobilism had been passing through a rather stormy time, but he thought they could now see clear weather in front of them. He did not agree with policemen hiding behind hedges; he considered it a rotten system. He admitted having traps on the road, but they were long ones, extending from nine to twenty-seven or thirty miles. He had found that of 900 cars which were timed only twelve exceeded twenty-five miles an hour.

DERBY AND DISTRICT.

THE following resolution was carried by the members of the Derby and District A.C. last week:—"That the Derby and District A.C. become associated with the R.A.C. provided that that body consents to withdraw the word 'only' in Clause 18 of their scheme for association; but that, in the event of their refusal to adopt this suggestion, another meeting of the members be called to consider the position."

SOUTHEND AND DISTRICT.

WE understand that the hon. secretary of this club, Mr. A. Warnery, proposes to relinquish his position at the annual general meeting to be held at the end of next month. The committee, however, are gratified to report that Mr. H. Greenfield, captain of the club, will be able to act as his successor.

LADIES.

ON Thursday afternoon the committee of the Ladies' Automobile Club arranged for an illustrated lecture by Mr. Charles Y. Knight on "The Valveless Engine."

CHAUFFEURS.

LAST week we referred to the clubs for mechanic drivers which had been formed in Yorkshire and Kent; and now we learn that the Chauffeurs' Social and Athletic Club, with headquarters at 1A, Lancaster Gate, London, W., is proving popular. It has 120 members. Mr. R. S. Currie, the engineer to the Ladies' Automobile Club, is the president, with Mr. E. G. Evans, 76, Salusbury Road, West Kilburn, as hon. secretary. The primary object of the club is the furtherance of social intercourse between drivers in private service. The committee hope that, in time, not only drivers, but also employers will make use of its services, the latter to secure drivers of good character as well as possessed of mechanical skill. From the rules we learn that it is within the power of the committee to financially help members who are in want of assistance.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

AT the December meeting of the Executive Committee of the Cycle and Motor Trades Benevolent Fund the treasurer reported a bank balance of £1,248. Two hundred subscribers and thirty-six members were elected, of whom no fewer than eighty-three were obtained by Messrs. Brown Bros. at the Stanley Show. Applications for relief for ten subscribers were dealt with, and the accounts for the financial year ending October 31st were presented and approved for presentation to the annual general meeting.

SCOTLAND.

EXAMINATIONS for driving and mechanical proficiency certificates under the auspices of the Scottish A.C. will be held at Dundee, Aberdeen, Dumfries and Hawick this month and at Glasgow and Edinburgh during January. Information with regard to the same can be obtained from Mr. R. J. Smith, 163, West George Street, Glasgow, and it may be of interest to remind our Scottish readers that the fees for these examinations have lately been reduced.

IRISH.

AT the meeting of the committee, held on the 3rd inst., a communication from Lord Monck was considered, in which he desired that direction posts might be placed at several cross roads in County Wicklow for the convenience of tourists and other visitors. The committee decided, notwithstanding the recent imposition of speed limits through the county, on the application of the county council, and directly against the evidence adduced on the hearing, and also notwithstanding the fact that the club

is in no way liable to put up these posts, that, under the special circumstances, they should be erected.

Arrangements were considered, and directions given for the compiling of statistics for use in the event of future legislation.

The secretary reported that counsel on behalf of the club, had attended an inquiry at Naas, on the requisition of the Kildare County Council, that a speed of six miles per hour should be imposed on the two days of Punchestown Races on all motor traffic proceeding to or from the course, within a limit of two miles therefrom; and that counsel urged, on behalf of the club, that in lieu thereof regulations should be made that all traffic, including motor-cars, should on the roads referred to, when coming to or returning from the course, remain in, and not break from the line of traffic. The club desires to acknowledge the courtesy which their representatives received from the Local Government Board Inspector and the representatives of the county council, and the kindness of Mr. Wisdom Hely, one of their members, in providing his motor-car to convey the inspector over the roads, thus enabling him to ascertain in a practical manner the condition of the roads in question, and their suitability for motor traffic. The committee have every hope that their suggestion will be acted upon.

MR. J. L. MILLER has read a paper before the West of Scotland Technical College Scientific Society on "The Testing of Petrol Engines."

BEFORE the members of the Society of Experimental Engineers of Dundee Mr. W. Raikes Bell has been lecturing on motor vehicles. Mr. W. C. Keay presided, and in the subsequent discussion Messrs. Thomas Shaw, S. Watson and Alexander took part.

THE DUST TRIALS.

A MEETING open to the makers of the cars in the Dust Trials and to the entrants in the "Experimental" class was held on Friday of last week at the R.A.C. In the motor house six of the most interesting cars had been, at the Committee's request, sent for inspection, namely, the three winning cars—the Buick, Reo and Dennis—and the Stanley, Chevrolet-Walcker and Cadillac.

It was pointed out that, as long as cars were as high off the ground as the Stanley and Cadillac, there was apparently no real necessity for the underpart to be smoothly cased in, but that in lower cars, like the first two winners, a smooth under-surface was a necessity. Sketches of variously shaped and sloped under-shields were shown, which the committee had tried successively on the same car; all of them had given practically the same result. Within fairly wide limits, therefore, it appeared of no great importance what exact shape of under-shield was used, so long as it was reasonably smooth. Messrs. Dennis had, at the committee's request, ran a car with various sizes of cross petrol tanks behind, to determine roughly what could be used without bad dust effect.

On returning to the Club, suggestions and remarks were asked for regarding next year's dust meeting. With regard to date, it was mentioned that June was proposed, if possible, and if no grounds were shown against it, it was agreed that, subject to a clear week being allowed after the Scottish Trials, it would be quite suitable. The views of makers were asked as to the desirability of having two classes, and after some discussion, it was agreed that it would be desirable, the general opinion being that the division should be by tyres under 90 mm. and tyres 90 mm. and over, standard size as specified in makers' lists. A suggestion was made that, as all cars now used non-skids of some kind, they should be made obligatory on all cars. This and several suggestions for interesting tests were noted by the committee to be adopted, if feasible.

ACTION AGAINST GARAGE PROPRIETOR.

A CASE has been heard against Mr. W. Davison, proprietor of the Princess Road Garage, 137, Upper Hill Street, Liverpool, where the agency for Ariel cars is also located. This is of some interest to the trade. It was sought to secure an injunction restraining the garage proprietor from continuing an alleged nuisance owing to the arrival of the cars, blowing of horns, &c., in connection with his business. The Vice-Chancellor, in the County Court of Lancashire, has now given judgment, coming to the conclusion that there was no nuisance in respect of the action and that it was impossible for the garage to have been conducted with more consideration for the public and the neighbours. The action was dismissed with costs.

AMONG the new features of Rover cars for 1909 mention may be made of the mahogany front to the dash of the 8-h.p. vehicle. Hitherto the petrol tank has formed the dash, but the necessity for a wooden dashboard on which could be fixed various fittings, such as speedometers, &c., has been felt and has now been supplied.

THE Star Engineering Company inform us that since returning from the Show and carefully surveying the great demand they have experienced, and the anxiety they feel that the quality hitherto found in Star cars shall be maintained, they have considered it advisable to raise the prices of the 12-h.p. and 15-h.p. models to £285 and £325 respectively. In order, however, not to disappoint those who visited their stand at Olympia, this increase will not take effect until January 1st next. All orders placed before that date will be accepted at the present prices, viz., 12-h.p. £275 and 15-h.p. £300.

AERONAUTICS.

A PAPER on "Mechanical Flight" was read before the Society of Arts last week by Mr. Eric Stuart Bruce, who said this year would be memorable in aeronautical science for its demonstration of the possibility of mechanical flight. One of the fundamental principles of the recent experiments—the principle of superposed surfaces—was advanced and elucidated by a Briton, Mr. F. H. Wenham, in 1866. Two great difficulties which would have to be overcome were starting from the ground and stopping in the air. Possibly the future flying machine would consist in the combination of the aeroplane and lifting screw systems. Even in its partially developed state the aeroplane might prove to be a potent factor of war. Dr. Shaw said the issue of the contest that was going on between the dirigible balloon and the aeroplane would depend on the way they managed to accommodate themselves to the weather.

Sir Hiram Maxim said the principal feature of the Wright machine was the flexing of the corners of the wings. This device, of which so much had been said, had been patented by him eleven years ago. Up to this moment the only apparatus produced by mankind that could carry on warfare across the British Channel was a flying machine. The Wright machine, with only a very little improvement, would be a very efficient military weapon. Did anyone doubt that in case we should find ourselves at war with a continental power such machines would be used to bombard English towns?

Major Baden-Powell expressed his conviction that within the next two or three years we should all of us have experienced what it was like to fly through the air. It was of the greatest importance to England from the military point of view that we should push ahead with this subject.

At the annual anniversary meeting of the Royal Society last week an address by Lord Rayleigh was read in which he said "I cannot abstain from including in the achievements of the year the remarkable successes in mechanical flight attained by the brothers Wright, although the interest is rather social and practical than purely scientific. For many years, in fact ever since I became acquainted with the work of Penaud and Wenham, I have leaned to the opinion that flight was impossible as a feat. This question is now settled, and the tendency may perhaps be to jump too quickly to the conclusion that what can be done as a feat will soon be possible for the purposes of daily life."

MR. HERBERT CHATLEY, B.Sc. (Engineering) Lond., read a paper on Monday on "Mechanical Flight" before the Society of Engineers, in which he pointed out the revolution in ideas on this subject which has recently taken place. He proceeded to narrate briefly the theory of the subject, indicating the fallacious bases of the earlier investigations and describing the results obtained by Langley, Rayleigh, Ferber, and Lanchester. In regard to the question of stability it was shown that a gliding aeroplane is subject to two types of increasing oscillations of respectively long and short periods unless it exactly conforms to certain conditions of stability which have been given by Professor Bryan, Captain Ferber and Mr. Lanchester. The efficiency of the propeller was also referred to, the author mentioning the close analogy to the marine propeller, and quoting a formula he has devised to express the thrust and area in terms of the revolutions, diameter and power. He pointed out the effects of slip and transverse feed in which the air propeller differs somewhat from its marine prototype, and indicated the important bearing of this point on the efficiency of the helicoptère.

CAPT. W. G. WINDHAM informs us that 850 members are now associated with the Aeroplane Club, which has arranged with Mr. Henri Farman to give an exhibition of his flying machine on the 13th inst. at Chalons-sur-Marne. The Selection Committee has selected a list of fifty members from whom the election of the thirty to form the committee has just been made.

THE lecture arrangements of the Royal Institution between now and Easter include two discourses by Professor G. H. Bryan on "Aerial Flight in Theory and Practice."

ON Tuesday evening Mr. E. P. Frost, presiding at a meeting of the Aeronautical Society of Great Britain, held at the Society of Arts rooms in Adelphi, London, announced that the gold medal of the society had been offered to and accepted by the Messrs. Wright Bros.

PUBLIC SERVICES.

THE Manchester Watch Committee have renewed the licences for motor-omnibuses granted to Mr. William Stanway until the end of the financial year.

A MOTOR-BUS service has been commenced from Ilford Broadway to Turnham Green—a distance of sixteen miles.

THE motor-bus routes in London are being numbered, the first thirty numbers being reserved for motor-buses, all above that number indicating horse omnibus routes.

THE Automobile Contract Company, Ltd., of 51, Conduit Street, London, W., have issued a preliminary list dealing with the Lee-Trigwell detachable skidless band and tyre protector described and illustrated in our issue of November 14th.

THE proprietors of "Carburine" motor spirit ask us to announce that they do not give any rebate for the return of the seals from the cans in which they send out their motor spirit, but rely upon its high grade.

CASES AGAINST MOTORISTS.

THE IDENTITY OF THE DRIVER.

At the Highgate Court, Mr. W. Menzies has been summoned for refusing to disclose the name and address of the driver of his motor-car to the Yorkshire police. A sergeant belonging to the West Riding of Yorkshire constabulary gave evidence that he and two constables were timing cars through the village of Towton. They stopped one vehicle, but it was quickly off again; thereupon negotiations were opened with the Metropolitan police and the inspector called on the defendant to ask the name and address of the driver of his car when it was in Yorkshire on the day in question. No information was forthcoming, the defendant saying "you could do nothing after twenty-one days." In reply he told him the Yorkshire police were proceeding under Section 1 of the Police Act. A fine of 40s. and 10 guineas costs was imposed.

DISMISSAL.

In the Dublin Police Court, Mr. Jonathan Poole was summoned for using a motor-car at Donnybrook on the 17th of October last while the distinguishing number plate was obscured. Constable 117 E, who preferred the charge, said the car was being used to advertise a play, and a placard was placed on the back covering the number plate. Mr. E. H. Byrne (of Messrs. Byrne and Company), who defended, examined Mr. Poole, who stated that there was a ledge between the placard and the number plate and the latter was quite easily seen. Mr. Seymour, advertising agent for the company, was with witness in the car, and both of these saw that the placard did not cover the number plate. The magistrate dismissed the case.

Locomotion, Old and New, in Western Australia.

The above illustration, in which the old and new styles of locomotion in Western Australia are depicted, forms an interesting contrast. The car is a 10-12-h.p. Humbler. The owner set out land hunting from Perth, W.A., some little time ago, and after surmounting several difficulties at length reached the hut shown in the picture. This is built of gimlet wood saplings and is on the land secured by the noted Fremantle footballer, Heinrich, who is seen standing near the wheel of the cart. The other man shown is Jack Beck, an old-time cycle champion. The feat of driving the automobile over trackless stretches to this location was for some time the sole topic of conversation among the bushmen.

BATCHES

There seems to have been a lull in the wholesale capture of motorists of late. Small batches are, however, reported from Kingston (6), Arundel (3), Horsham, East Grinstead (4), and Grantham.

"POLICE CONTROLS."

THE police are exceedingly active against motorists at Coombe, near Kingston, the Portsmouth Road, Thames Ditton, the Kingston Road, Hammersmith, and also in Richmond Park.

SEVERAL traps are reported on the Great North Road, near Grantham.

MESSRS. H. M. HOBSON, LTD., of 29A, Vauxhall Bridge Road, London, S.W., inform us that they are anxious to appoint fitting agents throughout the United Kingdom for the Claudel-Hobson carburettor illustrated and described in our report of the recent Motor Show.

MESSRS. BUCK AND HICKMAN, of Whitechapel Road, London, E.C., send their general catalogue of engineers' machinery and tools, which is in two volumes, consisting of 1,000 and 500 pages respectively. The illustrations and descriptions of machines will add considerably to the value of the work for reference in engineers' establishments.

FORTHCOMING EVENTS.

DECEMBER.

- 13th (Sun.).—Closing day of the Paris Salon.
 15th (T.).—Meeting at University Buildings, Birmingham, to form a local branch of the Incorporated Institution of Automobile Engineers. Mr. B. J. A. Shaw, hon. secretary, Oaks Crescent, Wolverhampton.
 18th (F.).—Society of Road Traction Engineers' Smoking Concert at the Holborn Restaurant, London. The primary object of the concert is to afford an opportunity for a pleasant reunion of those who took part in the Commercial Vehicle Trials last year.
 3rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.
 24th.—30th.—Heavy Motor Vehicle and Aeronautical Display at Paris.

JANUARY, 1909.

- 1st (F.).—Anniversary of [the Motor Car Act, 1903, coming into operation.
 7th (Th.).—Annual Dinner of the Yorkshire A.C. at Leeds.
 8th (F.).—Nottinghamshire A.C.'s Annual Dinner.
 14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
 14th-25th.—Brussels Motor Show.
 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
 26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

- 2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.R.H. Prince Francis of Teck will be among the guests.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
 Motor-Car Show at Barcelona.

LIGHTING-UP TIME—LONDON.

COMPANY NEWS.

THE subscription list for £40,000 six per cent. convertible first mortgage debenture stock in the London Electro-Bus Co., Ltd., closed on Wednesday. From the auditors' certificate we learn that the operating profits on the company's 'buses have been at the rate of £448 per annum each. The introduction of electric bus services is under consideration at Glasgow, Cardiff, Portsmouth, Bath, Oxford, Liverpool, Sheffield, Edinburgh and York.

DE DION-BOUTON MOTOR CAB CO.—£220,000. (217,000 £1 cumulative preferred participating ordinary and 60,000 1s. deferred). To carry on the business of proprietors of motor-cabs, hackney carriages, and other conveyances, &c., and to adopt an agreement with the Parator Syndicate, Ltd. Purchase consideration, £72,423 4s. (£66,423 4s. in cash and £6,000 shares). The number of directors is to be not less than two nor more than seven. First Messrs. W. S. Leefe and J. Symmons. 250 preferred ordinary shares. Not more than £1,500 per annum, divisible. (100,484.)

THE directors of the Scottish Motor Traction have resolved to recommend a dividend for the year to September 30 last at the rate of 5 per cent., free of income-tax.

HUGHES' PATENT TYRE PROTECTOR (LTD.) is the title of a company registered with a capital of £3,000 in £1 shares. Offices have been taken at 160, Clerkenwell Road, London, E.C.

WITH a capital of £2,000 in £1 shares and offices at Bassishaw House, Basinghall Street, London, E.C., the Resilient Motor Wheel Syndicate, Limited, has just been registered.

THE Northern Automobile Company, Ltd., has held its annual meeting at Bradford. The adoption of the report and accounts was moved by Mr. John Grange, the chairman, and showed a profit equal to 11½ per cent. on the paid-up capital of the concern. The Oak Lane Garage owned by the same company is a well-known depot for motor-cabs, and we understand several additional vehicles of that type are about to be placed upon the streets of Bradford.

THE INTERNATIONAL ROTARY MOTORS, LTD., has been registered with a capital of £3,000 to turn to account certain patents for inventions relating to rotary internal combustion engines, to acquire the factory and premises at Aspley, Nottingham, and the business carried on thereat by Mr. T. H. Shaw.

ARGYLL MOTORS, LTD.—A meeting of the debenture stockholders of the Argyll Motors, Ltd., was held on Monday at the London Chamber of

Commerce. Mr. Robert Hunter presided, and called upon one of the liquidators to address the meeting. Mr. John M. Macleod said that there were three difficulties with which the liquidators had had to contend, viz., the comparatively small amount of the valuations, secondly, the large and varied interests of the different parties, and thirdly, the absence of working capital of the company. They intended that there should be a complete change in the management in the future, but those public men who would become associated with the company did not care to disclose their names until the scheme had gone through. The assets under the scheme were put on a moderate basis, and a cautious start would be made. It was not their intention or desire to strive for immediate profits. Mr. Faithful Begg (one of the trustees for the debenture holders) said that he was not himself a debenture holder. He felt that the present was a scheme which they ought to accept. He regretted at the same time that the proposals were not more favourable to the debenture holders, as they involved a considerable loss of capital. In any steps taken a very large amount of working capital would have to be found, for, at the time that the company stopped operations, there was no working capital at all. The debenture holders were asked to receive 12s. in the pound on the face value of their debentures, to be taken out in debentures of the re-constituted company. The only alternative to the passing of the scheme was a sale of the assets under the hammer. A resolution approving of the scheme submitted was carried unanimously and the liquidators were thanked for their valuable assistance to the company.

WITH a capital of £1,500 in £1 shares the Paraffin Motor Syndicate, Ltd., was registered on Friday of last week.

THE Putney, Roehampton and Wimbledon Motor Cab Company, Ltd., has been registered with a capital of £3,000 and offices at 5-6, Eccleston Place, Belgrave, S.W.

ROAD REPORTS.

SOUTHEND.—The Southend and District Motor Club is lodging an objection with the L.G.B. with regard to the application of the Borough Council for a ten mile speed limit in certain streets of Southend.

CROYDON.—An inquiry has been held into an application to impose a speed limit of ten miles an hour on motor vehicles in various parts of the town. Mr. Rees Jeffreys and Mr. G. D. Dean opposed for the M.U. and the R.A.C. respectively.

LINCOLN-GRANTHAM.—At Navenby, on the Lincoln to Grantham road, a guide post and a milestone stand within three yards of each other, but indicate differences of half a mile on the road. The guide post gives the mileage to Lincoln as 8½ and to Grantham as 16½, but the milestone declares the distances to be 16 and 8 miles, respectively.

MIDLANDS.—At the Conference, on Friday of last week, called by the Midland Association of Local Authorities, the project for constructing two new main roads between Birmingham and Wolverhampton was further examined. Mr. J. R. Cooper, the Town Clerk of Walsall, thought that the scheme submitted would cost £1,000,000, and ultimately the matter was deferred for six months, so that the local authorities concerned might go fully into the practical bearings of the scheme.

NEWHAVEN.—As a result of their inquiry on the subject, the L.G.B. have issued a regulation limiting to ten miles an hour the speed of motor-cars over that portion of the main road from Brighton to Eastbourne within the urban district of Newhaven, extending from the junction with the Lewes road to the junction with the road leading to the harbour on the east side of the railway crossing. The regulation comes into operation on the 21st inst.

RICHMOND.—At a meeting of the Richmond Town Council on Tuesday, it was resolved to apply for a restriction of the speed of motor-cars to ten miles an hour on nearly all the principal roads through Richmond, Kew, and Petersham.

BUSINESS NEWS.

THE London and Paris Exchange Motor Agency, Ltd., are experiencing an exceedingly busy time. Besides despatching large consignments of cars to New Zealand and India, they disposed last week of no less than ten vehicles in four days, ranging from a small 7-9-h.p. to a 40-h.p. six-cylinder, and this in spite of the alleged depression in trade and the time of the year.

MESSRS. GREENBERG AND SONS, of 8, Water Lane, Ludgate Hill, E.C., are the British agents for the Deutsche Celluloid Fabrik, whose specialities are celluloid cases, corrugated separators, vent pegs, &c., for use in connection with the manufacture of accumulators.

MESSRS. G. JOHNSTON AND CO., 110, Cannon Street, London, E.C., draw attention to their Rhinohyd, an improved waterproof canvas.

THE Sheffield-Simplex chassis which was exhibited at Olympia is now on view at the premises of Messrs. H. J. Mulliner and Co., 28, Brook Street, London, W.

THE Anglo-American Oil Company, Ltd., send a specimen of the silver seal which they have adopted, with the suggestion that purchasers of Pratt's motor spirit should see that when delivered the spirit is sealed with this, their recognised mark.

MR. W. T. CLIFFORD EARP, whose experience of motor-cars dates from the early years of automobile racing, has taken an office at 90, Great Portland Street, W., where he is acting as a consulting engineer and expert.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, DECEMBER 19, 1908.

[No. 511.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

NOTICE TO ADVERTISERS.

Owing to the Christmas Holidays the next issue of the "Motor Car Journal" will be published a day earlier than usual, i.e., on Thursday instead of Friday. New copy, and alterations to existing displayed advertisements, should reach us not later than Monday morning, the 21st inst. Official Notices and small prepaid advertisements can be received up to the first post on Tuesday, the 22nd inst.

COMMENTS.

Motor-car Imports and Exports.

A FURTHER marked decline took place during November last in the importation of foreign-built motor-cars and parts into this country. Of complete cars only 203 were imported during the month, of the value of £69,836. The number of chassis imported was 291, valued at £88,165, while parts were responsible for £118,092, giving a combined total for November of only £276,093, as against £367,326 in the corresponding month of last year. The gross imports of cars (3,725 in number), chassis (3,086), and parts during the first eleven months of the current year amounted, however, to only £3,895,781, as contrasted with £4,327,824 in the corresponding period a year ago. Turning now to the section relating to the exports of British automobile productions, these show a slight increase—from, in the aggregate, £124,315 in November, 1907, to £124,983 last month. Altogether 215 complete cars (£83,336) and 16 chassis (£7,261) were despatched from this country during November, as well as parts to the extent of £34,386. The gross shipments during the eleven months ending with November are returned at only £1,152,540, which contrasts with £1,216,485 in the similar period of last year.

The International Road Congress.

AN excellent summarised report of the proceedings at the first International Road Congress held at Paris this year has just been published by Messrs. Wyman and Sons, Ltd. It is edited by Mr. G. M. Harris and Mr. H. T. Wakelam, whose connection with the administrative as well as the technical side of local government gives them special authority to deal with the subject. The contents are divided into four parts, one being devoted to the account of the Congress, together with some description of its social side. The most important, however, deals with roads, this section being divided into about fifteen sub-divisions, so that matters affecting the foundation, construction, tarring, and cleansing, each find a description in its proper order. The effects of new locomotion on the roads are also dealt with, and the editors have come to the conclusion that, without in any way detracting from the value of this first Congress, it may be confidently said that the second, which will be held at Brussels in 1910, will certainly be able to effect far more than was possible on the occasion of the initial effort to bring together men who are practically interested in the subject. They also express the hope

that this country will play an important part in the development of the important questions associated with roads. The work certainly is a valuable contribution to the literature of the road, and the summaries of the various papers that were read and of the reports presented have been admirably done.

Brooklands.

ALREADY those responsible for the conduct of the Brooklands Track have announced three race meetings for next season, and now the new rules are out. New members of the Racing Club Committee are Baron de Zuylen, Mr. F. P. Armstrong and Mr. E. de Rodakowski, the latter of whom becomes a life member of all committees. The annual subscription in the future will be five guineas to all save the first three hundred members and those elected last year under the privileges granted to members of the R.A.C. Apparently from some alterations which occur in the Rules it would appear that the development of the track as a testing ground for cars will be greatly encouraged by the proprietors in the coming months.

The Value of the Car.

IN his letter on another page, Dr. Vipont Brown, of Manchester, says he does not drive a motor-car because he can afford it, but because he cannot afford to do without it. This neatly expresses the position of many motorists and serves to show that the car is not the plaything some speakers would have audiences believe it is, but that it is a practical, reliable, and necessary means of locomotion to busy men. From the motorist's point of view this fact should be strongly impressed upon all who are capable of influencing public opinion, and the formation of a Manchester branch of the Highways Protection League seems to have given good opportunity for reasonable men to enforce the opinions of the great body of motorists upon the local public.

In Scotland.

ON this subject an important gathering was held on Friday of last week, when some of the members of the Road Surveyors' Association of Scotland met the Scottish A.C. in conference. The primary object was to consider the lessons of the recent Road Congress; the real value of the meeting was the opportunity given for the interchange of views between the makers and the users of the highway. Sir J. H. A. Macdonald was in the chair and drew the attention of the surveyors to the evils of dangerous level crossings, "blind" corners, the leaving of unrolled road metal from Saturday to Monday, and similar dangers which the motorist has to risk when travelling. Mr. Robert Drummond, the president of the Association, considered that all roads in urban and populous places might be surfaced with materials treated with tar in some form without unduly increasing the expenditure. If main roads across country were surfaced up with the best metal obtainable, rolled and bound with hard material, and their surfaces kept in good condition, they would probably serve the purpose so long as neither the weight nor rate of speed were excessive. But, whatever further steps may be taken by local authorities towards strengthening and improving our roads, they might have to advise them that, unless moderation both in speed

and weight came about in motor traffic, nothing short of a bituminous binding would serve to keep in good order a macadamised surface, however good the materials, and however well it might be kept.

A Welsh Event.

ONE of the most important events of next year outside London will be the automobile tour which is being organised by the Motor Union for July next; and we would suggest to the secretaries of the various automobile clubs throughout the country the desirability of leaving the dates open so that members may participate in this interesting gathering. The Annual Congress of the Ligue Internationale des Associations Touristes will be held in England from July 7th to 18th, the sittings for discussion taking place on the first four days. They will be followed by a tour by road to Oxford, Leamington, Stratford-on-Avon, Cheltenham, and by way of the Wye Valley to Swansea—a pleasant route which should give visitors a good impression of our island and provide opportunity for that social side of motoring which has long been absent. At Swansea the Welsh A.C. will become the hosts of the party, and an attractive programme for the 15th to 18th has been arranged, including, on the 17th inst., a provincial meeting of the Motor Union.

Touring in Holland.—The Museum, Amsterdam.

A Car Census.

SOME idea of the number of motor vehicles in use has been afforded by a table compiled by the R.A.C., which shows that 154,391 automobiles had been registered in the United Kingdom up to September 30th last. At the time of the Royal Commission on motor-cars statistics were presented showing a total of 74,038 vehicles then registered, so that the aggregate number has doubled in three years—and this despite the outcry which has been raised and the threatened restriction of the rights of motorists by legislative as well as administrative action. The following comparison so far as the most recent returns are concerned is interesting:—

| | Private Motor Cars. | Motor Cycles. |
|-----------------------|---------------------|---------------|
| England and Wales ... | 63,240 | 57,472 |
| Scotland ... | 5,231 | 4,482 |
| Ireland ... | 2,910 | 3,072 |

There are in the United Kingdom 12,104 automobiles engaged in commercial work, and 5,880 employed in public service. Naturally London takes premier place in England and Wales with 34,908 registrations, with 4,777 in Middlesex, followed by Surrey and Kent—the only other counties that go above the four thousand. 3,651 vehicles have been registered at Birmingham, 3,021 at Manchester, 2,440 at Liverpool, and 1,834 at Coventry. Devonport is at the bottom of the list, having registered only eleven cars and fifteen motor-cycles. Glasgow and Edinburgh are responsible for

1,616 and 1,174 registrations respectively, and in Ireland, Dublin and Belfast head the list with 888 and 753. In only two cases throughout the United Kingdom do the returns show a falling off. This in the case of Devonport is a decline from fifty in 1905 to the figure we have already given, and at Portsmouth the number has gone from 463 in the former year to 460 in 1908.

Licence Duties.

THE new methods in connection with the payment of licence fees which will be introduced in the New Year are of considerable interest to motorists, since they bring the payments for motor-cars within the purview of the county authorities. As was explained by Alderman Scott Foster in our issue of the 5th inst., the Inland Revenue licences for carriages, motor-cars, guns, &c., which have always been paid at Post Offices, have hitherto been sent direct to the central authorities and from thence transmitted by contributions to the local authorities. Under the new conditions which will operate after January 1st the payments will still be made to the Post Offices, but will then be sent on by the local postmaster to the county council or county borough in which the particular post office is located. Thus the motorists who are aggrieved as to the policy of any district with regard to automobilism should continue to obtain their Inland Revenue licences in some other locality. The districts that have benefited from the anti-motoring attitude of their magisterial Benches need not be surprised if they lose a goodly proportion of licence fees—motorists not being willing to subscribe in two ways towards the upkeep of councils that show animus towards their work and pastime. It will be interesting to watch the development of the new policy and the effect that it may ultimately exercise on the way in which our local localities secure the administration of the Motor Car Act.

Local Authorities and the Roads.

THE new system will also enable the county and borough councils to ascertain the contributions of motorists in licence fees, registrations, and also drivers' licences towards the upkeep of the roads. We venture to suggest that the aggregate is really much greater than has generally been supposed, and the figures will demonstrate the undesirability of further agitation in the direction of taking more from those who motor. Of course, it is commonly acknowledged that roads cost more to maintain than was formerly the case; for several years the tendency was in the direction of the encouragement of railway transit and the consequent reduction of road traffic. Local authorities grew somewhat negligent of their duties and the roads required re-making in many places when the new traffic came upon them. So that it is not altogether fair to charge the heavy expenses now being incurred to the growth of the new locomotion—as is usually done at meetings of protest.

Another Deputation.

MR. ASQUITH has confessed to becoming quite accustomed to receiving deputations and the President of the Local Government Board is almost equally familiar with delegations from various associations anxious to incline his views this way or the other. Last week thirty-five M.P.'s saw him with regard to the enlargement of his powers concerning motor-car matters, and this week he has received a deputation from the Motor Union with Mr. Joynson-Hicks as the chief spokesman. They waited upon Mr. John Burns for the purpose of laying before him the views of the Union with regard to the applications of local authorities for the imposition of speed limits of ten miles an hour under the Motor Car Act, 1903, and to show cause against any extension of the powers of local authorities in this matter. The President, after hearing the statements submitted to him by various members of the deputation, promised to give them his careful consideration—practically the same reply that was given the earlier deputation of his Parliamentary colleagues.

Motor Cab Service.

SOME interesting and curious comparisons are being made showing variations in the registrations of fares by motor taxicabs. A correspondent who hired a cab from Waterloo Station to Upper Hamilton Terrace, N.W., on one occasion was charged 3s. 4d., and on another day the dial registered 1s. 10d. A further case shows a difference of 2s. in the registration on separate occasions, and suggests that those responsible for the organisation of the motor-cab services will have to give attention to this matter to secure something like accuracy on every occasion if the public is to have confidence in the mechanical devices supplied.

Aerial Navigators.

AN important point raised by the Duke of Argyll in his speech at the annual dinner of the Aero Club should not be overlooked by those who are interested in the future of aviation. In the early days of motoring, both private and in public service, difficulties often arose in getting able men trained in the handling of these machines. These will also appear when the question of rising from the ground into the air becomes more

to over-rule the disposition for the most perfect form of ambulance service.

The Provincial Clubs.

SEVERAL annual meetings of the provincial clubs have lately been held, at which most satisfactory reports and balance-sheets have been presented. Altogether the various local motoring organisations seem to be in a very healthy condition, and, although there is nothing like unanimity with regard to the question of affiliation to the central bodies, substantial progress has been made in securing the adhesion of motorists to the county organisations.

Haywards Heath again.

AT Haywards Heath, on Monday, nineteen motorists were concerned in twenty-four summonses, mainly for exceeding the legal limit on the London to Brighton road. Altogether the fines and costs for the day came to a total of no less than £234, this aggregate being considerably helped by four defendants having each to answer two cases on one day for the outward and home-

A Reminiscence of the Prince of Wales' Visit to Canada in July last.—His Royal Highness sight-seeing in Quebec on a Comet Car placed at his disposal by the Comet Motor Company, Ltd., of Montreal.

Quebec is a very hilly city, being built on a rock; one of the main roads traversed by the Prince of Wales was from the Wharf to the Citadel, a climb of 600 feet in less than a mile; notwithstanding the steep ascent the vehicle made the journey without a falter.

generally realisable. The Aero Club and other organisations that are concerning themselves with the subject will do well not to forget the warning of the Duke of Argyll and give opportunities for the encouragement of men offering themselves for training in matters of aerial navigation.

Motor Ambulances.

SOME discussion is likely to take place with regard to the policy of the Metropolitan Asylums Board in connection with the building of the new motor ambulance it intends to put into service at no distant date. The bodies of the new vehicles are to be placed upon cab chassis, and the point is whether it would not have been better to have had the whole ambulance specially designed so as to secure the minimum of vibration and the maximum of comfort for the unfortunate people who may be served by the ambulance. Of course the education of public bodies is a long process, and it required much investigation of the cars on view at one of the motor shows at the Agricultural Hall to convince the members of the Asylums Board that the motor ambulance was really a reliable vehicle. Now that they have had ample evidence of that fact they should not allow a notion of economy

ward journeys. One of the motorists was fined £30 and costs, his licence ordered to be suspended, and he was disqualified from driving for two years. Such heavy hauls have not been so frequent of late, the bad weather generally experienced having led to a lull. The reward of police watchfulness.

Short Stories.

IN our next issue we shall announce an interesting competition open to readers of the *M.C.J.* who have had interesting experiences when on their motor trials and can weave the same into a Short Story of automobile interest. Stories of from 1,000 to 1,200 words will be welcomed, and the occasion will present a good opportunity for motorists with literary ability to exercise their skill.

THE 1909 15-h.p. White steam car chassis which was at Olympia will spend Christmas and the New Year at the showrooms of the White Company, Albion Street, Gaythorn, Manchester. This first appearance of the new White model in Lancashire should be of interest to our northern readers, who have hitherto only known its merits from the Press.

INCIDENTS OF A RUN TO FOLKESTONE AND DOVER.

AS an objective to a run Dover is interesting. Apart from the international flavour of the place, or rather the people one meets there, quite a lot is to be seen, including the wonderful extensions to the Admiralty harbour. At Dover one comes across hotels, streets, and even private houses, adorned with French names. One can pull up at a French hotel, and partake of genuine French drinks in an atmosphere of French, by which I do not mean to suggest that Dover is in the least smelly, as is the average French port and harbour place. Last, but not least, I would not omit to mention that a genuine and extended view of the French coast is thrown in gratis, and it is quite the best

The Folkestone Road at Leeds.

The road is bounded with cool shady woods, it being a favourite motoring picnic venue. On the right, through the screen of woodland, a view of Leeds Castle and moat is obtained.

obtainable from any road in this country. Luckily there were no fogs on the Sunday that we patronised the town. The chalk cliffs and fields the other side appeared so near that the passenger seriously thought of swimming across.

The A.A., always thoughtful, advises motorists to steer clear of the direct road down. We knew it of old, so the advice was unnecessary. The A.A. suggests an alternative route by way of Eltham, Wrotham and Maidstone, but, not liking the lumpy macadam to as far as Sidcup, we choose the best route, *via* Sevenoaks, which joins the approved route at Borough Green. As far as Polhill we had the usual Sunday accompaniment of cyclists, brakes, &c., but, turning off the Sevenoaks road at Riverhead, we left much of the traffic behind. At Wrotham we struck the tarring, and also nearly struck the left hand bank in taking the very sharp and most awkward turn out of the village.

The Maidstone road is far too interesting to rush over, despite the inducements to speed. Foreigners, particularly Americans, are never tired of praising the splendid scenery; dotted on either side are charming old-world villages and finely wooded country. After Maidstone the road, if anything, increases in interest. Perhaps the most picturesque stretch is at Leeds, where the road runs through the woods of that name. On the right a view is obtainable of Leeds Castle and moat. After the village of Harrietsham the road narrows somewhat into Lenham, a singularly quaint old-world village. Hitherto it was a very loose stretch from here to Charing, but tarring has improved the road out of recognition. The old Swan Hotel, that faces you on entering the village, bears the modern name on a swinging board "The Automobile House." The proprietor stocks petrol and oils and is quite up to the times. Running into the yard at the side, we were soon discussing dinner in an old-fashioned room with big bay windows overlooking the

road. Cars were continually passing in either direction; indeed the place seemed given over to automobiles.

From Charing to Ashford is another fine stretch, and mostly tarred and just sufficiently undulating to be interesting. Most inviting bye-roads branch off on either side to Tenterden and many other places right off the beaten motor track. The final stage of the run to Folkestone sustains the general interest. The steeplechase course at Westerhanger runs parallel to the road and is only used three or four times a year. One gets the freshening sea breeze in descending the long slope into Hythe, past the barracks. Thence along the fine tarred front to Sandgate, which is being rapidly opened up with hotels and private houses. Several of the Thames six-cylinder char-a-bancs were noticed; these run to Dymchurch, &c., and, the weather being fine, they were well patronised. The curious three-horsed trams at this place afford a striking contrast.

Folkestone presented a summery aspect, the Lees being thronged with visitors. In the harbour the turbine boat was seen getting up steam for the afternoon passage. There was quite a lot to see, including some members of a French band from Dunkirk. Leaving the town by the Dover road, we were confronted with the climb up Folkestone Hill, over a mile long and an ideal seaside venue for a hill contest. A motor-cyclist on a powerful machine sped past on the initial portion, but we came on him again at the first bend with the engine stopped and a look of disappointment on his face that betokened failure. It is really a stiff pull, with two bends. However, our car went up like a bird and glided into top speed as soon as the easier gradient was struck. From the summit there was a clear and extended view of the French coast, the cliffs and fields being quite discernible. The road skirts the cliffs for some three-quarters of a mile, and is the nearest road point to France.

There is a four mile drop into Dover, and at the outskirts and tram terminus prominent boards request motorists to drive slowly. What particularly attracted our attention were several modern villas lining the road, each with some French name. For instance, one on the right was called "Mon Repos." It hardly struck us as being a particularly restful spot, with the trams, to say nothing of motor-vehicles, and the adjoining railway station. We ran on to the Esplanade, where there was really a lot to see; the fine smooth road is not cut up by tramlines, and the wonderful extension that has been made to the National

Charing—the "Crawley" of the Folkestone Road. The old Swan Inn displays the modern signboard, "The Automobile House."

Harbour—one wall extending three-quarters of a mile out to sea—was noted. After doing the Esplanade we run along the harbour road, where one sees "On parle Francais" on several hotels and shops. We pulled up at the Hotel de Paris and entering, duly made obeisance to the lady at the counter. "Qu'est-ce que vous voulez?" asked the passenger. We elected café-cognacs; thereafter we lit up French cigarettes of the genuine brand. Several French lady and gentlemen visitors were in the place and it was really most interesting. In fancy, we imagined

ourselves *en tour* in France, partaking of refreshment at a café at some quaint old-world port. Little did we think how soon and speedily the illusion would be shattered! After starting up and rounding a sharp bend of the road the bonnet touched the barrow of a local wheel hawker, who immediately assailed us in unprintable Doverese.

The London road out of the town follows the tram lines by a twisty route, but, after the outskirts had been left behind, we struck tarred road again, and the surroundings are interesting. Lydden, an old-world village, was passed, and a few miles further the road ran parallel with Barham Downs, where, as most people know, an army was maintained for the especial reception of Napoleon's "Army of England" that was gathered at Boulogne for the invasion that was "scratched." The Downs extend for miles, and there is a wonderful view across the valley to the hilly country to the south-west. The road continued in splendid trim to Bridge, which of late has come into some notoriety through its police traps. It is certainly a very inviting bit, nicely tarred and much resembling a French highway to Canterbury, the spire of the Cathedral and the town itself as viewed from the distance being not unlike Chartres. It was too interesting to rush over, so we drifted along quietly into the Cathedral city, where it was decided to follow the Charing and Maidstone road home; this is an additional ten miles, but the detour is worth it.

After Chartham another little detour was made to visit Chilham. The approach is pretty enough, but the village, with its quaint old houses and church, is simply enchanting. It has the distinction with Chiddingstone of being the prettiest village in England, and the title is deserved. The church, church house, schools, forge, &c., in a cluster, and one of the quaintest old inns, all free from any suspicion of modernity, render the place a veritable picture. Not a sign of human life was to be seen that Sunday afternoon, and we felt like intruders in the place; indeed, the presence of the car seemed totally out of place. A sharp descent from the village led into the Charing road again. From this point to Charing hill the road has been tarred, converting what was formerly a loose and flinty stretch into splendid smooth going. The outward route was joined at Charing and several motors were seen at this village. At Malling the number of the car was noted by a policeman, this being part of the new move of the Kent police to check reckless driving, though in our instance it was unnecessary, as the vehicle was being driven with the throttle cut very fine, the Maidstone road being unsuitable for speed at holiday time. Home was reached without any incident worth recording so far as the car was concerned, and, thanks to the tarred roads, there was no dust to speak of either on the vehicle or ourselves. The total run worked out at about 160 miles and was interesting every mile.

C. F.

MESSRS. SHARP, WILLIAMS AND SHARP is the title of a new firm of automobile engineers which has been established, with offices at Carlton House, Regent's Street, London, S.W., and works at 20, Danvers Street, Chelsea, S.W. The first and third name in the combination are those of gentlemen who have been associated with the motor trade in connection with the Reo car, and their experience will materially assist the firm in obtaining a good position for itself. Their repair works are within a few minutes' walk of Sloane Square Station, and arrangements have been made for the acceptance of cars at their West End offices, where estimates can be given for the execution of the work in the engineering shops. An innovation is suggested in the three months' guarantee which the firm intend to give for all repairs executed by them. One branch of the business will be devoted to the fitting of glass screens, luggage carriers, hoods, and other accessories, and a speciality will be made of the lengthening of chassis and fitting of side entrance bodies, thus bringing cars of older date into line with modern fashion. A large stock of spare parts is kept, as well as tyres of every make, detachable rims, &c. Altogether Messrs. Sharp, Williams and Sharp are well equipped for dealing with repairs of all kinds and supplying spare parts and accessories of every variety.

THE MALLINS ENGINE STARTING DEVICE.

WE are able to illustrate this week the simple and ingenious method of starting the petrol engines of motor-cars from the driver's seat which has been devised by Mr. C. W. Mallins, A.I.E.E., the general manager of the Liverpool Corporation Tramways. As will be seen from Fig. 1, which shows the arrangement in plan, on the starting handle shaft A is fixed a pulley B, around the groove of which is laid one complete turn of a flexible wire cable, the end being fast to the pulley. The other end passes over a small pulley C attached to one end of a lever D, and then inside the bonnet and through the dashboard, terminating in a hand grip or stirrup J fixed at a convenient height for the driver to operate with the right hand. The pulley B is controlled by a spring G, one end being fast to the pulley and the other to some stationary part such as the bracket F. This spring always tends to wind the cable on the pulley after each operation, and also holds the couplings in the normal out-of-action position, thus performing the two operations, viz., rewinding the cable on the pulley and holding the couplings H and H' apart.

To start the engine the driver pulls the grip J sharply towards him; this pull, due to the cable passing around the small pulley C, swings over the lever D (which is pivoted at E). The latter abuts through suitable bearings against the starting shaft at the point K, compressing the spring G, and bringing the coupling H into mesh with the coupling H' on the engine crankshaft. The

Figs 1 and 2.

continued pull revolves the pulley B, and transmits through the couplings H and H' the initial movement or revolution to the engine.

The destructive effect of a back fire or premature explosion is guarded against by the addition of a pawl and crown cam on the starting shaft to throw the couplings out of mesh. In the operation of starting the engine, simultaneously with the couplings coming into gear, the crown cam L (Fig. 2) on the starting shaft A is brought into mesh with a round nosed pawl M, attached to the bracket N. When the starting shaft is rotated by pulling the cable the pawl slips over the teeth; should a back fire occur, and the crank shaft P be rotated in the opposite direction, the pawl M is locked against the stop O, and, due to the formation of the nose of the pawl and teeth of the crown cam, the starting shaft A is forced outwards and consequently the couplings H and H' separated.

The device, which is not only inexpensive but does not prevent the use of the ordinary starting handle, has proved so effective in practice that it has been decided by the Tramways and Electric Power and Lighting Committee to fit it to all the motor-cars in the service of the Liverpool Corporation.

THE "Douche Pneu," illustrated in our issue of the 5th inst., is the invention of Messrs. Mariotti and Tzaut, 10, Rue d'Alger, Paris, from whom full particulars of the arrangement can be obtained.

CONTINENTAL NOTES.

Touring Facilities in France.

The Motor Union's association with the Ligue Internationale des Associations des Touristes is enabling it to provide with increasing efficiency for the wants of British motorists touring on the Continent. With the assistance of the French Touring Club, thoroughly efficient repairers have been appointed in fifteen selected towns. Rather than entrust their cars in a serious breakdown to the nearest mechanic, of whose capabilities and resources they know nothing, motorists will now be able to place their car on the railway for conveyance to an establishment whose equipment both as regards machinery and skilled workmen will ensure that the biggest *panne* will be repaired successfully in a few days. The centres selected are Nantes, Caen, Rouen, Lille, Nancy, Orleans, Tours, Nice, Grenoble, Marseilles, Lyons, Bordeaux, Pau, Toulouse, and Clermont-Ferrand.

International Road Signs.

At a recent meeting of delegates of national automobile clubs and touring associations in Europe and America, held in

Paris, the resolution adopted at the International Road Congress with regard to the adoption of a standard system of road signs was considered. At the last mentioned congress it was decided that the number of signs to be used should be four in number, denoting respectively obstacles on the road, bad turns, level crossings, and dangerous crossings. After discussion, the meeting resolved to adopt the four proposed signs which are shown in the accompanying illustrations. As will be seen, each sign consists of a circular plate bearing a legible device requiring no further written explanation. The groundwork of the sign will be dark blue, with the indication in white. In countries where the authorities object to a round sign liberty is allowed to employ a rectangular form. Practically these signs are the same as were adopted by the Association Générale Automobile, an offshoot of the Automobile Club of France, several years ago; the discs will be 18½ in. in diameter, and fixed at a height of 9 ft. above the ground.

The A.C.F. Grand Prix Races for Heavy and Light Cars.

As a result of the movement against a continuance of the Grand Prix race it seems doubtful if this great international event will be held in 1909. The Sporting Commission of the A.C.F., at its meeting, after having received the deputation from the Anjou Committee, decided, however, to open the entry list. The amount of the entry fee is fixed at £200 for one vehicle, £360 for two, and £480 for three cars. The entries will close on the 31st inst., at 6 p.m. No entries will be received at double fees, and unless forty entries are received the race will not take place. The Grand Prix des

Voiturettes being subordinate to the heavy car race, entries for the former will only be received after the closing of the list for the Grand Prix, and only then if forty entries for the latter have been received. Up to the time of writing only three entries had been received—those of Messrs. Cottin and Desgouttes, of Lyons.

A Good Word for British Cars.

Writing in the "Automobile," M. Henri Baretta, in referring to the fact that the Siddeley was the only British built motor-car on view at the Paris Salon, remarks that in his opinion "it is the equal of our best."

A Competition of Tyre Inflating Devices.

Twenty-five entries were received for the competition of tyre-inflating devices which was held by the Automobile Club of France on the 7th and 8th inst. The tests were carried out on a set of four 935 mm. by 135 mm. tyres; in the category for devices not using a storage reservoir the first prize (£20) was awarded to the Auto-Gonfleur of the Aster Company, the second prize (£12) to the Select apparatus of M. Munili, and the third prize (£10) to the Delpuch device of the Comptoir d'Innovations-pour Automobiles. In the section for inflators using a reservoir M. Saurer carried off the first prize and Messrs. Grouvelle and Arquembourg the second.

Aeronautical News.

The Ligue Nationale Aérienne has received several new prizes to be offered for competition by aviators.—The Mayor of Lannemezan (Haute Garonne) is offering a large area of land as a practising ground for flying machines to the Ligue Meridionale Aérienne.—The parliamentary group for the promotion of aerial navigation has decided to move in the Chamber that an International Aerial Locomotion Exhibition be held in 1910.—A Brussels newspaper is offering a prize of £400 to the first aviator who shall fly from Brussels to Ostend and back between August 15th and September 15th next year. The competitors will be allowed to come to earth at four different points *en route*.—At Anvours, on Wednesday last week, Mr. Wilbur Wright took several members of the Aero Club of Great Britain for trips in his aeroplane.—Some trials are being made at Sanvic (Seine Inferieure) with a new aeroplane designed by M. L. Hervieux.—The German Aerostation Company is the name of a concern which has just been formed in Frankfort on-Main for the establishment of a passenger service in the air between twenty-six German towns. Seven special airships, capable of carrying ten to fifteen passengers, and of travelling in all weathers, have, it is stated, been ordered.—It is proposed to establish stations on the roofs of large hotels at Frankfort, Cologne, Nuremberg, Munich, Hamburg, Mayence, Cassel, Stuttgart, Mannheim, Strasbourg, Hanover, Dresden, Leipsic, Kiel, and also at Copenhagen.

Miscellaneous Items.

La Compagnie Générale de Taximètres-Automobiles is the name of a company which has just been formed in Brussels.—The municipal authorities of Liège, Belgium, have just invited offers for the concession for the running of motor-cabs in the town during the next three years.

Rien à Déclarer.

Les aéroplanes deviennent officiellement des "planeurs." C'est du moins ainsi que les désigne un document administratif qui fait en ce moment le tour des bureaux de l'octroi. Car l'octroi s'est ému—déjà!—des fraudes que pourraient favoriser les "planeurs" passant les fortifications, sinon à la barbe, du moins à quelques dizaines de mètres au dessus de la barbe des bon "gabelous." Il n'y avait qu'un moyen d'obvier à ce danger fiscal, c'était de charger éventuellement les agents de M. Lépine de surveiller les atterrissages des dirigeables ou des "planeurs" dans Paris. Ainsi sera-t-il fait, nous a-t-on dit à l'octroi. Mais la mesure n'est encore que provisoire.

GOSSIP FROM PARIS.

The A.C.F. Grand Prix Race.

Le Roi est mort! Vive le Roi! The Motor Grand Prix is dead! Long Live the Aviators' Grand Prix! It is useless for the French automobile makers to pretend that the decisive reason for boycotting the Grand Prix was the cost and the perturbation it created in the factories. Underlying all their protestations and arguments was the admission that the general public no longer care much to see motor-cars travelling at even 150 kilometres an hour. What is witnessed every day on a frequented high road produces an almost equally intense impression. In any case the manufacturers of automobiles are conscious that their racing cars cannot compete successfully with the aeroplanes in drawing the public. The confession was made to me last week before the Sporting Committee of the A.C.F. had decided the Grand Prix of 1909 should be suppressed unless at least fourteen manufacturers should have the moral courage to class themselves among the "small fry" by entering three cars each before the 31st inst. For the maintenance of the race the total entries must amount to at least forty cars. I say class themselves among the "small fry," because almost all the big firms, that is to say, seventeen of them, signed the engagement to boycott the race. They were Benz, Berliet, Léon Bollée, Brasier, Clément-Bayard, Darracq, Delaunay-Belleville, Germain, Isotta-Fraschini, Lorraine-Dietrich, Mercedes, Minerva, Motobloc, Panhard-Levassor, Peugeot, Pipe, and Renault. I have placed the names in alphabetical order, but from the point of view of initiative in the boycotting the last should be first and the first last. Of course, the suppression of the Grand Prix would entail that of the Grand Prix des Voiturettes.

Efforts to Secure its Continuance.

The Marquis de Dion being, however, convinced of the advantages the French automobile industry would continue to derive from the maintenance of the Grand Prix, is persevering in his efforts to find a compromise. He hopes to get the Sporting Committee of the A.C.F. to reduce the minimum number of cars from forty to thirty, and to accept the organisation of the race even with a smaller number of entries, provided the local committee of the Anjou circuit makes good the deficit in the fees. This arrangement would be only fair, as that committee has, on the invitation of the A.C.F., been working hard for more than a year, especially since last July, and spending large sums of money, to secure the advantage of the race being run in its district. The members of that committee are in any case determined to do their utmost not to lose all the fruit of their labour, and will at the last emergency endeavour to organise an International automobile competition on their own account. Their persevering efforts deserve success.

The Cost of Racing.

The acceptance of M. de Dion's suggested compromise or the organisation of a great international race by the Anjou committee will make no difference to the position of the seventeen firms which have signed the engagement to boycott all races in France during the coming year. They cannot enter a single car for a speed competition without having to forfeit £4,000. That being the case, it is to be hoped they will keep their promises and occupy their enforced leisure by working at the wonderful improvements they say they have till now been prevented from perfecting by their racing preoccupations. Most certainly motor-cars are not so perfect as they might be and also they are too dear. To content their customers and to insure at the same time their own continued prosperity, the manufacturers must, while improving their vehicles, also reduce their prices. And that by their own showing will evidently be possible. A couple of weeks ago the managing director of an automobile firm told a friend of mine that the participation in races had cost him so much that to recoup the amount he had been obliged to add £20 to the price of each car he sold.

The Paris Show Question.

La Barbe is a very forcible bit of French slang summing up in two words "Hold your tongue, that is too great a bore." It

was used very often last week in the Grand Palais, where the initiators of the campaign for the transformation of the annual Salon into a biennial show were busy seeking adhesions to their proposal. For the time being, at least, the majority of the exhibitors did not care to consider it. They had enough to do to think of the show which closed its doors last Sunday. What they will do now I cannot say, but if only the second section of the Salon, that is to say the exhibition of the commercial and industrial vehicles, machinery, motor-boats, and flying machines, to be held from the 24th to 30th inst., proves as successful from a business point of view as the show of automobiles did, the partisans of the suppression will have considerable difficulty to obtain anything like unanimity in support of their idea. It may be undeniable that some of the leading automobile manufacturers did not obtain so many orders at the Salon as they had done on previous occasions. That diminution may, I think, be attributed to the fact that the general public, who are buying more motor-cars every year, have rightly or wrongly come to the conclusion that there are at the present moment a great many comparatively small makers turning out moderate-powered cars which can bear comparison with those bearing the names of big manufacturers, and which can be had for a comparatively low price. At any rate, the small fry are not dissatisfied with the result of this

The Clement-Bayard Airship in its shed, showing the propeller and planes.

This successful airship, which is driven by a 120-h.p. Clement Bayard engine, is owned by M. A. Clement, a vice-chairman of Clement-Talbot, Ltd. The car measures some 88 ft. in length, 5 ft. wide and 5 feet high.

year's show. It has, on the whole, been a more "business show" than some of its predecessors, but the business has not been done exclusively by the princes of the automobile industry. The rising generation, if the expression be permissible, has had its share.

MARNEY.

IN our issue of July 25th last we fully described the valuable features of the Torkington tyre, which promises to become a really practical means to automobile economy. Those who are interested in this solid tyre, the segmental construction of which practically secures its admission to the category of cushion tyres, will be pleased to learn that the Torkington Tyre Company are now established at Percy Street, Tottenham Court Road, London, W.C., where we recently saw their staff busily engaged in the conversion of wheels to take the tyre. Many owners who have previously depended on pneumatic tyres are considering the merits of the Torkington solid tyre, and we were particularly impressed with the fact that a powerful Daimler was being thus fitted previously to being employed on a long tour, including a journey over the Italian Alps. This should, at this season of the year, provide a splendid test of the tyre as a non-skid. It certainly reveals the confidence of a practical motorist in the device.

THE SOCIAL WHIRL.

THE forthcoming dinner of the clubs associated with the R.A.C., to be held at the Hotel Cecil on the 14th prox., will be an important social event. An innovation in automobile dinners will be made in the arrangement of the tables, the usual "top table" being done away with, and a series of small tables being set in order to promote the sociability of the guests. Ladies will be invited, and Prince Francis of Teck will preside.

VISCOUNT GERAWLY, who succeeds to the earldom of Annesley, is an enthusiastic motorist and acted as amateur mechanic to Mr. Tom Thornycroft in the "Four-Inch" race this year. The Irish estates of the Earl of Annesley, where Lord Annesley died on Tuesday, are at Castlewellan, Co. Down, and were the scene of the speed trials that followed the Gordon Bennett race in 1903.

ONE of the obvious facts to be gleaned from the Motor Show recently was the quieter tone of much of the carriage work as compared with that of a few years ago. Not only was this

evidence of means as well as suitability of character has been shown.

MR. HARVEY DU CROS is organising a Marathon Race to be run in Hastings shortly, the idea in view being to draw attention to the town of Hastings as a health resort in the winter months.

As General Smith-Dorrien was motoring from the West End of London to a country place in Essex, a few days ago, he had to slow down when in the Whitechapel Road, London, E., owing to the traffic. Whilst thus delayed a small boy jumped on to the luggage-rack at the rear, and, when the vehicle got into its proper stride, the youngster was too scared to jump off. Thus he rode to Ongar, 23 miles away, without the General being aware of his presence.

DURING the hearing in the King's Bench Division of an action which arose out of the death of a pet dog, killed by a motor-car on Wimbledon Common, a plan of the place where the accident happened was put in by the defence, and Mr. Horace Avory, K.C.,

Speed Trials at Brooklands.—Hieronymus and the Laurin-Klement Car on which he last week attained a speed of over 73 miles per hour.

apparent in the Annexe, where some splendid types of motor bodies were on view, but the tendency was also evidenced in the Gallery, where firms supplying fittings which were originally of brass are now giving attention to oxydised metal, this duller tone coming into greater favour.

THE Chancellor of the Exchequer has informed Mr. Cooper, M.P., that the number of licences issued for motors or vehicles drawn by motors for 1907 was 40,902, and for hackney motors 14,666. These figures exclude motor-bicycles and tricycles.

MR. C. Z. BOOTH, whose motor-car was concerned in an accident near Hatherly recently, is a son of the Right Hon. Charles Booth, whose work in connection with the "Life and Labour of the People" has set a standard for investigators of social affairs.

THE Senate of the University of Cambridge has agreed to the regulations proposed by the Proctorial Syndicate for the more effective control of undergraduate motorists. Now those who wish to keep cars will have to obtain permission from their college tutors and the senior proctor; and that will not be granted until

produced a little china model of a dog, which he asked a witness to show him where to place on the plan. This having been done, Mr. Avory next produced a toy motor-car, and with it the witness, amid laughter, gave a graphic illustration of the car coming quietly along the road, and then suddenly swooping into the ditch, with the object (as one side alleged and the other denied) of running over the dog.

It is some years since I met the Hon. Leopold Canning, J.P., who has just returned from a tour in France, where he covered 4,000 miles with no mishaps beyond a couple of punctures. The inconvenience of these, however, was in a great degree mitigated by the fact that he had wisely adopted the Stepney spare wheel. In the early days of motoring Mr. Canning was identified with the motor-cycle, and during the time of the Gordon Bennett Race in Ireland was one of its leading devotees.

LOLLIUS.

THREE White steam patrol wagons have recently been supplied for Government service in Rio de Janeiro, Brazil.

It is reported that an electric taxi-cab is being built in the works of Mr. Thos. E. Edison, at Orange, N.J., U.S.A.

TROUBLE is arising among the motor cabmen of London owing to the system of the compulsory payment of sixpence a day against third party risks.

THE only car with a three-cylinder engine to be seen at the recent Paris Salon was a 10-h.p. chassis intended for motor-cab work, exhibited by the Brixia Züst Company.

A 20-H.P. Balachowsky-Caire petrol-electric motor-car recently made a successful journey from Paris to Milan, an average speed of about twenty-five miles an hour being maintained.

THE New Zealand Government is running a public service of four Albion twelve-seated cars between Culverden and Hamner and back, a distance of forty-eight miles, for the benefit of tourists.

WE understand that a company known as the Silent Change Gear Company has been formed with a capital of £50,000 to introduce the Fouillaron system of variable speed gear, by means of expanding and contracting pulleys, into this country.

ACCORDING to the London correspondent of the "Manchester Guardian" there is reason to believe that certain investigations are being made by the Treasury, with the knowledge and assistance of prominent men in the motor industry, with the object of ascertaining whether a duty on petrol is feasible.

THE first establishment in America for the sale of airships has just been opened in the Broadway, New York, by a motor-car firm. The prices vary according to capacity, the minimum being £20,000, for which an airship can be bought which will carry eight persons, including the pilot and engineer. The guaranteed speed is thirty miles an hour.

SEVERAL of the leading electrical concerns in Germany, such as the General Electric Company and Siemens and Halske, have for some years had the ambition to enter the motor-car trade, but the idea has hitherto not got beyond the experimental stage. At last, however, the Siemens-Schuckert Company have definitely taken the plunge, having taken over the Protos Motor Works, in Berlin.

MR. J. GORDON BENNETT has offered the Aero Club de France a cup of the value of £500 to be competed for next year in France under the auspices of the International Aeronautic Federation and of the French Society for the Encouragement of Aerial Locomotion. Besides this cup, Mr. Gordon Bennett offers three sums of £1,000 to be awarded to the winner of each of the first three annual competitions.

THE Coventry Chain Company, Ltd., send us a copy of their new catalogue. The list gives full particulars of the Standard and Wormo chains, together with the dimensions of the many sizes now being turned out. Particulars are also given of chains suitable for driving small pumps and magnetos, as also of the Coventry chain wheels and chain wheel cutters and of the Coventry Noiseless chains, the latter being one of the company's latest productions. A usual feature of the catalogue is the table giving a list of the principal chain-driven cars at present on the market, together with the number of the chain suitable for the same.

ON Friday, last week, we had an opportunity of going over the extensive new premises which have just been opened in Store Street, Tottenham Court Road, London, by Messrs. McCurd, Ltd., the well-known dealers in second-hand cars. Including the basement, in which provision is being made for effecting motor-car repairs, there are altogether five large floors available for the storage of automobiles, the total capacity being upwards of one hundred cars. Half of the first floor is being devoted to the offices and to a large showroom for motor-car accessories. An hydraulic lift has been installed, by means of which vehicles can be quickly transported to and from any of the floors. Mr. McCurd, who is nothing if not up to-date, finally took us up to the roof of the building to see, as he put it, his landing place for aeroplanes, but which we may mention is for the present being used for the cleaning down of vehicles. Altogether, the new premises are well adapted for the company's business, and, being splendidly situated, should become a popular resort for all seeking a reliable second-hand car. The work of removal from the old premises in Euston Road, N.W., is not yet quite complete, but already there is a very wide selection of vehicles on hand.

HERE AND THERE.

UNDER the auspices of the Board of Education four lectures on the automobile have just been delivered at the Public Library at Brooklyn, U.S.A.

THE Board of Trade is in communication with the Cheshire Lines committee in regard to the means adopted for protecting the level crossing at Northwich.

A PRISON motor-van has been supplied to the borough of Tynemouth by Messrs. Taylor, Dunford and Company, of Newcastle-on-Tyne.

SPRINGFIELD, Mass., claims the distinction of having the only Chinese laundryman motor-cyclist in America. Chin Yep, a progressive Mongolian of that city, has purchased a carrier motor-cycle to facilitate the delivery of clean collars, cuffs and other articles of wearing apparel that have been entrusted to his care.

IN case of fire the following, according to a Chauffeur's Vade Mecum issued by the Ocean Accident and Guarantee Corporation, Ltd., may be used always at the seat of the fire, i.e., where the petrol (if the cause of the fire) is flowing:—A bottle of Bass may be broken over the flames, or a syphon of soda, lemonade, potash, or any mineral water, or sand or flour, may be used to advantage. A syphon is preferable, as the valve allows it to be used as a hose.

The Stand of the Palmer Tyre Company at the Paris Salon.

"LE PROBLEME DE L'AVIATION" is the title of a book which has lately been published by M. Ch. Delagrave, Paris (15, Rue Soufflot). The book is practically a reprint of the address given a few months ago by M. Armengaud, jun., at the French Conservatoire Nationale des Arts et Metiers, and deals very thoroughly with the present condition of the heavier-than-air type of flying machine. The book is well illustrated, and should prove of service to all who are interested in the great developments that are taking place in aerial flight.

THE old idea of an *avant train* or motor fore-carriage which can be applied to any horse-drawn carriage, by substituting it for the front wheels of the latter, and so converting it into an automobile, has been revived by the Société des Avants-Trains "Fram," of Paris (10, Rue Lafitte) who exhibited the same at the Paris Salon. The fore carriage is provided with two electric motors, each driving through gearing one of the road wheels; the frame to which the front axle is attached also forms the support for the chest containing the battery of electrical accumulators, one charge of which is sufficient for a run of from 35 to 40 miles. The company claim that one of their *avant trains* can be utilised in connection with a victoria, coupé, or landaulet, the time occupied in detaching it from the one vehicle and attaching it to the other being but little more than is taken up in transferring a horse from one pair of shafts to another.

At the annual meeting of the Highways Protection League, Lord Willoughby de Broke said that seventy villages had requested the Warwickshire County Council to apply for limitations of motor speed to the rate of ten miles an hour, but they had all been refused. Other speakers included Sir Luke White, M.P., Sir Henry Craik, M.P., Mr. J. Cathcart Wason, M.P., and Mr. Harold Cox, M.P.

AN American firm, Messrs. Cisler and Serson, 3,111, Michigan Avenue, Chicago, has recently brought out what is termed a waterproof, coldproof, flexible cap made to fit snugly over the front of the radiator of motor-cars, it being held in place by a snap fastener on either side. The cap is designed to be used in cold weather to keep the water in the cooling system from freezing when the car is standing. Because of its snug fit it is claimed that the hood or cap is much more efficient than the blanket generally used.

WE illustrate herewith the new Snap Spring Terminal for use in connection with ignition wiring that has just been introduced by Messrs. Maxfield and Co., of 156, Victoria Road, Aston, Birmingham. The method of attaching the wire to the terminal is shown at A and B; the end of the insulation is cut away as usual, and the bare wire passed through the hole A and turned towards the rear above the cable; the latter is then firmly attached by squeezing together the clips C. Passing now to the method of attaching the terminal to the accumulator, induction coil, or sparking plug, it will be seen that within the hooked end is a spring D; by pressing this down the part to which the terminal is to be connected can be readily slipped between the body of the device and the spring, an attachment being thus obtained which is not only secure, without the use of any screws

or nuts, but which enables the terminal to be instantly removed at any time. Another feature of the fitting terminal is the cut-out switch E; this consists of a small brass strip with fibre handle, pivoted to the terminal, and when not in use lying immediately above the latter. When it is desired to test the ignition of a multi-cylinder engine the plugs can each be cut out in turn by moving round the switch until it is in contact with the body of the plug, thus creating a short circuit for the current. The snap spring terminal is being supplied both for use in connection with the primary or secondary circuits and with and without the cut-out switch. We understand that it can be obtained in London from Messrs. G. T. Riches and Co., Ltd., Store St., W.C., and Messrs. A. W. Gamage, Ltd., Holborn, E.C.

WHEN at the depot of the Wolseley Company at Westminster, recently, we were shown an exceedingly ingenious hose-pipe nozzle which has been devised by Mr. A. W. G. Harding. The nozzle, which is of rubber and attached to the end of the hose-pipe in the usual way, is so arranged that the ordinary turn-off cock is entirely dispensed with, the mere act of dropping the hose-pipe and nozzle on to the ground shutting off the water supply. This feature is obtained by means of a ball valve, operated by means of two levers within the nozzle. Thus, to allow the water to pass, the sides of the nozzle have only to be slightly pressed between the fingers. The idea is one that is well adapted for use in motor-car garages, as by its means any waste of water is prevented and much time saved in closing and opening the ordinary cocks. We understand that the self-closing nozzle is being put on the market by the Engineers' Universal Supply Stores, 25-27, Sumner Street, Southwark, S.E.

THE worm drive does not seem to be very popular in France, for at the Paris Salon it was only fitted to one car, a 25-h.p. Delahaye.

EASYMAN—Lend you my motor! What's the matter with your own? Speedy—Oh, I don't understand running a car well enough yet to use my own.—*Life*.

FOLLOWING the example set by the milk dealers in the German capital, a milk collection service by motor vehicle has been established by the Polk Sanitary Milk Company, of Indianapolis, U.S.A. The automobile is used between that city and Greenwood in collecting milk cans from the farmers along the route. The cans were formerly conveyed to the depots by the suburban electric railway, and long delays occurred. With the motor-wagon a collection trip from the dairies of the farmers to the city depot of the milk company is made in about three hours.

CONSIDERABLE interest was taken the other afternoon in the progress over London and the eastern suburbs of an airship containing three passengers. It was the "Gamage No 1," as could be discerned from the six feet long letters on the envelope. The passengers were the two brothers Spencer and Mr. L. Talbot, the aerial adviser to the well-known Holborn firm. The ascent was made from the Wandsworth Gas Works at half-past one. The aircraft passed over Wandsworth, Battersea, Lambeth, and Knightsbridge, reaching Holborn at ten minutes to two. After a little manoeuvring there it proceeded to the City and then bore towards Wanstead Flats. The airship descended at Bentley, near Brentwood, before four o'clock, having journeyed in all some thirty-five miles.

LIEUTENANT GRAETZ, the German officer who is motoring across Africa from Dar-es-Salaam to Swakopmund, arrived in Johannesburg on the 12th inst. in the best of health. He left Dar-es-Salaam in August, 1907, but was considerably delayed through having to cut roads and make bridges, besides making stops to repair the car and to wait for petrol. He has covered 3,700 miles in eight months, including many miles of virgin veldt. Crossing Lake Tanganyika with the car was a difficult business, owing to the smallness of the steamer. Lieutenant Graetz had to make a détour of 600 miles and cut a road through the bush in North Nyassaland owing to the impossibility of bridging the river. Continuous delays were incurred through the shortage of petrol and the necessity of sending great distances for supplies. The greatest friendliness and assistance was displayed by the natives in the uncivilised districts. Lieutenant Graetz will proceed during the present week through the Kalahari Desert to Swakopmund, a distance of over 2,000 miles.

THE latest addition to automobile literature is a book entitled "Electric and Petrol Vehicles" (London, Chas. Griffin and Co., Ltd.) It is from the pen of Mr. W. Poynter Adams, M.Inst. Electric Engineers, and forms Part II. of his work on "Motor Car Mechanism and Management." While we have no bias against the electromobile, which as a town carriage comes very near to the ideal, the author takes a somewhat more optimistic view with regard to the immediate outlook for this class of automobile than is, we think, justified by the actual position, for the large supply of electrically-driven cabs he alludes to has not yet made its appearance on the London streets, nor did the recent exhibition at Olympia point to any immediate developments. However this may be, Mr. Adams has dealt with his subject in an exhaustive manner; commencing with the sources of electricity, he deals successively with conductors and insulators, electrical units, magnetism, electro-magnets, dynamos, and electric motors, while in subsequent chapters electrical cars and their main components, the battery and the controller, under frames and chassis, the management of electrical vehicles, &c., are fully dealt with. Descriptions are also given of the leading types of electrical carriages, this section being very complete; the same cannot, however, be said of that devoted to petrol-electrical vehicles—those which are described are all more or less of the omnibus type, and in the experimental stages, while no mention is made of the Hart-Durtnall and Greenwood and Batley vehicles, nor of the several well-known continental types of "mixed" vehicles, such as the Belgian Auto-Mixte, the Austrian Mercedes-Mixte and the French Krieger and G.E.M. machines. The book concludes with a useful glossary of the principal technical terms appertaining to electrical vehicles.

MOTORING THROUGH EUROPE.

(Concluded from page 896.)

OVER mountain passes and into the Tyrol the travellers journeyed into the heart of the Dolomites and wound their way back to Paris by a historical route which our readers should learn from the book itself—assisted as they will be by the admirable maps in the volume. Having toured Central Europe and written 136 pleasant pages Mr. Trevor deals with the southern portion in equally delightful fashion. We would not anticipate the reader's pleasure by detailing the adventures that occurred, but cannot refrain from quoting the description of Pisa—illustrated by a capital photograph which we reproduced last week.

We had been warned that the road from Spezia to Pisa enjoyed the ominous reputation of being the worst in Italy, because it passes close to the Carrara marble mines and is badly cut up with traffic. This is only too true; the road delights in a collection of deep and deceitful gutters, whose erratic courses forbid anything above the second speed. To our

tically called, never had a foundation; although in dry weather it would doubtless be quite firm, now it exactly resembled a ploughed field. The "Mercedes" wheels sank so deep into the quicksand surface that when they stopped half a mile on the road they found that the ground scraping against the bottom of the car had torn away the tail lamp bracket, and nearly the whole of the luggage carrier. As the wheels at last refused to grip at all, they were compelled to put on the non-skids, while standing knee-deep in mud; by the time they were ten miles upon their journey it was striking nine. The road, to their surprise, actually became worse and worse (they hardly at first thought it possible), and they were reduced entirely to the first speed upon the level, for the wheels sank axle-deep in mud and loose stones. And—

On examining "Mercedes" next day we discovered that the new 935 by 135 tyre that had only run about forty miles was completely destroyed, the rubber hanging in pieces from its side, while the tread was bare canvas, cut and torn in a thousand places. The other back tyre, but a day old, was, if anything, even in a worse condition, and the front tyres were in rags; from this can be gathered some idea of the roads

In Southern Spain.

eft, amidst the green foliage, we caught a glimpse once or twice of the white quarries, and often we met or passed oxen patiently dragging heavy flat carts, on which reposed a massive block of uncut marble. But nothing could damp our expectations of Pisa; the name itself seems to bring back visions of the leaning tower seen long ago in stereoscopic views or old illustrated books.

Why, I wonder, is everyone brought up with the one idea that in Pisa there is but the one thing to see—the Tower? Directly one enters the gates all former visions vanish and new ones take their place never to be forgotten. As we entered the gateway through the high walls we found ourselves in a quiet, isolated square facing the four glories of Pisa. Nearest to us stood the round Baptistery, beside it the Cathedral, and beyond the slanting Campanile; to the left, in the background, is the famous Campo Santo; pure and white they stand as though finished but yesterday. Surely marble seemed never so lovely before!

Travel in Spain seems to have greatly impressed the travellers; while the roads made themselves known to the tyres. They left Andalusia, and the fact was brought to their notice by the weather; it rained incessantly for two whole days—a rest much appreciated, though they shuddered to think of the effect upon the road. It was still drizzling when they left at six o'clock in the morning on a proposed journey of 130 miles to the nearest town, Valencia. Outside the town the troubles began. The road, the "Royal Road" as it was sarca-

The wheels had sunk so deep into the ground that the stones had ripped the aluminium shield beneath the car almost to pieces, while the petrol tank, protected though it was with heavy wire netting, was dented and bruised in half a dozen places. Not a spring, gear, tooth, or vital part of the car was damaged, which is almost beyond belief, after the rough usage to which every part had been exposed.

Part III. of the work describes a journey in Northern Europe, with John o' Groat's as a starting point, and getting along to Folkestone—in three lines. This time the sceptical person of Part I. took his turn at the wheel. They had custom papers from the R.A.C. for France, Germany, Italy, Switzerland, and Austria, and the venturesome tourists also crossed the Danish and Swedish frontiers in their search of new scenes. We have quoted sufficiently fully to give our readers an idea of Mr. Roy Trevor's literary style, and have indicated the itinerary of his delightful tours. It now remains but to say that the volume is illustrated with a wealth of pictures and photographs that is rare—even in these days of *éditions de luxe*. There are nearly a hundred full page illustrations from photographs taken by the author, and some of which we are able to reproduce by the courtesy of the publisher, Mr. Edward Stanford. "En Route" is one of the best of the travel books of the year.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

TENDENCIES IN DESIGN. A PLEA FOR GREATER SIMPLICITY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whilst so much attention is being devoted to quieter running valveless engines, &c., it is surprising that the Olympia Show has not revealed any improvement in the direction where it is most urgently wanted, viz., the tyres. So long as the tyres are made of layers of canvas, rubber and leather, so long will they provide a continuous source of expense, trouble, worry and danger. At Olympia I heard complaints on all sides as to the tyres. I questioned several makers as to whether they were prepared to give any guarantee with their tyres. Not a single maker was prepared to do so. Is this not proof that the modern tyre is still totally unreliable? I venture to assert that the air tyre will be superseded. For some considerable time past I have used a new principle of resilient wheel with solid treads on my car and am deriving en-

held in Manchester, I declined, saying that if I did so I might prove a veritable Balaam, but I added that I would attend the meeting if I could. Since then, however, I have been asked to pay a professional visit beyond Oldham, an engagement which, had it not been for my motor-car, I should have had to decline, and this will prevent my being present at the meeting.

That there is a considerable amount of inconsiderate driving I have no doubt, and every man of good-will, whether a motorist or not, must wish this to be suppressed with a strong hand. But in seeking to regulate motor traffic it is well that we should remember that the motor-car is not merely the plaything of the rich; it is often the necessity of the poor. Thus I myself do not drive a motor-car because I can afford it, but because I cannot afford to do without it. A machine which enables me to get some miles beyond Oldham and back in the middle of a day's work is not a plaything. What is more, it has come to stay, and other things will have to be readjusted to some extent

A Juvenile Motoring Party on a Humber Car in Holland.

[De]Ants.

tire satisfaction from its use. The previous feeling of insecurity as to tyres is now unknown. I start and finish a run without a glance at the wheels. Motoring has a charm hitherto unknown. I am pleased to say the wheel is a British invention. The principle is simple. The wheel is of the ordinary artillery type, on the rim of which is secured a number of stout rubber cylinders of tubular section, over these is an ordinary wooden felloe carrying a steel rim, on which are secured the twin rubber treads. The hollow cylinders absorb vibration, and of course the cushioning device is practically everlasting. The cost of the wheel and solid tread but little exceeds that of a first-class tyre alone. Yours truly,

ARGYLL.

MOTORISTS AND THE PUBLIC.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I find that the publication of my name in connection with the Highways Protection League has led to a misunderstanding as to my real position regarding motor traffic control, will you kindly allow me to make a brief explanation? When I was asked to speak at the meeting to be

held in Manchester, I declined, saying that if I did so I might prove a veritable Balaam, but I added that I would attend the meeting if I could. Since then, however, I have been asked to pay a professional visit beyond Oldham, an engagement which, had it not been for my motor-car, I should have had to decline, and this will prevent my being present at the meeting.

The fact of the matter is, we have forgotten that the primary object of our roads was to facilitate traffic. Since the introduction of railways our roads have been used chiefly as playgrounds for children and as places where cats and dogs and cocks and hens might roam in safety. But owing to bicycles and motor-cars our roads are fast reverting to their original purpose, and this must prove very inconvenient until we have readjusted ourselves to these new conditions. Until then much consideration will rightly be expected from the motorist, and I am strongly of opinion that the inconsiderate driver who is regardless of the safety of the public should be imprisoned without the option of a fine. But the motorist, too, is deserving of consideration, which he very often fails to get.

In conclusion, let me say that things cannot be put right by cast-iron laws regulating the speed at which motor-cars may travel. Thus before 12 o'clock it may be safe to travel at a rate of 12 to 15 miles an hour, whilst after 12 o'clock, when the children are out of school, it is

not safe to travel on the same piece of road at more than five or six miles an hour. Inconsiderate legislation can only alienate the sympathy of motorists, many of whom are quite as desirous for the safety and convenience of the public as are the members of the Highways Protection League.—Yours truly,

E. VIPONT BROWN, M.D.

BRITISH MOTOR-CARS AT THE PARIS SALON.

To THE EDITOR of *The Motor-Car Journal*.

SIR,—It was mentioned in your report of the Paris Salon that the only British firm showing in the car section was the Wolseley. While all credit is due to this firm for their enterprise, it seems to me a pity that a bigger display was not made by English builders at this important international exhibition. It has been said that the import duty prevents any business being done in British cars in France. I am not, however, so certain on this point. Makers in Germany and Italy, as much on account of their business efforts as by the high quality and reputation of their productions, have been able to sell quite a number of cars to our French neighbours, and it would certainly seem that if two or three leading British concerns were to make a serious effort to develop a trade in France, they would have no reason to complain of the result. In any case, in view of the fact that the exhibitors of cars at the recent Paris Salon comprised no less than nine Italian, three Swiss, three German and five Belgian makers, all of whom are on the same footing as England as regards the question of import duty, it does appear a want of enterprise for the British automobile industry to be represented by a single firm.—Yours truly,

F. S. R.

WHAT IS DANGEROUS DRIVING ?

To THE EDITOR of *The Motor-Car Journal*.

SIR,—I hope the magistrates in country places will read what was said the other day by the Recorder of the Central Criminal Court with regard to motor driving. Whether a man was driving to the common danger or not, remarked Sir Forrest Fulton in charging the grand jury, depended very much upon the place where he was. That is a condition which should be recognised by the police and all interested in motor-cars—whether from the point of view of the man on the road or the man on the car. You have often urged, as have all advocates of automobilism, that when a straight open road presents itself the pace need not be reduced to the snail's pace to be observed in very populous places. But the fact seems to be disallowed by the police, whose traps are frequently set without regard to the conditions prevailing at the time and with no concern as to the local circumstances. Really in this matter the Recorder showed more common sense than whole benches of country magistrates have displayed.—Yours truly,

T. MILES.

THE PROTECTION OF VULNERABLE PARTS.

To THE EDITOR of *The Motor-Car Journal*.

SIR,—There is one feature in connection with the general design and construction of motor-cars that does not seem to have received the attention it deserves, namely, the safe location of the more vulnerable parts, such as, among others, the lamps, the radiator, and the petrol tank. In considering the choice between the gravity and pressure fuel feed systems, there is no question that the gravity feed tank under the front seat is much better protected from mechanical injury than the pressure feed tank at the rear of the car. The latter was introduced by a prominent German firm, and was highly popular at one time. It is clearly apparent, however, that a return movement to the gravity feed system with its better protected tank has set in, and there is really no reason why this arrangement should not be universally used, as the one difficulty, of cessation of feed on steep hills, can be met by the provision of a small auxiliary reservoir near the motor. It is, of course, not possible to build cars so that they cannot be injured by collisions, but they can be designed in such a way that the relatively delicate parts and those whose injury involves personal danger or great cost of repairs are relatively safe, and that those which are damaged can be repaired at a minimum cost. The new spring arrangement of the N.E.C. is a case in point. The practice of locating the radiator at the rear instead of at the front of the engine is also gaining adherents. For some time care has been taken by a certain number of manufacturers to so locate the lamps on their cars that they will not act as bumpers in case of a collision, for which purpose they are poorly adapted.—Yours truly,

W. H. C.

CRACKED CYLINDERS.

To THE EDITOR of *The Motor-Car Journal*.

SIR,—I have a small car with a single-cylinder motor the water-jacket of which is cracked. I believe steel filings mixed with some kind of acid will rust it up. Can you tell me the name of the acid, or where to procure the mixture, and how to apply it?—Yours truly,

C. B.

[The liquid used in conjunction with steel filings for rusting cracked water-jackets is sal ammoniac dissolved in water. The crack should be filled

with filings and the sal ammoniac either placed in the jacket or poured over the filings. If the crack is only small, a little gold size mixed with lampblack will sometimes stop the leakage, but this should be allowed to get properly hard before the motor is used. Our correspondent would be well advised to entrust the work to one of the firms making a speciality of the repair of cracked cylinders.]

MOTOR TAXI-CABS.

To THE EDITOR of *The Motor-Car Journal*.

SIR,—May I suggest that you would do well in the interests of the public who, not being motorists in the sense of owning cars, are, nevertheless, in the habit of using motor-cabs in public service in London, by drawing attention to the gross inaccuracies which are daily registered by the taximeter? On several occasions recently when engaging such vehicles I have found great differences on different dates. The charges, whatever they are, have invariably to be paid, as one does not like to incur the "language" of the average London cab-driver. Those responsible for the direction of these services would do well to give attention to the matter.—Yours truly,

T. ASHMOLE.

THE DISPOSAL OF PETROL.

To THE EDITOR of *The Motor-Car Journal*.

SIR,—Referring to your article "Petrol in Sewers," I would like to point out that petrol is used by other persons than proprietors of garages. The cost of the spirit is in itself sufficient to prevent it finding its way into the sewers, and, with regard to many establishments, such precautions are taken that this event is practically impossible.

Might I suggest to Mr. Alderman Auglim, of the Marylebone Borough Council, that he and his brother councillors should ask their better halves what they did with that petrol after washing the blouse?—Yours truly,

G. CAMPLING.

The Ariel 20-h.p. Phaeton recently supplied to Capt. Raffan, Sydney, New South Wales.

The vehicle is one of the Ariel Company's new popular-priced 20-h.p. models. The four-cylinder engine (100 mm. bore by 115 mm. stroke) is fitted with magneto ignition; the chassis has a gate-controlled three-speed gear, live axle, ball bearings throughout, except in engine, and Dunlop tyres. We understand that the Ariel Company are shipping a number of these cars to the colonies, Spain and Portugal.

A NEW PETROL ENGINE.

To THE EDITOR of *The Motor-Car Journal*.

SIR,—Being interested in inventions, I was told by a friend of mine to call on Mr. Burgess, Motor Garage and Repair Works, Hay Mill, Birmingham, where I was shown a new petrol engine he had invented, which no doubt will be one of the greatest eye-openers of the present century. The idea, which is a simple one, will enable an ordinary 20-h.p. four-cylinder engine to be altered into a 40-h.p. and made equal to an eight-cylinder, the bore and stroke remaining as before. The invention can be applied to both air and water-cooled motors. The new engine will, I understand, be put on the market early in 1909.—Yours truly,

ENGINEER.

REPLYING TO "A. D." the most recent work on magnetos is that by Mr. S. R. Bottone (88 pp., 35 illustrations), 2s. net, and sent, post free, for 2s. 2d. by Cordingley and Co.

ON Friday last week we received from the postal authorities an addressed label marked "Fragile, with care, urgent," which had been found detached at the London (West Central) post office. The label bears no evidence as to the sender or the matter to which it was attached. If this should catch the sender's eye, perhaps he will communicate with us without delay.

A DIRECT-READING AUTOMOBILE POWER METER.

PROF. C. R. MOORE, of Purdue University, and Mr. J. Harris, of the Central Laboratory Supply Company, of Lafayette, Ind., U.S.A., have recently developed and patented a power and speed indicator, specially adapted for use in testing motor-vehicles, which is unique in the fact that it indicates directly on a scale, without any calculations whatever, the horse-power developed at the road wheels at any speed and the speed in miles per hour. The instrument should be useful to

Fig. 1.—Side View.

manufacturers as a convenient method of testing the driving power of a complete machine, the test being easily and quickly made, without any changes being necessary in the car to prepare it.

Referring to the illustrations, it will be seen that the rear wheels of the car to be tested are run upon two wheels A spaced to correspond to the tread and mounted on a shaft B beneath the floor. The front wheels of the vehicle are blocked, and the machine securely locked to a post in the rear. When the automobile is started it cannot move itself, but it drives the two wheels A. To place a load on the engine an absorption brake F is connected to the end of the shaft. The power required to drive the brake is changed or adjusted by means of a hand wheel within reach of the operator. The ingenious part of the apparatus is the device which indicates the power. It is comparatively easy to make an indicator which will show the power correctly at one speed, but to produce an instrument which will indicate the power delivered by the engine at

Fig. 2.—Front View.

any speed is not so simple a matter. The power-meter is connected between the shaft B and the spindle of the brake; it consists of two discs C, one fastened to the shaft B, the other to the shaft of the brake, and connected by a spring. All the power developed by the motor vehicle is transmitted to the wheels A and the shaft B, and then through this spring to the brake. The spring is so designed that twice the sine of half the angle of deflection is proportional to the torque deflecting it. When the brake is applied the spring is deflected by the power transmitted through it.

Connecting to each of the discs C is a small revolving field alternating current generator. The latter are exactly similar, and produce sine waves of voltage at the same potential. It is well known that when two alternating currents of the same voltage and wave form are directly opposed to each other no current will flow, but if the alternating waves are displaced, then a current will flow proportional to twice the sine of one-half the angle of displacement. The two generators are connected in opposition and so placed that they exactly oppose each other when there is no deflection of the spring between the discs C. A voltmeter is placed in the circuit between the two small generators. When no power is transmitted there is no deflection of the spring and no current flows, consequently the voltmeter reads zero. When power is transmitted by the spring it is deflected, and the two alternators are thrown out of step by an amount equal to the deflection of the spring. The torque is proportional to twice the sine of one half the angle of deflection of the spring. Also the current through the voltmeter is proportional to twice the sine of half the angle of displacement of the two alternating currents, which is also the deflection of the spring, so that the current through the voltmeter at a given speed is directly proportional to the torque.

The horse-power transmitted is proportional to the torque multiplied by the speed. Likewise the voltage of the little generators also changes with the speed, as well as with the deflection of the spring, so that increasing either the speed or the torque will increase the reading correspondingly. Therefore, the voltmeter gives a reading proportional to the product of the speed and the torque—i.e., it shows the horse-power transmitted. The voltmeter, of course, is calibrated in terms of horse-power instead of volts, and is the only instrument of the kind which has been devised to read horse-power directly on a scale without any mathematical calculations whatever. Furthermore, since the voltage of either of the alternators alone is proportional to the speed, by connecting one of them directly to the second voltmeter, the revolutions per minute or miles per hour can be read off the scale.

The shaft, wheels, brake, &c., of the outfit are all placed beneath the floor so as to be out of the way. The instruments for reading horse-power and speed can be placed on a table or mounted on a wall. The use of revolving field alternators for indicating the displacement of the spring does away entirely with contacts, brushes and moving electrical connections, which makes the apparatus reliable and unlikely to get out of order. The manufacturers, the Central Laboratory Supply Company, of Lafayette, Ind., U.S.A., also furnish recording voltmeters, which may be used instead of or in connection with indicating instruments, so that a complete record of the test can be made. The range of the power-meter can be quickly changed by removing the spring and inserting another of greater or less strength. The brake is supplied with an attachment so that if need be the spring can be quickly calibrated.

THE RULE OF THE ROAD.

At the Worthing County Court, on Monday, before Judge Scully, Reginald Dunn, of Teville Road, Worthing, sued W. J. Slaughter, of Arundel, for £5 for damage to a motor-bicycle.

Plaintiff stated that on October 12th he was riding a motor-bicycle from Portsmouth to Worthing, and when commencing to ascend the hill just above the railway bridge at Arundel Station he saw three horses belonging to the defendant coming down the hill in single file. Witness was on his proper side of the road, travelling at from twelve to thirteen miles an hour, but the horses were not on their proper side, because they were being led. They were on the opposite side of the road and the men leading them were between the horses and the hedge. Cross-examined by Mr. Thompson, witness said he did not at the time know there was any difference in the rule of the road for led horses, and imagined that he was right in keeping to his near side. Mr. Stent, job-master, of Worthing, and a blacksmith named Hanmore gave evidence to the effect that the rule of the road with regard to led horses was that they should always proceed on the off side of the road, and be led with the right hand—just the reverse of the rule of the road for ordinary traffic.

His Honour said he had come to the conclusion that the accident happened through plaintiff keeping to his near side, perhaps under the impression that the horses were not going to cross over, but perhaps because he was in ignorance of the rule of the road for led horses. This latter, he thought, was the true state of the case. Plaintiff ought to have steered over to his right when he saw the horses coming. If plaintiff knew this particular rule of the road he ought to have expected the horses to be led over. Judgment would, therefore, be for the defendant, with costs.

THE MODEL MANUFACTURING COMPANY, of 53, Addison Road North, Holland Park, London, W., have issued a table of diameters of blanks for spur gear wheels, which should prove extremely useful to motor repairers and others who turn out their own blanks but have to get the teeth cut elsewhere. To those not regularly engaged in this work it is a little troublesome to have to calculate the diameter of the blank each time they are going to make one, and a table of this sort ready to hand will be a convenience. The diameters are stated in decimal fractions, and to facilitate measurements a table is also given showing the equivalent decimal and vulgar fractions. The Model Manufacturing Company will be glad to send a copy of these tables to anyone desiring the same on receipt of stamped addressed envelope.

CLUBS AND ASSOCIATIONS.

ROYAL.

WITH the New Year a series of individual trials will be carried out under the Club's official observation, at the request of a number of manufacturers. There are already six applications in hand for such trials.

MOTOR UNION.

PROFESSIONAL motor drivers and mechanics have now an opportunity of securing certificates from the Motor Union. These are given on satisfactory evidence of qualification and on passing an examination.

The poll of members of the Devon and Cornwall A.C. on the question of affiliation has resulted in a decision to affiliate with the Motor Union for 1909. The voting was: for the R.A.C. 16, for the M.U. 71, and neutral 64.

BROOKLANDS.

STEERING a 14-16-h.p. Laurin-Klement, Count Kolovrat made speed tests under the official observation and timing of the Royal Automobile Club at Brooklands last week. Over the flying half-mile his time was 25.8 sec., which represents a speed rate of 69.76 miles per hour, and his speed over a whole lap of 2 11.16 miles, which he covered in 2 min. 24.8 sec., was 68.76 miles per hour.

Otto Hieronymus, on the 11th inst., attempted to beat the speed of 69.76 miles per hour for a 14-16-h.p. car recently attained by Count Kolovrat on the Brooklands track. In this he was successful, his performances being as follows:—

Half-mile Flying Start.—24 2.5 sec. = 73.77 miles per hour.

Five Laps (about 14 miles), Flying Start.—11 min. 22 3.5 sec. = 72.15 miles per hour.

Ten Laps (about 27½ miles), Flying Start.—22 min. 58 3.5 sec. = 72.25 miles per hour.

HIGHWAYS PROTECTION LEAGUE.

At a meeting held on the 11th inst., at Manchester, a local branch of the Highways Protection League was formed, this being the first incursion of the League into the provinces. Dr. Alfred Hopkinson, K.C., Vice-Chancellor of the Manchester University, was in the chair, and urged that in cases of offences under the Motor Car Act not only the chauffeur but the owner of the car should also be brought to book. Mr. A. R. Butterworth, the chairman of the Executive Committee of the League, made a speech on similar lines to those with which he has familiarised the anti-motorists of London, and then a resolution urging the necessity for legislation was moved. This having been seconded, Mr. S. W. Royse raised the question of the upkeep of the road, and the incidence of its taxation, moving an addition to the resolution, to which Mr. W. E. Rowcliffe moved a further addition in favour of a central road authority. This was accepted by Mr. Royse and his seconder, but on being put to the meeting was rejected.

HERTFORDSHIRE COUNTY.

ON Thursday of last week the annual dinner of the Hertfordshire County A.C. at the Hotel Russell, London, was the occasion for the assembling of a number of members and friends. Mr. S. Saker, the chairman of the club, presided, and a most enjoyable evening was spent. Some interesting speeches followed the dinner, among those speaking being Messrs. S. Saker, Ernest Webster, N. W. Colliver, Victor Beveridge, D. Corse Glen, Cutler, T. Williams, and E. H. Arnold. The musical programme was under the direction of Mr. H. Sainsbury. Those present included Mr. and Mrs. S. Saker, Mr. and Mrs. A. Saker, Mr. and Mrs. W. Young, Mr. Ernest Webster, Mr. Barber and Mr. S. S. Barber, Mr. Strevens, Mr. Gray, Mr. Cutler, Mr. E. H. Arnold, Mr. T. Williams, Mr. H. Sainsbury, Mr. D. Corse Glen, Mr. and Mrs. V. Beveridge, Mrs. Bemrose, Mr. H. W. Colliver, Mr. Harper, and Mr. A. J. Salmon.

MIDLAND.

ON Saturday the annual meeting of the Midland A.C. was held at the Grand Hotel, Birmingham, Mr. Ryland being in the chair. Mr. Litchfield Meek, the hon. sec., presented the report, which showed a membership of 299, an increase of 27 during the year. The club's capital account stands at £816.

Mr. C. Vernon Pugh was elected president, Mr. R. S. Foster added to the list of vice-presidents, Mr. Meek appointed hon. sec., and Mr. T. P. Type, hon. treasurer.

HUDDERSFIELD.

LAST week the Huddersfield A.C. held its annual meeting at the George Hotel, Huddersfield, with Alderman W. H. Jessop in the chair. The balance-sheet showed total receipts of £264; the membership was reported to have risen to 181, an increase of 24 during the year. The election of officers resulted as follows:—President, Alderman W. H. Jessop; vice-presidents, Messrs. T. Naylor, H. Greenwood, A. Dawson, H. Broadbent, R. V. Middlemost, W. E. Wimpenny, E. Hoyle, Wm. Ramsden, J. Blamires, and K. F. Campbell; chairman of committees, Mr. W. E. Wimpenny; secretary and treasurer, Mr. E. G. Learoyd;

committee, Messrs. J. W. Crowther, F. Sutcliffe, T. Shires, J. W. Hobson, W. Priest, W. H. Wilson, B. P. Allan, Samuel Russel, Dr. Moore, J. E. Dyson, G. A. Crowther, Councillor Murgatroyd, and Harry Lawton; auditors, Messrs. J. D. Simpson and E. Lawton.

SOUTHERN.

THE Triumph medal for the single-cylinder motor-cycle class in the last hill climb has been awarded to Mr. J. H. Wheeler, 3½-h.p. Triumph; a Triumph was also second.

The committee have decided to hold a social evening at the club headquarters every Thursday, commencing at 8.30 p.m.

LINCOLNSHIRE.

A MEETING of the committee was held at the Carre Arms Hotel, Sleaford, on Monday. The result of the postal vote on the subject of affiliation was received as follows:—Motor Union 74, Royal A.C. 67, neutral 4, too late 4. The Club will, therefore, remain affiliated to the Motor Union for 1909. A letter from the G.N.R. Company was read, stating that in response to the request of the club the Weelaby road crossing, near Grimsby, would be kept open except when trains were actually expected.

LADIES.

THE lecture which Mr. C. Y. Knight gave to the Ladies' Automobile Club on Thursday of last week was of considerable interest and was delivered with that freedom which gave so much pleasure to his earlier

T. B. Limer on the Chalmers Detroit Car which finished third in the A.C.A. Light Car Race in Savannah, attaining an average speed of 50 miles per hour.

audiences on the same subject at the R.A.C. The address to the Ladies' Club was at Claridge's Hotel, and Lady Margaret Jenkins was in the chair. Among the other members of the club who were present were the Countess of Dysart, the Hon. Mrs. Assheton Harbord, the Hon. Mrs. Herbert Stourton, Mrs. Edmunds, Miss Honeyman, Mrs. Manville, Mrs. Newton, Mrs. Pennell Tate, Mrs. Walpole, Mrs. Waller, and Miss K. d'Esterre Hughes, secretary of the club.

MOTOR-CYCLING.

THE seventh annual dinner of the Motor-cycling Club was held on Saturday at the Trocadero Restaurant, London, when Mr. Charles Jarrott, president of the club, occupied the chair. The vice-chairs were taken by Messrs. R. G. Booth, R. C. Davis, R. H. Head, and J. Van Hooydonk. Mr. A. Candler replied to the toast of the club, and that of the visitors was proposed by Mr. Van Hooydonk, Mr. Todd responding. During the course of the evening the prizes gained by members during the season were presented by Mrs. Jarrott, the principal awards being:—Albert Brown Trophy, won by Mr. F. J. Jenkins; Schulte Cup (London to Edinburgh and back), won by Mr. J. Platt Betts, who is now the absolute winner of the cup, having won it two years in succession; the Motor-cycling Club Challenge Cup, won by Mr. S. G. Frost, who was also the winner of the cup presented by Mr. Charles Jarrott for the London to Land's End and Back Run.

SCOTTISH.

THE Road Surveyors' Association of Glasgow having accepted an invitation to a conference with the members of the Scottish A.C., a meeting was held in the Central Hotel, Glasgow, on the 11th inst., at which reports by Mr. R. Drummond, C.E., president of the Road Surveyors' Association; Mr. J. R. Nisbet, of the Club Committee, and other representatives to the recent International Road Congress in Paris, were submitted. These formed the basis of a discussion. Sir J. H. A.

MacDonald, K.C.B., Lord Justice Clerk of Scotland, president of the Club, occupied the chair, and there was a large and representative attendance.

Mr. Drummond, who read the first paper, referred to the work that had been carried out by local authorities since the abolition of tolls, and particularly since the inception of the County Councils, and said that since the reorganisation of the methods of road maintenance there had been introduced into the country steam road rollers, boring and breaking machines, motor tractors, and other machinery to a value of about £200,000.

In the course of his contribution Mr. J. R. Nisbet sketched rapidly the work of the Paris Congress, in which even China and Japan had evinced an interest by appointing delegates. Though only semi-officially recognised by the French Government at first, its importance became so manifest as to command the direct support and constant patronage of the Ministers of Public Works and Roads and Bridges. To him the most interesting part of the Congress was the exhibition of methods of road construction and the apparatus used for the purpose. So much of this was the product of the brains of English and Scottish surveyors, and so many of the resolutions of the Congress were based upon British practice, that he came to the conclusion that the inhabitants of these islands were in the enjoyment of the most advanced systems of road construction and maintenance. It was clear to him that the road surveyors of this country were fully alive to all that was demanded of them in providing for modern locomotion. They only lacked the means.

The discussion was opened by the Chairman. The worst thing, he said, that could get into a road was water. Being an automobilist and also having been a driver of horses, his view was that the first thing that let water into a road was the effect of a horse's hoof, and also the feet of sheep. Then the wheel came. The result was that the road became full of puddles in wet weather. He thought road surveyors might consider that when they accused automobilists of making a lot of pits in the road, they must construct roads off which the water would run. He suggested that experiments with this end in view should be carried out.

On Saturday the Junior Institution of Engineers paid a visit to the Walthamstow premises of the London General Omnibus Company, and on Wednesday a paper on Motor Omnibuses was read to the members by Mr. Eric F. Boulton, the latter meeting taking place at the Royal United Services Institution, Whitehall, S.W.

THE American Automobile Association now has 187 clubs and 20,000 members in federation.

A RESOLUTION to form a Birmingham graduates' branch of the Institution of Automobile Engineers was adopted at a meeting on Tuesday over which Mr. Max R. Lawrence presided, and at which Dr. H. S. Hele-Shaw gave an address.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

DE DION-BOUTON (1907), LIMITED.—The second ordinary general meeting of the shareholders in this company was held on the 10th inst., Mr. S. F. Edge presiding. The chairman said that the accounts covered a period of eighteen months, the reason being that it was preferable to make them up to September 30th, instead of in March, which was a very busy time in a business such as theirs. The profit for the eighteen months amounted to £22,411. Since the incorporation of the company there had only been a loss of £29 on account of bad debts, and against that item they had a reserve of £750. The item of unpaid calls, £8,693, referred to calls in arrear by certain shareholders who had brought an action against the company. The turnover of the business was about £250,000, and therefore the amount of £15,000 for sundry debtors was quite a reasonable figure. The orders in hand, as compared with the corresponding period last year, showed an increase of 65 per cent., in addition to which they had sixty cars on order for delivery after September 30th, 1909. Mr. H. H. Fuller seconded the motion, which was unanimously adopted.

DUNLOP PNEUMATIC TYRE COMPANY.—The profit of the Dunlop Pneumatic Tyre Company, Ltd., for the twelve months ended September 30th, 1908, after providing for fees, depreciation, and debenture interest, amounted to £192,941. This, with £19,271 brought forward, makes a total of £212,213. Interim dividends have been paid as follows:—Preference at 5 per cent. per ann., £24,874; ordinary at 8 per cent. per ann., £24,999; and deferred at 5 per cent. per ann., £12,499. The directors recommend: Further dividend on the preference shares at the rate of 5 per cent. per ann. for the half-year ended September 30th, 1908, amounting to £24,874; further dividend on the ordinary shares for the same period at the rate of 8 per cent. per ann., £24,999; further dividend on the deferred shares for the same period at the rate of 11 per cent. per ann., £27,497; reduction of goodwill, £60,000; balance to be carried forward, £12,467. The automobile trade last year received a temporary check. Notwithstanding these adverse conditions, the profits, apart from certain failures in the automobile trade, which caused a loss of about £8,000, were maintained during the year. The recommendations set out above further strengthen and consolidate the position of the company. The original debenture issue authorised was £1,000,000, of which £666,700 has been redeemed and cancelled, leaving outstanding £333,300 redeemable in 1916. If the present rate of progress can be maintained the directors anticipate no difficulty in dealing with this obligation.

PALMER TYRE, LTD.—A dividend at the rate of 12½ per cent. per annum has been made by the Palmer Tyre, Ltd., the accounts also

showing £2,500 added to reserve, and £1,012 carried forward. The annual meeting was held on Tuesday, Major L. Darwin presiding. He said there had been an improvement in the profits of 35 per cent. There had been an increased sale of motor tyres, and he anticipated that next year he would be able to report further progress in the direction of development. The Continental business was increasing, and it had been found necessary to open depots in Paris.

THE ROVER COMPANY.—The annual meeting of the Rover Company was held at Coventry on Tuesday. Sir Frederick Dixon-Hartland presided, and in moving the adoption of the report, showing a loss on the year's trading of £5,388, expressed regret that the result was so unsatisfactory and that the directors were unable to recommend any dividend. The loss was chiefly accounted for by preparation having been made for a motor-car boom which did not come. Important economies, however, had been effected, and he had strong hopes that next year would be better. After some discussion the report was carried, and Sir F. Dixon-Hartland was re-elected director.

THE Motor Barge Syndicate, Ltd., with a nominal capital of £25,000, has been formed this week in connection with an issue of 2,200 shares of £10 each. The registered office is at 10, Philpot Lane, Fenchurch Street, London, E.C., and it is proposed to commence operations with two or more barges of 300 tons each. According to the prospectus there are more than 4,000 motor driven cargo carrying vessels doing sea and river work in Holland.

MESSRS. HATTERSLEY AND DAVIDSON, of 138, Norfolk Street, Sheffield, has been registered as a limited liability company with a capital of £15,000 in £1 shares.

THE Vinet Rim Syndicate has been registered, the capital being £10,000 in £1 shares.

SWIFT CYCLE CO.—Mr. Alfred Du Cros presided at the annual meeting of the Swift Cycle Company, at Coventry, on Monday, when the report, showing a profit of £24,584, was presented for adoption. The chairman said the report, in common with those of the whole of the cycle trade, showed less profit than previous years. The motor department, which they had developed from a very small beginning, had, however, largely increased during the past year, and had been a source of profit. Last year orders taken at the Motor Show exceeded those of the previous year by 40 per cent., and this year that increase had been further exceeded by 18 per cent. He expressed a confident hope of future success. The report was adopted, and Preference—6½—and Ordinary—5 per cent.—dividends were declared.

DARRACQ-SERPOLLET OMNIBUS COMPANY, LTD.—The report of the directors, which is to be presented at the meeting of the company to be held on Monday next, gives a profit and loss account showing a debit for the year of £17,154 and a total debit balance of £24,448. The unsatisfactory result of the year's trading was due to the almost complete stagnation into which the business of supplying motor-buses and similar vehicles had fallen during the last twelve months.

SOME particulars are available of a new enterprise on the part of Mr. Harvey du Cros, J.P., his son, Mr. Arthur du Cros, M.P. for Hastings, and other members of the family. In order to compete with the foreign-made taxicabs which have been introduced into this country, a company has been formed for the purpose of placing about 2,000 motor-cabs on the London streets within the next twelve months. Accommodation for 1,000 is now in course of provision at Acton Vale. Arrangements have been made to train drivers in classes of twenty-five forthwith, and the Messrs. du Cros are giving the first opportunity to join the classes to men from the places with which they are associated either by business or residence.

ARGYLL MOTORS, LTD.—A meeting of the ordinary creditors other than debenture stockholders of Argyll Motors, Ltd., was held on the 9th inst. in Glasgow by order of the Court of Session. Mr. J. S. Matthew was elected chairman. Mr. John M. Macleod, joint liquidator, made a statement, in the course of which he asked the creditors when they were considering the proposed reconstruction scheme to view the matter as a whole and to take into consideration in doing so the three principal difficulties which the liquidators had to deal with. First of all, the comparatively small amount of the valuations; in the second place, the large and varied interests of those concerned in the liquidation; and in the third place, the want of the necessary working capital should the company be reconstructed. As to whether they had been carrying on the work at a profit or loss since the date of liquidation, he said that the work they had been doing, excluding interest, &c., on cost charges, had undoubtedly met the expenditure. They had been realising stock which was valued low at full price, if not more, and he thought he had the backing of the working committee when he said that they had certainly not incurred any loss. In regard to the working capital, he thought there would be, in addition to the sum of £77,000, at least £30,000 or £40,000 of liquid capital. He anticipated that after all the expense of liquidation, flotation and underwriting, there would be at least £100,000 clear working capital. The meeting ultimately unanimously approved of the proposed scheme of reconstruction.

THE Dumfries Motor Company, Ltd., of English Street, Dumfries, send a calendar for 1909, which also serves the purpose of keeping their hiring and motor accessory departments well before the notice of motorists.

THE Automobile Lubricants Department of the Vacuum Oil Company, Ltd., having outgrown their accommodation in Norfolk Street, Strand, W.C., have removed to Caxton House, Westminster, S.W., where Mr. A. E. Newton will in future have his headquarters.

CASES AGAINST MOTORISTS.

NO JURISDICTION.

An important case was heard by the Wimborne (Dorset) County Bench on the 11th inst. A short time ago a serious collision took place between a motor-car driven by Prince Jitendra of Cooch Behar and another car at the cross roads near Wimborne, whereby both cars were seriously damaged and several of the passengers injured. At the hearing Mr. Staplee Firth appeared for the prince and stated that though he was desirous of the magistrates hearing the case, and was willing to submit to their ruling, as he was the son of a ruling prince he was afraid the Court had no jurisdiction to try the case. After discussing the matter with the clerk to the justices the magistrates held that they had no jurisdiction to try the case.

"ROMEO" KILLED BY A MOTOR-CAR.

At the West London County Court the Bishop of Kensington has been the defendant in an action, the plaintiff being Reuben Clarke, a chauffeur, who claimed £100 damages for the loss of a Pomeranian dog, which was run over and killed by the Bishop's motor-car. Mr. Randolph, counsel for the plaintiff, said the accident occurred on July 31st, through the alleged negligence of the Bishop of Kensington's chauffeur. The plaintiff was chauffeur to Captain Lund, whose motor-car was kept at a garage in Ashbourne Mews, and at a neighbouring garage was kept the motor-car of the Bishop. On July 23rd the plaintiff was taking two valuable Pomeranian dogs he owned for a run, when the Bishop's motor-car was driving out of the garage, and, in spite of the plaintiff crying out, "Stop, please!" and whistling to his dogs, one of the wheels of the car passed over the more valuable of the two animals and killed it on the spot. In defence, Thomas Knowles, who said he had been chauffeur to the Bishop of Kensington since October, 1907, denied that there was any negligence on his part. Mr. Glasgow, counsel for the defence, said, personally, the Bishop was not interested in the action, because he was insured, and the insurance company were practically the defendants in the action. The jury, after retiring three times, found for the plaintiff, and assessed the damages at £50 and costs.

UNSUCCESSFUL APPEAL.

Mr. Harold B. Gylee was unsuccessful in his appeal heard on Saturday by Mr. Justice Darling, Mr. Justice Phillimore, and Mr. Justice Walton, against a conviction at the Lewes Assizes for the manslaughter of a girl named Denman. He was sentenced to three months' imprisonment in the second division for manslaughter by reckless and palpable negligence in driving a motor-car along the Worthing road, on August Bank-holiday.

Mr. Justice Darling, giving judgment, said the appellant appealed against his conviction on questions of law, and asked for leave to appeal on questions of fact, but they saw no reason to grant leave. Therefore the appeal must be dismissed. Eight days of the sentence was allowed, as though the appeal had been heard on the previous Friday week.

DANGEROUS DRIVING.

The driver of a Grand Prix racing car belonging to the Princess Waisemski has been fined £10 and costs by the Reigate Bench for driving through the village of Charlwood at a speed dangerous to the public.

The driver of a motor-car, charged with dangerous driving on the Harrogate and Arthington road, at Weedon, has been fined £25 and costs.

ALLEGED MANSLAUGHTER.

A verdict of manslaughter was returned by a coroner's jury on the 10th inst. at Coventry against Mr. Harry Ambrose Smith, works manager of the Deasy Motor Manufacturing Company, as the result of the inquiry into the death of a boy who was killed through Smith's motor-car. Police court proceedings were pending, and were resumed on the following day, when the case was again adjourned till Tuesday. Then the defendant was committed for trial.

ALLEGED OBSTRUCTION.

Before the Wokingham County Bench, Arthur Salmon, of Reading, was summoned for obstructing the highway at Woodley, on November 30th. P.C. Fisher said that at 10 p.m. he saw a motor-car standing on the road with no one in attendance. The driver said he had run out of petrol, and had to go about half a mile to obtain a further supply. A fine of 14s. 6d., costs inclusive, was imposed.

THE SERVICE OF A SUMMONS.

At the Haywards Heath Petty Sessions, on Monday, Lionel Martin, Ryder Street Chambers, St. James's, W., was summoned for a speed of 30 miles an hour between Bolney and Newtimber on July 19th and for 25 miles 5 furlongs speed between Newtimber and Bolney on the same date. Lord Tiverton (instructed by Messrs. Kenneth Brown and Co., London) appeared for the defendant.

P.s. Budgen gave evidence of timing defendant's car at Bolney. P.s. Huntley gave evidence as to timing it at Newtimber. On July 25th he went to London to serve notices of prosecution. He saw the liftman at Ryder Street Chambers, and the latter said defendant was not at home, but was expected home that evening. Witness left the notices with the liftman.

P.s. Waghorn said that on July 19th he was stopping cars to inspect licences at a point south of Slangham cross-road. Defendant drove up, and, seeing what was going on, backed his car about half-a-mile, a very dangerous practice. Witness and another police officer ran after the car, but could not get up to it. The car lacked into a gateway, turned, and went away towards Brighton. On trying to serve the summonses he was told defendant was on tour. On a subsequent date he saw defendant at Handcross. Witness asked for his address. He produced his licence, which had another address

upon it. Witness asked for the correct address, as he had two summonses to serve for offences on July 19th. On Nov 10th he went to serve the summons. He was told defendant would be there next day. Next day he went up the lift, and told the attendant to give his name as "Thompson" to the defendant. The attendant came back and said Mr. Martin did not know a Mr. Thompson and would not see witness. Witness handed the man the summonses, and said, "Give these to Mr. Martin and he will see me." He heard Mr. Martin say, "Oh, the — has turned up. Show him in." He said to witness: "So this is the way you do your dirty business!" Witness replied: "When we have gentlemen like you to deal with." Witness had tried several times to serve the summonses, but without success, and this was the cause of the delay.

Lord Tiverton submitted that there was no evidence of service of notice within twenty-one days. They had no evidence that Mr. Martin was residing at Ryder Street at the time the notices were left with the liftman, who, he contended, was in the service of the landlord and not of defendant.

Mr. Lawson Lewis contended that the notice was served just in the same way as a postman would have delivered it if sent by post.

The Magistrates considered the point and found that the service of the notice was good.

Two previous convictions were proved and defendant was fined £20 and £9, with costs, £1 19s. and 17s. 10d. respectively; licence to be suspended for the remainder of its term, and defendant further disqualified for a period of twelve months.

On the application of Lord Tiverton, the magistrates decided to state a case on the point he had raised.

SEVERAL cases were before the Horsham magistrates on Saturday and others are reported from Wokingham (3) Reigate.

AERONAUTICS.

THE annual dinner of the Aero Club of the United Kingdom was held on the 10th inst. at the Hotel Ritz, London, under the chairmanship of the Duke of Argyll. The company also included Mr. R. W. Wallace, K.C., Admiral of the Fleet Sir Edward Seymour, the Hon. C. S. Rolls,

A New Idea in Country House Design.

[Motor, New York.

Colonel W. J. Bosworth, Sir Hiram Maxim, Messrs. Dugald Clerk, E. Manville, J. W. Orde, A. K. Huntington, Lieutenant A. T. Dawson, Prince Paramjit Singh, Rees Jeffreys, the Hon. Mrs. Assheton-Harbord, Baroness de Heeckeren, Captain Grubb and many others.

In proposing the toast of "The Club," the Chairman said that even to outsiders it was obvious that ballooning had passed out of the region of pleasantries and had become a serious question to be seriously considered by every nation. Much had been done of late with regard to dirigibles and aeroplanes, and the remarkable flights that had recently been made in France, Germany and America had called attention to the necessity of considering the possibility of having every part of the country inspected by transient visitors, who might or might not have hostile intent. Every country was in the same boat, or balloon, with regard to the precautions it must take against intrusions of dirigible balloons or aeroplanes. To balloonists and aeroplanists no country now had frontiers; and dirigible balloons carrying a weight besides equipment of 1,300 lb. or 1,400 lb. could make themselves extremely disagreeable. At Aldershot the Engineers were perfecting some wonderful machines which were kept entirely hidden, like those that were being built in Scotland. These machines navigating the air must be directed by skilled drivers, and it was necessary that the training of such men should be encouraged by public subscription, so that we might have a trained body of men to use such machines, which were as essential for England as they were for Germany or France.

Mr. Roger Wallace, K.C., in responding, said that those who had assisted in achieving success for the automobile movement in this country were now united in an endeavour to develop aerial flight. He was quite certain that those connected with other movements having the same object would work in co-operation with the Aero Club, which had formed a new branch called the Aero Club League, which league would enable them to absorb any of the bodies which did not wish to pay large subscriptions. He announced that the whole question of aviation is to be discussed at a meeting shortly to be held at the Aero Club. This would be attended by

representatives of foreign clubs, to deal with the question of forming new aeronautic rules in this country.

The toast of "The Visitors," proposed by the Hon. C. S. Rolls, was responded to by Sir Edward Seymour and Mr. Manville.

THE new registrations at Somerset House include that of the British Aeroplane Syndicate, Ltd., with a capital of £5,000 in £1 shares.

THE three members of the Aero Club, Mr. John Dunville, Mr. C. F. Pollock and Mr. Philip Gardner, who left Battersea at 9.15 on Friday evening in the former's balloon *Banshee*, descended safely near Crailsheim, in Germany, at 10.15 on Saturday morning, a distance of 500 miles having been covered in thirteen hours. The voyage was remarkable for the great speed attained during the first few hours. The coast near Dungeness, distant sixty miles, was reached in sixty-six minutes, and the Channel crossing of thirty-five miles occupied only thirty-seven minutes. Mr. John Dunville was competing for the Northcliffe Cup, and unless a longer distance is covered by a member of the Aero Club before the end of the year it will become his property.

THE Aeronautical Society of Great Britain has acquired its own experimental ground, which will be opened for the use of members at an early date. The site selected, near Dagenham Station, on the London, Tilbury, and Southend Railway, is well suited for aeronautical work, as it measures some half-mile in length, by about the same distance in width. The greater part of it is flat, and suitable for experimenting with full-sized machines, but on a portion to the south there are steep mounds, some 53 ft. high, well fitted for testing models of all kinds. Sheds to accommodate full-sized machines will be erected, and as soon as funds are available a properly equipped scientific establishment, containing whirling table and other aeronautical testing apparatus, will be provided. This will help the Society to develop its objects, and it is greatly to be hoped that the efforts now being made to bring aeronautical science to the position which it should occupy in a country like this will meet with the fullest support from the general public.

AUTOMOBILE ACCIDENTS.

ON Sunday a car skidded while passing another proceeding in the opposite direction at the bottom of Dale Hill, Pycombe, about five miles from Brighton. It overturned, and all the occupants were thrown out, one sustaining a severe scalp wound.

A MOTOR-CAR and a horse came into collision on Friday near Harlow and the driver of the latter was thrown. After medical attention from Dr. Howard, who was in the car at the time, the man was removed to the Bishop's Stortford Cottage Hospital suffering from a fractured jaw.

THE inquest on the bodies of John Darker, of Coalville, and his wife, Emma Darker, has been concluded. The circumstances of the accident have already been reported. The jury found that the collision was caused by want of care on the part of Darker in not allowing sufficient room for the car to pass, and that Mr. Booth was using reasonable care when driving. They drew the attention of the authorities to the dangerous state of the road at the spot. Mr. Charles Booth intimated his intention of compensating the orphans.

MR. SAMUEL GREENLEES was run over in the Strand, London, on Tuesday by the Marchioness of Donegal's motor-car. Her ladyship was in the vehicle at the time, and caused Mr. Greenlees to be conveyed in the car to King's College Hospital, where he is detained, suffering from severe injuries to the head.

"POLICE CONTROLS."

THE Moortown trap, near Leeds, has again been revived by the local police.

THERE is a police trap on the Harrogate and Arthington road, at Weeton. It is a quarter of a mile in length.

THE Kingston police have been supplied with electric flash lamps for signalling when timing motor-cars which may be exceeding the limit after dark.

THE police are stopping motorists in Twyford, and have lately issued several summonses against them for dangerous driving.

FROM the Lynwood Road to the Gloucester Road, Reigate, the police have a measured distance of 294 yards along which motorists are frequently timed.

AMONG the traps in regular operation in the neighbourhood of Haywards Heath are those between Bolney and Newtimber, Pyecombe and Bolney, Cuckfield and Pyecombe, Cuckfield and Clayton.

A TRAP is reported at Burnham, between Slough and Maidenhead.

THE police are generally active in the Eltham district at the weekends.

IN spite of the fact that the taxicab is to be seen in almost every street in the City and central parts of London, it is almost a rarity in the outlying localities. Just as it has rapidly sprung into public favour within this limited area, the smart private-looking taxicab would quite as successfully establish itself in other Metropolitan districts, to say nothing of its possibilities in many of the busy provincial towns. Incidentally we may mention that an exceptional opportunity of purchasing good new taxicabs of the Leader type at a very low figure is now being offered by the London and Paris Exchange Motor Agency, Ltd.

FORTHCOMING EVENTS.

DECEMBER.

23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.
24th.—30th.—Heavy Motor Vehicle and Aeronautical Display at Paris.
31st (Th.).—Entries close for Grand Prix of A.C.F.

JANUARY, 1909.

1st (F.).—Anniversary of the Motor Car Act, 1903, coming into operation.
7th (Th.).—Annual Dinner of the Yorkshire A.C. at Leeds.
8th (F.).—Nottinghamshire A.C.'s Annual Dinner.
Mr. C. Y. Knight will lecture on his engine to the Manchester and District Motor Trades Association.
14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
16th–25th.—Brussels Motor Show.
21st (Th.).—Annual General Meeting of the Southern Motor Club.
22nd–30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
23rd (S.).—Annual Dinner of the Coventry Motor Club at the Craven Arms Hotel, Coventry.
26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.R.H. Prince Francis of Teck will be among the guests.
4th (Th.).—Annual Dinner of the Southern Motor Club.
24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
Motor-Car Show at Barcelona.

ROAD REPORTS.

WEMBLEY.—The Middlesex County Council is appealing to the Local Government Board to restrict the speed of motor-cars through Wembley, on the main road from London to Harrow, to ten miles an hour.

HEMEL HEMPSTEAD.—The Town Council of Hemel Hempstead has scheduled several local thoroughfares in view of an application being made for a ten mile speed limit for motor-cars.

BEXHILL.—The Bexhill Town Council has resolved to apply for an Order restricting the driving of motor-cars in Barnham Road, Bexhill, to a speed of not more than five miles an hour.

BUSINESS NEWS.

WE are informed by the British Petroleum Company, Ltd., that after February 28th, 1909, the Shell motor-spirit "gold seal" bonus offer will no longer hold good.

FROM Messrs. Donne and Willans, Ltd., of Gillingham Street, Victoria, S.W., comes a copy of the 1909 catalogue of the Piccard-Pictet cars. This is a very handsomely got-up list and gives full particulars and illustrations of the various types that are being turned out for the coming season. These include 12, 18 and 28-h.p. four-cylinder and 28-h.p. six-cylinder, all fitted with live axles. The Piccard-Pictet vehicles are amongst the highest grade productions of Switzerland and comprise several interesting features, prominent amongst which is the method of fixing the engine and gear-box in the frame.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27–33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, DECEMBER 26, 1908.

[No. 512.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

PRIZE COMPETITION.

AS announced last week, we offer a prize of two guineas for the best original short story of motoring interest suitable for publication in the *M.C.J.* The story should be between 1,000 and 1,200 words in length, and the main incident should, of course, centre about the automobile.

The latest date for submitting the MSS. will be the first post on Saturday, January 16th, 1909, and the award will be notified as soon as possible after that date, the Editor's decision being final.

With reference to the stories which do not win the prize, the right is reserved to publish any which we may deem suitable, making payment at our usual rate of remuneration.

All MSS. should be forwarded addressed to the Editor, *M.C.J.*, 27-33, Charing Cross Road, London, W.C., the envelopes being marked "Short Story" on the top left-hand corner.

COMMENTS.

AGAIN we take the opportunity of wishing our readers a Merry Christmas and a Happy New Year. The past year has had its vicissitudes, and the trade has not been free from trouble, but, on the whole, the motor movement has advanced and the position of the motor-car has become even more fully established as a factor in the social and the commercial life of the community. Parliamentarians have lately been active against the motorist, but, on the other hand, there are a great many enthusiastic motorists in

both Lords and Commons who believe that the better policy to pursue is that advocated by the Hon. Arthur Stanley, M.P., in the *M.C.J.*, when he suggested that things should remain as now and that there was no urgency to promote legislation. With regard to the trend of the trade, our columns have borne witness to the growing desire on the part of owners to possess cars of smaller power than were popular a few years ago, and the favour with which the less high powered vehicle is now regarded is all to the good. The discouragement of road racing by the various representative organisations of automobilists has also conduced to a better regard for drivers in many centres, and the most virulent and violent opponents will surely begin to realise that it is but a very small minority who bring discredit upon the whole number of those who own motor-cars.

The A.A. in America.

INTERESTING comment on the international character of the automobile movement comes in the news from an American correspondent, and confirmed by inquiries in London, that the Automobile Association will have a stand at the forthcoming Motor Car Show in New York city. The motorists of the United States, who are being subjected to much persecution at the hands of the police, aided and abetted by the magistrates, have sought remedies in many directions, and we have no doubt they will be interested in the methods by which the Automobile Association has been able to assist its members in the moderation of their pace to legal requirements. Apart from that important educational phase of the matter, however, the enterprise of the A.A. is notable, for it will be the first occasion on which a motoring

organisation in the Old World has sought to teach the New World on the other side of the Atlantic. While referring to this Association we may mention that in accordance with its custom there will be no scouts on duty on the roads upon Christmas Day, but, of course, they will be out as usual on Boxing Day. The fourth annual dinner of the Automobile Association has been fixed for Wednesday, March 24th, and will, as usual, take place at the Hotel Cecil, London. The second annual dinner of the Northern Section of the Automobile Association will be held at Manchester early in February.

Rules for Passers-By.

SEVERAL suggestions of a more or less humorous nature have been made with reference to the duties of pedestrians wishful of safety when crossing the roads and avoiding the automobiles that now are found along all the leading thoroughfares. A code which has reached us from a Transatlantic reader has some proposals which are not likely to be seriously regarded, but which may provide a little seasonable reading at the festive period of the year. Briefly set forth the rules are as follows:—

- 1.—Pedestrians crossing streets at night shall wear a white light in front and a red light in the rear.
- 2.—Before turning to the right or left they shall give three short blasts on a horn at least three inches in diameter.
- 3.—When an inexperienced automobile driver is made nervous by a pedestrian, he shall indicate the same, and the pedestrian shall hide behind a tree until the automobile has passed.
- 4.—Pedestrians shall not carry in their pockets any sharp substances which are liable to cut automobile tyres.
- 5.—In dodging automobiles, pedestrians shall not run more than seven miles an hour.
- 6.—Pedestrians must register at the beginning of each year and pay a licence fee for the privilege of living. There shall be no rebate if they do not live through the entire year.
- 7.—Pedestrians will not be allowed to emit cigarette smoke on any thoroughfare in an offensive or unnecessary manner.
- 8.—Each pedestrian before receiving his licence to walk upon a highway must demonstrate before an examining board his skill in dodging, leaping, crawling and extricating himself from machinery.
- 9.—Pedestrians will be held responsible for all damages done to automobiles or their occupants by collision.

The Gate Controlled Change-speed Gear.

DURING the few last weeks, when a large amount of space was devoted, in connection with the Shows, to a description of the features of the many new cars that are being introduced for the 1909 season, frequent reference was made to what has come to be known as "the gate change." This system of controlling the change-speed gear has within the past year or so become almost universal on high-powered cars, and users of such vehicles are doubtless well acquainted with its method of operation and its advantages. Now, however, that it is being adopted on automobiles of medium power, and is consequently being introduced to a wider circle of the automobile world, the article we print on another page of the present issue,

describing its main features, will ~~undoubtedly~~ prove useful and instructive to many of ~~our readers~~.

The Gate Change in France.

due to the fact that the French, while not overlooking the simple method of control it affords, have kept to the front the main idea for which the gate-controlled change-speed gear was introduced, that of arranging the sliding train in two or more sets in place of one, as formerly. The advantage of the system lies in the fact that to change from one speed to another it is, by the modern arrangement, not necessary to cause the pairs of gear wheels of the different speeds to pass through one another ere reaching the desired one. Hence it is that in speaking of the change-speed gear, the French refer to it as being of the one, two, or three *train balladeurs* type, as the case may be.

The Storage of Petrol.

As we were recently able to announce, the Home Secretary has had under contemplation for some time the appointment of a small Departmental Committee to enquire into the sufficiency of the present regulations relating to the storage, use and conveyance of petroleum spirit. It has now been definitely decided that this Committee shall be formed, and the names of the members have just been announced. Sir Henry Cunynghame, K.C.B., will be chairman, a position with which he is perfectly familiar, having been secretary of the Parnell Commission, the Behring Sea Arbitration, and other important public investigations. His colleagues will be Sir Boverton Redwood, who is official adviser on petroleum to the Admiralty and to the Home Office and also consulting adviser to the Corporation of London. His publications on the subject and his interest in motoring are also well known to our readers; Major Cooper Key, His Majesty's Chief Inspector of Explosives, and Mr. James Ollis are the other members of the Committee. The latter gentleman is the Chief Adviser of the Public Control Department of the London County Council, and has been mainly responsible for the policy of that body with regard to the many warnings that have lately been issued to the owners of garages and others in connection with the disposal of petrol in the sewers, &c. Major T. H. Crozier will be the secretary to the Committee, whose headquarters are at the Home Office, Whitehall.

We understand that the intention of Mr. Gladstone in appointing a small expert Committee has been to secure, not only a thorough, but also an early report.

Obstructions on the Road.

ON Wednesday of last week the monthly meeting of the Motor Union of Great Britain was presided over by Mr. W. Ballin Hinde, when a satisfactory financial report was presented and many applications for legal assistance which had been considered by the Committee specially dealing with that section of the work of the Union were confirmed. The Highways Protection Committee has also been doing some very useful work in connection with dangerous bridges, the obstruction of motorists on the road by drivers of horse-drawn vehicles, and in connection with the Lights on Vehicles Act. Mr. Hinde drew attention to the numerous cases of obstruction by drovers in charge of animals, and the Rev. F. W. Hazzard-Short, of Dartford, suggested a petition being sent to the County Council in favour of cattle drovers carrying lighted lamps. This suggestion was endorsed by the Committee to the extent of their agreeing to go thoroughly into the point raised. The policy of motorists has hitherto been to act mainly on the defensive—a work which will be materially assisted if, in some directions, they go further and assume an attitude of challenge to those who claim the whole of the roadway for themselves.

Local Centres of the Auto Cycle Union.

QUIETLY, but none the less thoroughly, the organisation of motor-cyclists has been proceeding under the auspices of the Auto Cycle Union. The latest development in connection with that organisation is the preparation of a scheme for the recognition of local centres which shall stand in much the same relation to the central body as do the affiliated motor-car clubs to headquarters in London. The draft plan suggests the division of the country into eleven territorial divisions, that for the Metropolis being within a radius of twenty miles of Charing Cross Road, at number 27-33 of which, we need scarcely remind our readers, are the offices of the M.C.J. Each district will have representation on a general council, and the Auto Cycle Union will provide it with funds on a scale to be determined. In view of the large number of motor-cyclists in the country their organisation into a really strong and powerful body is much to be desired, and if the new proposals lead to such a result they will well deserve the care which has been bestowed upon their preparation.

Motors and Manœuvres.

FOUR and twenty motor-'buses have just demonstrated anew their value in the mobilisation of the troops. They were driven out from their usual London routes, the other day, as far as Warley Barracks, Brentwood. From thence they conveyed the 1st Norfolk Regiment to Shoeburyness, where manœuvres were carried out in connection with the defences of the Thames Estuary. Narrow and hilly were the roads as the 'buses went along, proving that, if they have supplanted the 'bus horse in the London streets, they can also render similar service in times of emergency. Altogether the military authorities were well satisfied with the experiment; but now a Territorial officer writes to point out that the transportation could have been done more quickly by train.

Trials of 1909.

ALREADY the Scottish A.C. has determined upon the dates of its Trials for 1909, which will doubtless be largely supported by members of the motor-car trade, who have recognised in the past events north of the Border an opportunity for real commercial advantage, as well as for testing the capacities of their particular vehicles. Now we learn that the Irish A.C. propose to hold their Reliability Trial in the last week of May or the first week in June. It is intended that this shall extend for six

running days, and there will also be included tests for reliability, speed on hills, and petrol consumption. In addition to the prizes available for the cars and their owners who take the premier positions in the event, a team competition will be included, gold and silver medals being awarded for the best consistent running of any team engaged in the trials.

Cars in London.

IN our last issue we referred to a census which has just been taken of the number of automobiles registered in the country. Already substantial additions have to be made to the lists previously published, those giving the figures up to September 30th. Between that date and the end of November applications were received by the L.C.C. for the registration of 997 motor-cars, 26 heavy motor-cars, and 133 motor-cycles, while in the same two months 3,308 drivers' licences were issued. This brings the total registrations in London to 36,044, while no fewer than 92,912 drivers' licences have been issued since the passing of the present Motor Car Act under which we move and pay our fines. From

introduction of checks which it is hoped will prevent this in future. It may be of interest to know that before being placed on the cabs the taximeters are tested at the National Physical Laboratory at Kew, and at intervals unknown to the men beforehand the meters are examined on behalf of the Scotland Yard authorities. The cabmen are feeling the effects of competition, while the Protection and Share-out Club, which was started last spring to pay the fines of members summoned to the police courts, has had its funds heavily drawn upon.

Municipal Encouragement.

THE annual dinner of the Sheffield and District A.C. was an important function, several leading representatives of local public bodies being present to testify their interest in automobilism. Among the speakers were the Mayor of Rotherham, the Town Clerk of Sheffield, and the General Manager of the Sheffield City Tramways. Mr. R. M. Prescott, the Town Clerk of the cutlery centre, is himself a motorist, and believes that but for the development of the automobile industry during recent

An Old Time Motor Vehicle.—Gurney's Steam Carriage on the Way to Bath in 1829.

these figures it would appear that, despite the pessimism of many engaged in the trade, a fair amount of business is passing—a state of things revealed also in the show rooms devoted to cars that are not quite new. The L.C.C. is about to apply to the L.G.B. for an Order assigning to the Council a further index mark. This, they suggest, should be LD, the limit number of four figures under the marks A, LC, and LN having been reached.

Motor Cabs.

THERE are now 2,200 motor-cabs plying for hire in London, and several companies are preparing to place a large number of new vehicles upon the streets early next year. In view of this the variations with regard to the distance registered by the taximeters, to which we referred last week, become a matter of considerable importance, and we are glad to see that it has been raised by Mr. G. Gooch, M.P., in a question to the Home Secretary. Mr. Gladstone acknowledges that in some instances taximeters have been falsified, but adds that the Public Carriage Department at New Scotland Yard has under consideration the

times there would have been a great deal more unemployment than is now the case. He stood for a fair and reasonable use of the roads, and demanded the right of cars on any road in the country with any other sort of vehicle. Mr. A. F. Fearnley, who is associated with the Sheffield City Tramways, declared his readiness to always do what he could to assist motorists, and urged that authorities should be persuaded to adopt the Light on Vehicles Act as an advantage to all classes of traffic. Superintendent Bielby also spoke, mentioning that the West Riding County Council had adopted a by-law compelling vehicles in the district to carry a rear light. During the evening the prizes which had been won during the year were presented by the chairman, Mr. C. F. Coupe, and the toasts of the Royal A.C. and the Motor Union were given, responses being made by Messrs. J. W. Orde and Rees Jeffreys, respectively.

WHEN one of the wheels of a car is to be removed it is not sufficient to jack up that end of the axle; a box or other support of sufficient strength should be placed under the axle to carry the weight in case the jack should be knocked over.

GOSSIP FROM PARIS.

The Exhibition Question.

The revolt, the revolution, the evolution, or whatever it should be called, taking place in the French automobile world is calculated to lead to consequences which were far from being foreseen only a few months ago. The most striking symptom of the situation is perhaps the refusal of the Automobile Club Committee to follow the indications of the leading French automobile manufacturers, who, after boycotting the Grand Prix, would suppress the annual Salon. At least they do not want any more Salons such as have hitherto been organised by the A.C.F. It is contended that exhibitions have been got up more to attract the loiterers from the Boulevards and excursionists from the provinces and foreign countries than the people interested in the progress of automobilism, and especially the buyers. An exhibitor who has joined the movement against what he called "that sort of thing" was, he thinks, justified in declaring that "in the automobile show the cars were treated as a *quantité négligeable*." "The automobile show for the automobilists!" was his cry. The exhibitors do not see the fun of going on paying the piper for the pecuniary and moral advantage of the A.C.F. The revolutionists or evolutionists do not deny it will be advisable to hold an annual or biennial exhibition, but it should, they contend, be organised on the co-

A Reminiscence of M. Henry Farman's Flight from Chalons-sur-Marne to Rheims.

operative system by the exhibitors themselves, and not by the Automobile Club for its own advantage. That is just the hitch. The A.C.F. and its "Société d'Encouragement pour le Développement de l'Industrie Automobile en France" are determined to go on "encouraging" the manufacturers, who declare they do not want any more encouragement, especially of the description they have had recently. They have outgrown their swaddling clothes and can run alone. However, whether the firms who signed the round robin undertaking not to exhibit in any automobile show next year like it or not, the Automobile Club is determined to organise its Salon. This decision was taken by thirty-four votes against eighteen. But those figures are eloquent in a sense which is not apparent from the majority of sixteen votes in favour of the maintenance of the official organisation. Of the thirty-four persons who secured the victory of the A.C.F. only ten are exhibitors, and the eighteen persons forming the minority comprise the chiefs of automobile firms whose annual output is more than 50 per cent. of the motor-cars made in France.

The Grand Prix Race.

Do you think the forty cars will be entered for the Grand Prix before the end of the month? I have put that question to every automobile maker I have met since that minimum was fixed as a *sine qua non* condition for the holding of the race. The replies have not been that unanimous and categorical "No" which I had

almost expected. Those who had boycotted it naturally consider the International competition will not be "great" without them. Other people may hold another opinion on that point, especially as there are some very important French firms which refused to join the boycott and have already entered cars for the race. Even some of the abstentionists are not quite sure their example will be followed so generally as to prevent the inscription of the prescribed minimum of cars. The 130 mm. cylinder bore opens the door of the Grand Prix to a good many makers who may perhaps be even encouraged to enter their vehicles by the abstention of the seventeen big firms. The partisans of the race are, moreover, moving heaven and earth to encourage the entry of racing cars, and there is still the unknown quantity of the attitude foreign makers will assume. Of course if the foreign contingent is sufficiently large to make up for the French abstentions the French will in the case of one of the foreigners carrying off the prize pretend there was no honour in such an easy victory. But was not the consciousness of the probability of another defeat among the unconfessed reasons which induced the majority of the French leading automobile manufacturers to boycott the Grand Prix? At any rate it would be curious to see the French Automobile Club constrained to organise and preside over a sporting event which would profit chiefly foreign competitors.

Wilbur Wright's Great Flight.

Wilbur Wright has once more raised the enthusiasm of the world by a flight of 61½ miles duly controlled and certified by the officials of the French Aero Club. It was a great exploit from every point of view, but not so much for the distance as on account of the marvellous manner in which he handled his machine in a comparatively high wind. The American aviator had previously remained in the air even with a passenger with him on board his aeroplane for more than an hour, which was sufficient to demonstrate he could fly so long as no accident happened to his motor and his stock of *essence* was not exhausted. And that fact was demonstrated again by his record flight being interrupted only by the tap of his petrol tank getting closed. He might and would have continued flying for another couple of hours had that accident not prevented him and if the wind had not become too strong. The same thing may be said of Henry Farman, who has now replaced his Antoinette motor by the new air-cooled Renault engine on which he hopes to be able to rely. He has already remained in the air three-quarters of an hour, and was only brought to the ground by a *panne* of his motor. Wilbur Wright's machine is considered by many people superior to that of his competitor, and it may be so in some respects. But in one particular at least it is inferior; it requires a catapult to enable it to rise from off the ground, whereas that of Farman and those of the French aviators have wheels and can start from any place where the ground is sufficiently even for a bicycle to travel over. For touring it is an immense advantage not to be obliged to wait for the arrival of a catapult to throw the machine into the air.

An International Aeronautical Conference.

How people would have laughed only fifteen months ago if anyone had been bold enough to predict that before the end of 1908 the Governments of Europe would be thinking seriously of fixing the international status of steerable balloons and aeroplanes. But facts are often stranger than fiction. The progress made within the last year in aerostation and aviation has been so extraordinarily rapid and great that last week, on the proposal of M.M. Pichon and Barthou, Ministers of Foreign Affairs and Public Works, the French Ministry, at a Cabinet Council held under the Presidency of M. Fallières, decided to invite the powers to an International Conference in Paris entrusted with the study of the international *régime* to which aerial vessels of all sorts should be subjected. The invitations are to be sent out without delay, but the date of the meeting of the conference has not yet been fixed. Probably before it assembles still more striking exploits will have been achieved both by steerable balloons and aeroplanes, demonstrating the advisability of establishing rules for international traffic by the aerial highway.

MARNEY

THE GATE CHANGE.

A NON-TECHNICAL EXPLANATION OF THE SYSTEM.

ALTHOUGH what is known as the "gate change" system of manipulating gearing to alter the ratios of power to speed in motor-cars is now generally adopted, the precise nature of the advantages thereby obtained, and the way in which its working differs from the ordinary control by notched quadrant, may not be clearly defined in the minds of many who are accustomed to drive cars equipped with one or other of the varieties named. In spite, therefore, of the fact that some manufacturers take it for granted that everybody is thoroughly conversant with the why and wherefore of the subject of these notes, some going so far, indeed, as to print in their catalogues that "the advantages of this design are too well known to need enumeration," I still propose to chronicle them here.

Although, no doubt, the main object of the engineer who first applied the grid or gate sector to the change-speed control of an automobile concerned more directly an improvement in the design of the gear-box and its contents than any benefit which might also accrue in the manipulation of it, I think there is but a small minority of motorists who prefer the trigger lever work

Fig. 1.—Elevation and Plan of Single Lever "Gate" Control.

Fig. 2.—Elevation of Ordinary Notched Quadrant Lever.

ing backwards and forwards along a notched quadrant. However, no matter exactly what the designer had in mind, the fact remains that both mechanically, as an advance in construction, and conveniently, as an aid to changing gears surely and easily, the gate system has working as well as merely "talking" points to commend it. Mechanically, the gate has reduced the over-all length of the gear-box considerably, which, besides spelling a reduction in weight and affording it a general appearance of compactness, also means short shafts. Long "whipping" shafts used to be the bugbear of a good number of the old-fashioned gear-boxes, causing the bearings to seize and wear out quickly, as well as making the pinions mesh badly, and consequently grind and groan. Mechanically, also, the gate has made possible a more certain method of positively locking the gears in mesh or in neutral, whilst at the same time the whole action is rendered more robust and wear resisting.

From the driver's point of view it is something to be able to slam the change-speed lever forwards or backwards, as the case may be, safe in the knowledge that he has no notches to "feel" and possibly to over-run. It is something more that, with an upright and central position of the lever, he can get straight-away into any speed; no running the gauntlet of gears he does not want before he can arrive at the "speed" he requires. Reverting to the point of compactness, those who remember the lengthy gear-boxes that occupied a very consider-

able part of the total length of the chassis of some well-known cars of a few seasons ago, find it somewhat difficult to realise that the present comparatively midget cases can contain sets of gears every bit as strong and serviceable as their predecessors. Yet the fact remains. That other means of saving longitudinal dimensions in gearing exist most of us are aware; there are, for instance, certain "always in mesh" ideas, while another system

Fig. 3.—Sectional Plan View of Gate-Controlled Gear-Box.

that can be adopted to save space is by letting the shafts carrying the pinions approach in such a manner as to allow the teeth to come into mesh radially; yet another method is the sun-and-planet or epicyclic gearing, both of which last-mentioned systems possess excellent features and work well when properly applied.

All gate-change gears do not necessitate a transverse motion of the hand lever; in the Vinot and De Dion practice, for example, we find a vertical gate with the lever moving fore and aft in one plane, the depression of a plunger, when two of the gears are required, making the hand lever actuate the lower of two selecting levers that control the striking forks. With these exceptions, however, there is but slight difference in the design, generally speaking, of gates and selecting levers; some, it is true, have only two sliding rods, whilst others have three and even four, and in certain designs, also, two change-speed levers are employed, but this latter practice is now confined mostly to commercial vehicles, and in my opinion is somewhat out of date.

To define briefly the essential difference between the gate control and the ordinary notched segment, it may be said that the former controls two or more sliding rods projecting from the gear-box, which in turn actuate two or more sleeves carrying spur pinions, by means of forks that rest in recesses turned in the sleeves, whereas the latter controls merely one sliding rod to which its lever is permanently linked. In the case of the gate lever, too, it is not permanently linked to the sliding rods, but actuates one of them at a time, through the intervention of selective levers, after automatically leaving the other, or others,

Fig. 4.—Sectional Plan View of the Old-Style Single Sliding Sleeve Gear-Box.

in a neutral position. In the operation of the horizontal grid or gate gear, it is the transverse movement of the hand lever which disengages it from one of the selective levers and connects it to another.

If this explanation is clear, it will be seen that, whereas with only one sliding rod coupled to a lever working in one plane the whole range of gears, forward and reverse as well as the inter-

mediate neutral positions, follow necessarily in one direction (unless some complicated additional mechanism be introduced), with two or more sliding rods it is possible to break up the movement longitudinally by dividing it amongst a plurality of gear sleeves; and that, further, the grid enables these sleeves to each have a central neutral position common to two speeds, and to further divide the motion by making one speed fore and the other aft of the neutral point on each gear sleeve. It is, therefore, easy to understand to what a great extent the over-all dimensions of a gear-box can be thus reduced in comparison with the old-fashioned type, especially when the additional fact is borne in mind that, owing to the reduction in the length of the shafts, it is possible to do away with the extra amount of space entailed by intermediate bearings, and yet have a perfectly rigid and successful range of speeds, whether on the direct drive or when the "back gear" is in operation. A. E. S. C.

MOTOR REGULATIONS IN FRANCE.

M. BARTHOU has not yet presented to Parliament his Bill for the reform of the legislation relating to traffic of all sorts on the highways of France, but he has publicly renewed his promise to do so without unnecessary delay. In a letter addressed by him to a sport-

The Horch Ambulance Car built for the Volunteer Life Saving Society in Munich.

ing journal which had questioned him on the subject the Minister seems to make an unfair distinction between the drivers of automobiles and those of horse-drawn vehicles, whom he describes as "the normal users of the road." Are not motorists and cyclists just as "normal users of the road"? It certainly is not because they are abnormal users of the road that all the motorists in France are obliged to pass an examination before having the right to take the steering wheel, but because it requires more skill to drive an automobile than a wagon, though it is undeniable it is easier and more simple to put on the brake and stop an automobile than it is to master a restive horse. It would, nevertheless, as M. Barthou says, perhaps be excessive to require the possession of a driver's licence by every one entrusted with a horse on the road, but the promised reform will not give satisfaction if, as the Minister's letter seems to indicate, the chauffeur will, in case of accident, be liable to the suspension of his driving licence, and, in certain cases, to its complete withdrawal, while the driver of a horse-drawn vehicle, whatever the accident he may have caused, will be at liberty to take out his team the very next day and continue to create obstructions on the highway by his incapacity, carelessness, or antipathy to motor-cars.

MAJOR F. LINDSAY LLOYD, late of the Royal Engineers, has been appointed manager and clerk of the Brooklands Motor Course. He took up his duties on Tuesday last.

THE SOCIAL WHIRL.

THE King made good use of his car while at Brighton, which he left on Monday morning. Not only were daily runs taken along the Front, but trips to Rottingdean, Seaford and Worthing were of frequent occurrence.

THE Hon. Stephen Coleridge, in an after-dinner speech to the members of the Welsh A.C., recounted an amusing experience he had had near Salisbury. He had been given a hint by a friend to look into a certain pigsty on the road, and when he did so he found a constable lying down. He addressed the hedgehog—told him that his watch had stopped, and ask him the time—a procedure which completely overwhelmed the recumbent policeman.

THE Bishop of Chichester is one of our motoring ecclesiastics. He also found the car a useful text for an after luncheon speech at Burgess Hill a few days ago. In the course of his remarks he suggested an advantage of the automobile which I do not remember to have been instanced before, viz., that he could have complete rest, whereas on railway journeys he was obliged to talk, and "as a bishop I am tired of talking," remarked his Grace. The disadvantage, however, was that, as much more could be done with the aid of a car than without, more was expected of a motoring bishop than of those whose activities were limited by the range of a carriage and pair.

BARBADOES is being visited by many motorists, all of whom seem to return with good accounts of the island—so far as its hospitality to those who drive cars is concerned. The roads, although white and dusty, are very good with fine firm surfaces. Recent visitors include Sir Frederick Treves and Dr. Mortimer Johnson, of Streatham, the latter gentleman taking with him the 10-12-h.p. Humber car upon which he is seen in the illustration, from a photograph taken at Hastings, Barbadoes, on another page. He discovered in Bridgetown a firm of engineers with a charging plant for accumulators, and since his return two other vehicles similar to his own have been imported on the island. He advises anyone who may follow his pleasant example to have a magneto fitted before going and to take as many spares as possible. Such things are at present difficult to obtain, but this trouble will doubtless disappear as the popularity of the West Indies grows among motorists. Dr. Johnson's friends were delighted with the silence, smooth running and ability to negotiate hills shown by his car.

ACCORDING to the latest bulletin of the White Steam Car Company, the concern is going strongly into the motor ambulance business, and has already supplied vehicles to the United States Army and Navy. They should do well on this side, for Mr. Frederic Coleman, who looks after the White steam car, was, when in San Francisco, an acknowledged expert in such matters. He frequently rode with old Denis Kearney, the driver of the Doctors' Daughters' Ambulance, a pair-horse ambulance with rubber tyres, which had been presented by funds raised by an association of doctors' daughters. They had fixed to the front of that light, speedy ambulance, pulled by its team of splendid horses, a gong which was similar in character to the gong now used on our London fire engines. No other vehicle was allowed to use such a gong, and once they had the rubber tyred wheels on the tram-car metals no jars occurred. Many a life Mr. Coleman has known to be saved by such rapid and easy transit—now to be accelerated by the adoption of the automobile.

THE formal opening of the Sussex Motor Yacht Club House, in Middle Street, Brighton, took place on Saturday, when the Rear Commodore, Lieut. C. Sumner, presided over a large company, which included the Mayor of the town. The new home of the Club should prove of great value not only to those engaged in motor yachting at Brighton but also to the seaside resort generally.

LOLLIUS.

SOME NEW PETROL-ELECTRIC VEHICLES.

A NOTEWORTHY feature of the motor industry during the past year has been the appearance of several petrol-electric vehicles, in which the power developed by the engine is transmitted electrically instead of mechanically to the road wheels, the usual clutch and change-speed gear being thus dispensed with. Some of the systems, notably the Auto-Mixte—which is being introduced in France as the G.E.M.—and the Mercedes-Mixte have already been dealt with in these pages. In addition

Fig. 1.—The Krieger Petrol-Electric Motor-Cab.

to these, however, the Krieger Company have brought out an improvement on their original design, while newcomers in the petrol-electric field of automobiles include the S.F.A., the Lavo, and the Balachowsky-Caire, some brief particulars of which are appended.

Dealing first with the Krieger petrol-electric cars (Figs. 1 to 4), which, in addition to electrical carriages, are now being turned out by La Compagnie Parisienne de Voitures Electriques Procédés Krieger, of Boulevard Valmy, Colombes, France, the motive power is supplied by a four-cylinder petrol motor, which is located in the forepart of the frame, as usual, and works constantly at full power. It is connected through a flexible coupling to the armature—which forms the flywheel—of a special dynamo. The latter is of the self-regulating type, designed to utilise the

Fig. 2.—Chassis of Krieger Petrol-Electric Car.

whole of the power developed by the engine, either in increased speed or greater driving effort, according to the nature of the road over which the car is being driven. It is provided with a differential compound winding, a few demagnetising turns in series with the armature opposing the shunt coils. Two electrical motors are provided; these are coupled in parallel or in series and work at constant power, but variable speed, driving the two

front wheels—which thus act both as steerers and drivers—through enclosed helical gearing. The speed is regulated by a pedal connected with the controller. The latter is mounted on the dashboard, and comprises a special contact for the dynamo and a reversing switch, the latter being controlled by a small lever on the dashboard. By gradually pressing down the pedal, the speed of the engine, and consequently that of the car, is progressively increased, while by removing the foot therefrom the current is diverted from the motors and the engine slowed down. A further variation in speed is obtained by a lever which alters the degree of excitation of the dynamo. The number of contacts has been reduced to two—one for forward running and one for reverse—and the current is diverted whenever a change has to be made from one to the other. Under no circumstances, however, is the electrical circuit totally interrupted. Two sizes of chassis, for cabs, town carriages and pleasure vehicles, are being made, of respectively 12–16-h.p. and 16–26-h.p.

The principle of the S.F.A. petrol-electric vehicle recently put on the market by the Société Française d'Automobiles De Poorter, 60, Rue Lemercier, Paris, is very similar to that of the Auto-Mixte vehicles—that is to say, under normal conditions the petrol engine drives the rear axle of the car direct through a universally-jointed shaft and bevel gearing. On starting, however, or on any occasion when the load on the engine is greater

Figs. 3 and 4.—Elevation and Plan of Krieger Petrol-Electric Car.

than it can meet, a certain amount of reserve power is furnished by a small set of accumulators carried on the car. On the other hand, when the driving of the vehicle does not absorb the whole of the power developed by the engine, as when on down grades, the excess is employed in charging the battery. The general appearance of the vehicle is similar to the usual design of petrol car. Interposed between the engine and the cardan shaft is an electric machine specially designed to act either as generator or motor. When a hill is, for example, encountered, the engine, and consequently the generator, will slow down, a corresponding fall taking place in the e.m.f. at the brushes. As at the terminals of the battery there exists a constant electric pressure, a discharge of current to the dynamo takes place, and the latter, acting as a motor, adds its power to that of the prime mover. One of the features of the De Poorter system is that the current supplied by the accumulators is limited to that absolutely necessary. The discharge current increases the excitation of the dynamo, and reduces the difference of potential at the brushes, thus restricting the discharge from the battery. As the speed of the engine increases, the voltage at the brushes rises, sending a charge to the accumulators and at the same time reducing the dynamo excitation. In practice, the running of the car is a constant series of changes in the character of the electrical machine, which at one moment

is running as a generator and the next as a motor, the changes all taking place automatically and independently of any action on the part of the driver. The system is exceedingly simple, and, as compared with an ordinary petrol car, not only enables the usual change-speed gear to be dispensed with, but permits the engine to be started from the seat by means of the battery, which also furnishes current for the lighting of the vehicle. Three models are being made—10-12-h.p., 16-20-h.p., and 30-40-h.p.; in the first the engine is of the two-cylinder type, and in the others four-cylinder.

The "Lavo" petrol-electric car (Fig. 5), is being made by La Société l'Energie Electro-Mecanique, of Rue Delaunay, Suresnes, near Paris. In this vehicle the motive-power is furnished by a four-cylinder engine set, as usual, in the fore part of the frame; built up with the flywheel is a dynamo, the current from which passes directly through the controller to the motor, no battery of accumulators being employed. The feature of the "Lavo" system lies in the fact that only a single electric motor is employed, this being of the "differential" type—a machine which comprises two portions rotating in opposite directions and of which the resulting speed is the sum of those of the two parts. Each half of the motor is connected with one of the rear road wheels, rendering the use of the usual form of mechanical differential gear unnecessary. In addition to the saving in weight and the suppression of the differential, it is claimed that the use of a differential motor obviates all the drawbacks attendant on the

Fig. 5.—Elevation of Chassis of "Lavo" 24-30-h.p. Petrol-Electric Car, showing relative sizes of the different parts.

A. Petrol engine. B. Dynamo. C. Controller. D. Motor. E. Pedal controlling forward and reverse motions and brakes. F. Speed-varying lever.

employment of two electric machines, one for each road wheel. Instead of two collectors there is only one, and consequently no accidents due to a short-circuit in one of the two motors usually employed need be feared. The motor is suspended in the frame by double-acting springs in such a way that no shocks are transmitted to it when starting or braking the car. Starting and stopping, as well as the application of the brakes, is effected by a single pedal, the variations of speed being obtained by means of a lever on the steering wheel. A further lever is provided at the side of the driver by which he can control the forward and reverse motions by hand, as well as by the foot, or the lever may be securely fixed in a neutral position. Three models of pleasure and touring cars are being made, viz., 10-14-h.p., 16-20-h.p., and 24-30-h.p.; all are fitted with four-cylinder engines. As regards the transmission, the drive from the motor to the rear road wheels in the first two sizes is direct, while in the largest car it is by chains.

La Société Electromotion, of Route de la Revolte, Neuilly-sur-Seine, has secured the concession for France for a new petrol-electric vehicle, designed by Messrs. Balachowsky and Caire, who have, it is stated, been engaged in its development since 1903. The main components of the chassis are a four-cylinder petrol engine, a dynamo built up with the fly-wheel of the former, and two electric motors, the latter being contained in the hubs of the rear road wheels. The two points to which special attention has been devoted have been the automatic regulation of the current and the excitation of the generator. The former is obtained by the creation in the centre of the armature—which latter acts as the engine fly-wheel—of a zone, in which circulate compensating currents which ensure the diminution of the flux at the moment when the amperage rises, and maintain constant the power absorbed by the

generator, the speed of the engine being constant. This regulation is claimed to be so exact as to be in operation at all the various speeds, even at the slowest. Thus there is no weakening of the e.m.f. when the speed of the engine is reduced, the power of the latter being constantly utilised at its maximum efficiency. As soon as the engine, after it is started, attains a speed of 180 r.p.m., the dynamo develops sufficient power to drive the car at a low rate—from about $\frac{1}{2}$ to $1\frac{1}{2}$ miles per hour; this quality of self-excitation at a low speed is obtained without the employment of a battery of accumulators supplying energy to a special winding. The dynamo weighs 3 cwt., and can develop 30 kw. at the normal speed, with, it is claimed, an efficiency of 90 per cent. Only four brushes are employed, their position being definitely fixed after experiment to ascertain the exact point. The energy generated is transmitted direct to the motors, the armatures of which form the hubs of the rear road wheels. A feature of the system is the absence of the controller usually found on electric and petrol-electric cars, the speed of the car being entirely controlled by varying the admission of gas to the engine. A double set of brakes is provided on the rear wheels, these being so arranged that, on their being applied, the current to the motors is automatically cut off.

SOME USEFUL NOTES.

THERE are two methods of loosening nuts which stick to their bolts owing to rust or dirt. The first of these is a well-known one, that of moistening both the nut and the bolt with paraffin. Unfortunately it takes about half an hour before the nut can be loosened in this way. The second method is as follows:—Take a socket wrench adapted for use upon the nut and heat it until it is almost red, then apply it to the nut, thus heating the nut and loosening it without heating the bolt. The nut may then be removed with another wrench.

SLIPPING in a leather-faced cone clutch may be due to want of adjustment, and consequently remedied by tightening up the clutch spring. Very often slipping is due to the presence of grease, oil, &c., on the leather, in which case the latter should be well washed with petrol and slightly roughened with a rasp, and adjusted up a little by the spring. Of course, if the leather is badly worn and fired, there is only one remedy, and that is a new clutch leather. The latter gets badly burned by injudicious driving, such as slipping the clutch continually on the high speed on a hill, instead of changing on to a lower speed.

MYSTERIOUS cases of motors missing fire can occasionally be traced to leaks in the admission pipe, the vibration of the car causing the leaking joints to open up, at times to such a degree that enough air will be drawn through them to dilute the mixture until it loses its ability to fire. Soldered joints are especially liable to this trouble, and with them it will sometimes be found necessary to take the pipe down to locate the difficulty, as with the engine standing still and the pipe bolted in place the looseness will not show.

FEW motorists, even those who drive frequently at night, appreciate the importance of keeping the lens mirrors and front glasses of their motor-lamps clean. A greasy or dingy surface such as follows one or two evenings' driving absorbs a considerable percentage of the light from the flame. By far the best and handiest thing to clean the lens mirrors is a mixture of equal parts of alcohol and water; a 50 per cent. solution evaporates more slowly than pure alcohol, so giving time to wipe the glass clean. While on the subject of lamps it is worth mentioning that all tubing from an acetylene generator should slope either downward or away from the generator, and there should be provision for draining it at its lowest point, since there is a gradual condensation of water in the piping which, if it collects in pockets, results in objectionable flickering.

MR. M. A. MIDDLETON has a motor-car garage at Cotton End, Northampton, which should be of service to motorists visiting the town.

THE municipal council of New York now owns no less than 231 motor-cars, which are used by officials and in the work of the various departments.

AT New Scotland Yard, London, on Monday, a demonstration was given of the N.U. motor spirit.

THE Metropolitan Asylums Board has decided to obtain tenders for eight motor-ambulances for its Fulham station.

THE Oldham Council is seeking Parliamentary powers to borrow £568,000, included in which is £16,200 for motor-omnibuses and motor-cars.

ACCORDING to the report of the Secretary of State of California, the number of motor vehicles registered in that State since the law regulating the operation of motor vehicles went into effect in 1905 to November 1st, 1908, is 18,698.

ONE of our readers in Havana writes:—"The roads here in Cuba are ideal for automobiles. One road out of this city has only five turns in fifteen miles, and only three cross roads, and is as level and smooth as a floor. The power of your engine is your only speed limit, but petrol is nearly 2s. per gallon."

WE learn from Mr. C. Dupin, the manager of Gaulois Tyres, Ltd., that the Gaulois pneumatic tyres are meeting with increasing favour among British motorists. The company are now devoting attention to the production of extra strong tyres for use on motor-cabs and light delivery vans, and at the recent Paris Salon had on view a twin pneumatic tyre which is being introduced for use on motor-buses and heavy touring vehicles.

ACCORDING to Mr. Eric Boulton, who lectured on "Motor Omnibuses" under the auspices of the Junior Institution of Engineers on the 16th inst., the traffic of London will eventually be largely worked by double-decked motor-buses. Those running on the two main arteries east and west will probably seat forty passengers, while single-decked vehicles for from fourteen to twenty passengers would work outwards from the points at Oxford Circus and Liverpool Street, and Charing Cross and Aldgate.

A PRACTICAL work for motorists that should prove of substantial value to the novice is that on Motoring by Mr. R. P. Hearne. It is published at a popular price, and in the course of 150 pages the author deals with such matters as power production, ignition, and power transmission, while useful chapters on handling the car, the making of the motorist and the cost of motoring, add to its value. The volume has forty-eight illustrations and has just been added to the list of books for motorists supplied by Messrs. Cordingley and Co.

ACCORDING to the "Figaro," a company has been formed with the title of the General Trans-aerial Company, which is to start a public service of navigable balloons on May 1st next. The first four will be named the Ville de Bordeaux, the Ville de Nancy, the Seine, and the Gironde. They are to carry fifteen persons, including two engineers and the captain. They will have a capacity of 5,000 cubic metres, and will be provided with motors of 200-h.p. The first trips will be over Paris by night as well as by day, and visits will be made to Versailles, Saint Germain, Fontainebleau and other favourite resorts in the neighbourhood of the French capital.

ONE point brought out at the recent London and Paris Motor Exhibitions is a growing tendency amongst motor manufacturers to adopt the "set spark" system of ignition in preference to the use of the variable timing and hand regulation system which has hitherto prevailed. The advantage secured in ridding the driver of one of the numerous matters to be attended to in handling the machine is obvious. The practice is made possible by the use of magneto ignition. The voltage of the magneto current increases with the speed, and the intensity of the spark consequently increases proportionately. This effect is considered to compensate for the lead which otherwise would be required, so that the regulation is thus made automatic and in direct relation to the engine speed.

A COMPANY has been formed in Toronto to introduce a service of motor-buses in that city. It is stated that fifty thirty-six-seated vehicles are to be acquired.

FIRST Motorist: "You say you had the steering wheel put on the left out of consideration for your wife?" Second Ditto: "Yes; I'm deaf in my right ear."—*Life*.

MR. W. McCURD, the well-known dealer in second-hand cars, is apparently one of the lucky ones, for during the past four years of his motoring career he has only had one puncture. May his luck continue!

WHILE the event of the year has been the adoption by the Daimler Company of an engine of American design, we hear that a large motor-car concern in the United States has secured an option on the American rights in one of the two-cycle engines exhibited at the recent Olympia Show.

THE exports of motor-car parts from the United States during the ten months ending with October last only amounted to £899,300, as compared with £1,056,397 in the corresponding period of last year. The United Kingdom heads the list as being the best customer with £321,015, Canada being second with £209,405, and France third with £105,019.

The Dennis 15-n.p. 15-cwt. Royal Mail Van, with Messrs. Puttock and Son standing by it, which runs between Farnham and Camberley, collecting mails in the Camberley district and meeting the large mail vans which pass each night through Farnham on their way between Southampton and London.

MRS. SPORTINGTON: "I shall want you promptly at ten, Parker." Parker: "Yes, mem, but—beg parding, mem—will you want me as a chauffeur, groom or coachman, mem?"—*Puck*.

IN the Euston Road, which has become familiar to motorists as the centre of a great motor trading district, a new establishment now testifies to the enterprise of the Car Mart, Ltd., which has developed a splendid business in connection with the disposal of second-hand cars. These fine showrooms at 297-299, Euston Road, go back ninety feet to Warren Street, London, W.C., and the several floors give capital opportunities for the storage of cars as well as their thorough overhauling before being offered to prospective customers. The principle upon which the Car Mart, Ltd., does business is to sell on commission and only to take such vehicles as are likely to afford satisfaction to the buyer. They have a painting department on the premises, and are thus able to ensure the cars being sent on the road with a good appearance as well as in good condition. On the roof are extensive washing facilities, and the whole establishment is well equipped for effecting the exchange or sale of automobiles. Several small Peugeots and 1909 Mercedes cars were prominent among the stock at the time of our call, and in range and variety the show of cars was certainly most attractive.

A MOTOR-CAR exhibition is to be held in Toronto, Canada, from the 18th to the 25th February next.

PLANS are being prepared for the construction of a cement race track for the exclusive use of automobiles at Los Angeles, U.S.A.

GENERAL J. FRANKLIN BELL, chief of staff of the U.S. War Department, has acquired a White 20-h.p. steam car with limousine body.

A COMPANY has just been formed in Paris (44, Rue Lafitte) with a capital of £20,000 and the title La Société Française de Construction d'Automobiles Poids Lourds.

MR. W. LAWLEY has opened temporary premises in the Broughton Street Lane, Edinburgh, where he intends to develop his interest in the motor trade, with a view to starting a large garage in May next.

AFTER prolonged deliberation, lasting over two years, the American Automobile Association has condemned motor-car races on circular tracks built for horse racing and of a mile or less in length, and resolved that it will have nothing to do with them in the future.

THE Badminton Register of Social Fixtures for 1909 is to hand from Messrs. A. Webster and Co., 43, Dover Street, London, W. The features of this annual publication are well known to our readers, and a list of automobile clubs gives the work motoring interest.

WE illustrate herewith the ingenious motor-car jack known as the "Passe Partout," exhibited at the recent Paris Salon by M. H. Libert, 10, Quai de Charenton, Charenton-le-Pont (Seine.) As will be seen, the device works on the principle of a lazy tongs and is actuated by a detachable handle. One great point of the new jack is the small space it occupies. When closed, as shown in the lower of the two figures, it is only 2½ in. high, while, when fully opened, its height is just over 16 in.

THE Poetting prize of 2,000 crowns, which is given annually by the Austrian Automobile Club for some invention or work of an Austrian subject calculated to advance the use of automobiles, will next year be awarded for an improvement in the methods of testing pneumatic tyres or for a new method of testing, and the machinery and devices used. The contest will be closed on March 20th, 1909. The Austrian A.C. has contributed the sum of 3,000 crowns for the practical testing of the device or method winning the prize.

THE Registered Date Indicating Blotting Pads of Messrs. Hudson and Kearns, of the Hatfield Street Works, Stamford Street, London, S.E., are the best publications of the kind we have seen. Pads No. 8 and 8a are particularly serviceable and sensible combinations of Blotting Pad and Diary for the desk. They have stood the wear and tear of editorial use in the office of the *M.C.J.* with excellent results, and should prove equally durable and desirable in all automobile offices.

THE Atlas Motor Company, of 172 and 174, Queen's Road, Peckham, S.E., send us a copy of their delightful calendar for the year, which they will be pleased to forward to any reader who will send them the registered number and make of his car. The subject of the picture is of motoring interest and entitled "A Twentieth Century Hold-up."

FROM Madame Lockert (41, Rue de Seine, Paris) comes a copy of the 1909 edition of the "Agenda-Buvard du Chauffeur." This is the seventh year of publication of this useful diary, the noteworthy feature of which are the full-page caricature sketches of prominent members of the French and British motor industry. Madame Lockert also sends us some specimens of the cardboard models of different types of motor-cars, airships, &c., of which she is now making a speciality. These should afford many hours of interesting amusement to the younger generation, as, by carefully cutting the designs and piecing them together, a cardboard model of an automobile can be made.

MR. G. HILL is making a speciality at his Providence Works, Burton-on-Trent, of radiators for heavy motor-cars and vehicles for commercial purposes.

THE Santa Maria de Belsue Drainage Works authorities at Huesca, Spain, are inviting tenders until January 5th for two steam or petrol motor-lorries.

IN connection with the Imperial International Exhibition, which is to be held at Shepherd's Bush next year, a special section will be devoted to the health resorts of Great Britain and Ireland.

As motoring has increased so much in India during the past year or so, it is expected that the Government of India will shortly take some steps in the interests of motorists to regulate motor traffic and indicate dangerous turns, bends, Irish bridges, &c.

MESSRS. R. H. AND F. S. BARNWELL, of the Grampian Motor Engineering Company, of Stirling, have built and are experimenting with an aeroplane of their own design. The apparatus is of the monoplane type, and is fitted with a 40-h.p. V-type two cylinder air-cooled engine.

ACCORDING to the St. Petersburg correspondent of the "Times," Captain Windham has offered to the Russian Government the aeroplane invented by him, and has undertaken within six months to construct a machine which will carry him 300 metres at a speed of 50 kilometres per hour.

THE General Purposes Committee of the Corporation of the City of London have prepared a bill for the better regulation of traffic along the streets within their area. One clause will enable the Corporation to make regulations prescribing the route to be taken by automobiles in the public service.

AMONG the orders recently secured by Messrs. Dennis, Bros., Ltd., Guildford, are a demonstrating van for their Cardiff agents, Messrs. Sully, Penarth Road; Cardiff; a similar vehicle for their Leeds agents, Messrs. Thos. Green and Sons, Smithfield Iron Works, Leeds; and two 28-h.p. char-a-bancs and two 20-h.p. wagonettes for Mr. A. C. Jones, Carberry Tower, Musselburgh.

A PATENT has recently been taken out by Baron R. A. L. Lehmann and M. L. Durand, of Paris, for a method of utilising the mixture from the carburettor as a means of cooling the cylinders. The gas on its way to the explosion chamber is caused to flow through the usual cylinder jacket, the heat of the cylinder walls thus being absorbed and utilised to warm up the combustible mixture. In an alternative method the inventors draw all the air required by the carburettor through an opening in the cylinder heads, and through jackets to the vaporising chamber.

THE Ocean Accident and Guarantee Corporation, Ltd., of Moor-gate Street, London, E.C., issue a Chauffeurs' Text Book, which naturally gives full information of many policies of particular value to motorists issued by the Corporation. Several pages are devoted to the registration of cars and the duty of the driver in cases of accident, while the registration marks for the United Kingdom are a feature. We also notice a full list of motor-cars in general use, this also giving the horse-power and the cost price. Tables of gradients and wind pressures, as well as a diary giving a record of miles run, are other features of a little book which will be of considerable service to drivers.

AMONG the Annuals "Hazell's" occupies a high place both as an authoritative and a comprehensive work of reference. Of the new articles which appear in the 1909 edition is one on aeroplanes, airships, and balloons, the progress during the year being fully set forth, although the Aeroplane Club recently formed by Capt. W. G. Windham might have been included in the list of societies. Four pages are devoted to motor vehicles for 1908, the records on the Brooklands Track being fully given. Attention is drawn to the general tendency towards standardisation and reduction of unnecessary parts, and one of the features of the year is rightly said to be the introduction of low-powered models by firms whose names have hitherto been solely concerned with high-powered machines. The great strides made in connection with public services are also set forth, and mention is made of the serious efforts now being put forth to remove the dust nuisance. The other sections of Hazell's Annual seem to have been equally well brought up to date, and the publication will be of considerable value to the general reader as well as the student of affairs. Messrs. Hazell, Watson, and Viney, Ltd., are the publishers.

CONTINENTAL NOTES.

The Paris Heavy Vehicle and Aeronautical Exhibition.

The pleasure cars and accessories have now all disappeared from the Grand Palais, Paris, their place having been taken by the display of industrial motor vehicles, motor-boats, airships, aeroplanes, &c., which is to be inaugurated on Thursday, the 24th inst., and will remain open until Wednesday of next week. Special interest is being taken in the aeronautical section, which it is reported will comprise fifteen or sixteen full-sized aeroplanes, a large airship, the Ville de Bordeaux, and a large number of models of aeroplanes, airships, and flying machines of every kind. The place of honour will be given to M. Adler's Avion, which in 1898 was the first aeroplane on record to rise from the ground. A full report of the exhibition will be given in the next issue of the *M.C.J.*

German Motor Car Imports and Exports.

The imports of foreign motor cars and parts into Germany during the ten months ending with October last only attained a value of £580,126, as contrasted with £790,981 in the correspond-

purpose of judging a small balloon was attached to a cord 100 metres long, and secured by other cords against lateral action by the wind. The balloon was easily cleared by the aeroplane, which had previously been in the air for ten minutes.—The Aero Club of Belgium has founded a prize to be known as the Prix du Premier Kilometre. This consists of a gold medal, which will be awarded to every Belgian aviator who during the course of next year flies a distance of one kilometre.—On Wednesday last week Wilbur Wright made a remarkable flight; he quickly rose to a height of 295 ft., and then, stopping his motor when he was still over 100 ft. from the ground, glided to the earth without the slightest shock.—The Aero Club de France has decided to organise a race for dirigible balloons from town to town over a distance of 250 miles next summer. In addition, a "grande semaine d'aviation" is to be held during the last week of August, when the competition for the Grand Prix d'Aviation and the Coupe Internationale d'Aviation will take place.—It is reported that the German Government has placed an order for four airships of the Zeppelin type.—The opening of the aeroplane demonstration ground at Savigny-sur-Orge, near Juvisy, has been postponed until January 10th.

The Vaniman Aeroplane.

The latest addition to French flying machines is the Vaniman illustrated herewith. It is of the tri-plane type, and is fitted with an Antoinette 70-80-h.p. eight-cylinder engine.

ing period of 1907. On the other hand, there has been a slight increase in the exports of automobiles from Germany—from £573,660 to £594,070.

Motor Cars in Russia.

According to a recent return, there was an appreciable increase in the importation of automobiles into Russia during 1907. The imports of pleasure cars doubled as compared with 1906, and those of industrial motor vehicles increased from 17 in 1906 to 147 last year. The majority of the pleasure cars imported were of French manufacture.

Aeronautical News.

The event of the week has been the magnificent flight of 61½ miles in 1 hr. 54 min., accomplished at Le Mans on Friday last week by Wilbur Wright. He has not only beaten the world's aeroplane record, but has also considerably increased his advantage towards securing the Michelin prize of £400 for the best performance made before midnight on December 31st. On the same day Wright won the prize of £40 offered by the Aero Club of the Sarthe for the first aeroplane flight at a height of 328 ft. For the

Miscellaneous Items.

A public motor-car service has been established between Trieste, Abbazia and Fiume. Three cars, two for passengers and one for luggage, will run twice daily for the present.—Some trials were carried out in Paris, on Tuesday, with a Renard road train, the engine of which was using naphthaline as fuel.—So far only seven entries have been received for the A.C.F. Grand Prix Race, viz., three Cottin-Desgouttes, three Mors, and one Guillemain.

L'Auto en Chine.

Les Chinois connaissent les automobiles depuis quelques années déjà. Mais c'est sans enthousiasme qu'ils voient ces voitures inexplicables, et surtout inexploquées, pour leur jugeotte très vieille Chine, circuler de temps à autre dans les rues de Pékin, leur très céleste capitale. L'autre mois, disent les journaux de là-bas, un Français, n'a-t-il pas eu l'idée d'instituer un garage à Pékin. Et dans quelle rue, s. v. p. ? Dans celle de la Grande Tranquillité ! C'était un défi aux traditions—installer ce va-et-vient de monstres trépidants au milieu même d'une voie qui, depuis des siècles, est renommée par son aspect pacifique.

ALONG SURREY HIGHWAYS.

East and west through the county of Surrey runs the chalk ridge of the North Downs, the great highway of Southern England from the Straits of Dover to Salisbury Plain. Of all English roads, it has carried the longest pageant. It saw the beginnings of English history; for four centuries it was one of the best-known highways in Christendom; the vision from its windy heights is one of the widest and most gracious of all visions of woods and fields and hills. By the trackway they made upon the ridge came the worshippers to Stonehenge; Phœnician traders brought bronze to barter for British

The Devil's Punch Bowl, from Gibbet Hill.

tin, and the tin was carried in ingots from Devon and Cornwall along the highway to the port of Thanet; Greeks and Gauls came for lead and tin and furs, and the merchants rode by the great Way to bring them. When Cæsar swept through Surrey on his second landing, his legions marched over the Way before he turned north to the Thames. When the Conqueror drove fire and sword through Southern England, he went down to Winchester by the chalk ridge; and when the great lords under the Conqueror and Rufus, Richard de Tonebridge and William de Warenne, built their rival castles, they built them to command the highway; so did Henry of Blois build his castle at Farnham; and so was Guildford Castle built. Of warfare later than Norman days, the Way saw nearly all that went through Surrey. Simon de Montfort and his barons rode fast by the ridge the year before Lewes; they lay at Reading on the twenty-ninth of June, and on the first of July at Reigate. In the wars of the Parliament, Farnham west of the Way saw the siege of an hour; Lord Holland led his little band from Dorking to Reigate and fled back again. Last of the echoes of Stuart battles, Monmouth, after Sedgemoor, was driven through Farnham to lodge for one night of misery and fear in Abbot's Hospital, in Guildford.

THUS is the claim of Surrey to great importance in the national annals established by Mr. Eric Parker in introducing his readers to "Highways and Byways in Surrey"—a volume of considerable interest to all who know the pleasant lanes and great wide roads of this delightful English county. It is illustrated with fine drawings by Mr. Hugh Thomson, some of which are reproduced in our pages by permission of Messrs. Macmillan and Company, Ltd., the publishers of the volume. These are more than 150 in number, and nearly every one will refresh the memory of the motorist who has gone into Surrey, avoiding police traps by the way. Very interesting is the chapter on the Pilgrim's Way, with its story of the past and its route at the present time. Then we are taken to the westernmost of all Surrey towns, and with pen and pencil a picture is presented of Farnham, with its old and orderly main streets, and recollections of Cobbett, who was born in a farmhouse now known as the Jolly Farmers' Inn, on the outskirts of the town. Readers of the "Rural Rides" will thank Mr. Parker for reviving memories of those pleasant chapters, although Cobbett's characterisations of scenery are not always happy, *e.g.*, when he described Hindhead as the "most villainous spot God ever made." Frensham Ponds, Waverley Abbey, and Moor Park are in the vicinity, and have full descriptions. And then the author grows eloquent over the Hog's Back.

This is certainly the noblest highway in Surrey, and, perhaps, the most characteristic of the county. You may often travel along it and yet not see the finest of the view on either side; in the summer, more frequently than not, the whole countryside, north and south of

the ridge is swimming in a blue haze which dims and muffles the horizon. But there is no other road on which you can walk so far and see so much broad Surrey country open out mile after mile on either side, and from which you can watch so many changes of woodland and common and cultured fields, from the green and golden hops about Farnham to the wheat and oats above Seale and Puttenham, and the long potato drills in the chalk by Wanborough. But the view is not the single beauty of the Hog's Back, though to walk high in the wind along open space is possible only on a few roads in the county. The Hog's Back has a treble charm belonging wholly to the roadway itself; its width, its spacious grassy rides on each side of the broad hard riband of metal that runs white and unswerving east and west, and most gracious of all, its deep and exuberant hedges. The highest point on the road lies a mile beyond Wanborough, on the way to Guildford. Here you are over five hundred feet up, and the roads drop gradually, ending in a sudden slope almost as soon as Guildford, bricly and cheap-looking from this aspect, comes into view.

Naturally, Guildford, upon which eight highroads converge, has much attention. Even Cobbett praised it as one of the prettiest towns in England. Its main street has not changed much for years, and its inns have been famous for centuries. An excellent chapter is that on Godalming, the best view of which is obtained from the hill roads above Farncombe. Not many towns group themselves so well against hills and woods; few have so spacious and quiet a foreground. Unfortunately, the "restorers" were at work on its parish church in 1840—with the result that usually followed in that generation of despoilers. To many readers the section devoted to Haslemere and Hindhead, in association with Sir A. Conan Doyle, George Eliot, Mrs. Allingham, Dr. George Macdonald Tyndall, and other famous names, will have most interest. Hindhead, we are told, is the most superb and most disappointing thing in Surrey. "The worst way to see Hindhead is to follow the motor-cars up the main road. The motor-cars see the road, but never Hindhead at all."

We illustrate one of the distinctive inns of the Fold country—Alfold, Ifold, Durfold, Dunsfold, Chiddingfold, and other

The Crown Inn, Chiddingfold.

"folds," which lie among oak woods and ploughlands that once were oak woods. Alfold has hardly begun to grow, Dunsfold straggles, and Chiddingfold sits compact about its sunny green. The old inn is the Crown, which claims to have been standing for more years than five centuries. It is a pleasant and solid hostelry, dark with enormous wooden beams. Another picture more familiar to the week-end Metropolitan motorist is that of the village street at Ripley.

Ripley itself, but for the traffic, would be the prettiest village on the road. A long string of low-roofed houses lines the highway; little white gabled cottages offer tea and refreshments. Two old inns share most, I suppose, of the custom of fasting travellers. The Anchor, an inn of many gables, has fixed itself in the affections of bicyclists since the days when they rode velocipedes, and its black beamed walls and passages hold drawings of strange souls mounted on wheels which would have scared Ixion. The Talbot, which was once the Dog (but a talbot is a dog always), is a house of imposing squareness. You may see the dog painted above the door, a liver-and-white fox-terrier, all proper. Opposite the inn stretches Ripley Green, a broad and shining level with many memories of Surrey cricket, and in particular of "Lumpy" Stevens, of Send. The motor-car has brought prosperity, even if it is a prosperity that can soil. But the tarnish washes off in night and rain. Ripley may look its best early on a Saturday morning, before the flood rushes down the road. When the little village lies clean and fresh in the sun, and the inns are busy with white tablecloths and cooking potatoes, and the children sit on the edge of the green before the dust comes, there is a sense of orderly bustle and of waiting for a day of hard work and good money that is pleasant enough. One building only has suffered from the business of the road. The little church stands behind arches and canopies of clipped yew, its walls almost touching the highway. It is an interesting little building, though much altered from its oldest form; the chancel has the remains of clustered pillars, and a beautiful string-course of Caen stone running round it. But those have not been the only attractions to visitors. Two miles up the road lies the Hut Pond, opposite an inn that serves many tables. There is no quiet on the pond in the business of the day, but I was once on it on an October evening, and as the sun went down the sky filled suddenly with teal. Bunches of teal wheeled and circled in the cold twilight, whizzed down among the rushes, darted up again and round over the pines, then shot down again and settled, splashing quietly in the sedge.

Battlefields are not numerous in Surrey. There is one at Ockley, the Roman Road of which is a typical illustration from the volume under review. The great battle of Ockley was fought when the Danes came two centuries before Harold fell at Hastings. To-day the "peace that broods over Ockley is born of wooded parks and sunlit spaces," and the green is one of the largest in Surrey, probably the prettiest of them all. Mr. Parker's wanderings have taken him everywhere in Surrey, and we must leave his entrancing volume, which can be dipped into with interest on every page, with a reference to Weybridge. Its silence has been disturbed, according to the lawyers, by the

The Roman Road, Ockley.

coming of the car. Mrs. Kemble was one of its most famous residents for years. "If," says Mr. Parker,

"that charming and brilliant lady could revisit these glimpses of the moon, what would she say of that infinitely larger 'mound' and its surroundings in the new motor track with which it is Weybridge's unhappy fate to be linked to-day? Nearly a square mile of quiet meadow and forest and hill slashed and scarred and scaped into a saucer of cement; acres of pine and cedar and oak and rhododendron smashed and sawn to fragments; the roar of thundering Napiers and Hotchkisses, where once the reed-warblers climbed the meadow-sweet and cuckoos called from the willows—how would she have addressed the originator of that staring, blatant racecourse? Strangely enough, she saw something of the kind befall her beloved Weybridge pinewoods

sixty-seven years ago, and wrote of it in her diary. The motor course led to at least one interesting discovery. When the picks were hard at work in the sand, and day and night were enlivened by steam-engines, and casual labourers sleeping off their wages in other people's summerhouses, there went about a word of a great find. A pot of copper had been found, some said; of coppers, others said; of Roman gold coins, there was a rumour, and all the coins exchanged for beer. Perhaps some coins were found; what certainly was found was a beautifully-made bronze bucket, buried deep below clay and sand in a bed of gravel. It has been classified by the experts as belonging to a Venetian workshop of the seventh century B.C., actually the days

The Village Street, Ripley.

of the early Tarquins. Prehistoric traffic between Britain and Italy may not be an entirely new idea, but the bucket opens a new chapter.

The "Highways and Byways in Surrey" is certainly one of the most interesting books of the season, written, illustrated, and published by recognised authorities in their respective departments of literary activity.

SPEED IN THE ANIMAL WORLD.

TESTING the comparative speeds of various animals and fowls by speedometer is the latest pastime that is being indulged in by some American motorists. Mr. Donald McIntosh, of the Studebaker Automobile Company, declares that his car was paced for eleven miles by a jack rabbit over a fine piece of road near Leavenworth, Kansas, and the speedometer fluctuated from thirty-seven to forty-two miles. According to the same authority the cottontail rabbit does well for about two to three miles at about twenty-three to twenty-six miles an hour, but cannot exceed twenty-eight miles an hour. Of the bovine tribe, observations show that the two-year-old steer is most agile; he is capable of about three miles at an eighteen mile pace and hates to be conquered. In this characteristic he differs from the horse, which invariably seeks a side road when chased by a motor-car. The steer, however, continues straight along the road until exhausted. As regards domestic fowl, Mr. McIntosh declares the goose belies its reputation for lack of wisdom. Invariably it steps from the road on the approach of an automobile, while the chicken loses its mental equilibrium, and cannot decide whether to race the car or select one side of the road or the other. The turkey will stand on its dignity as long as possible—sometimes a trifle too long—but it is not as cautious as the goose.

MESSRS. JARROTT AND LETTS send us some rather interesting figures they have been able to get out in regard to the running of a single-cylinder Sizaire-Naudin car which go a long way to prove that a small-powered car can be run a great distance at a very small cost. The car in question was one belonging to the firm, and was run by Mr. Ernest Gould, who has been travelling on their behalf through various parts of England. The distance covered between August 3rd and September 14th was 7,713 miles, the total cost of running for petrol, oil and garage charges showing an amount of £30 9s. 7d. Three hundred and fifteen gallons of petrol were used on the car during that distance, and twenty-one gallons of lubricating oil.

MOTORING ACCESSORIES.

Aluminium Castings.

Mr. R. W. Coan, of 219, Goswell Road, London, E.C., has become identified in the eyes of motorists with aluminium castings of every variety, as well as the repair of the same. He is a practical worker in the metal and supplies hardened aluminium for turning and other purposes. Of this fact we are reminded by the arrival of a cast aluminium card tray 12in. by 8½in., on which are seen a motor-car on the road, motor-boats, an aeroplane and other features of modern locomotion. These are

Fig. 1.

representatives carrying Coan's clean castings cast in aluminium, and the tray (Fig. 1) should do something to keep Mr. Coan's specialities well before the trade during the coming year.

Speedometer Guarantees.

With reference to the confidence of Messrs. W. S. Searle and Co., 33, Glasshouse Street, London, W.C., in their O.S. First Prize Speedometer, we may mention that they guarantee their device against loss of magnetism for ten years from the date of delivery to the motorist. Further they agree to replace or repair at their own expense within the lapse of one year any defective part, and will also test free any instrument sent to them, while dials will be changed and reset to zero at a moderate charge. An interesting offer by the firm is that of a Certificate of Accuracy, which will be supplied subject to the test being satisfactory. This has several times proved its value in the police court and is becoming increasingly appreciated by motorists.

C.A.V. Magnetos.

A good type of magneto which we have lately seen is the C.A.V., which has proved itself since its introduction in 1907. Simplicity is the feature of the instrument, in which the wearing parts of the cams, &c. are of hardened steel. Parallel ball bearings are used throughout and easily accessible oil ducts leading to the various bearings facilitate lubrication. An important point in connection with the C.A.V. magneto is that the contact breaker can be removed bodily for cleaning or adjusting the platinum points. This is done by simply drawing back a couple of spring plungers. These magnetos are made in various types for cars and motor-cycles. Messrs. Vandervell and Co. are now producing fifteen distinct types of high tension magnetos for automobiles, comprising single, twin, four and six-cylinder machines.

The Lomax Detachable Tread.

Special advantages of real importance are claimed by the Lomax Tyre Company, of Great Charles Street, Birmingham, for their detachable tread now being placed on the market. The rubber tread can be either cross grooved or plain and is built up on a specially prepared fabric. It is attached to the rim by metal clips which engage into the upturned edge. The company has rendered good service to motorists in bringing this detachable tread to their notice.

General Accessories.

The Motor House, of Euston Road, London, N.W., have issued a new list of motor accessories and clothing which will be of service to those who intend to overhaul their car equipment in the New Year. A large selection of head lamps has been obtained, including acetylene lamps for use with separate generators and self-contained acetylene head lamps of stylish model, giving a good light, the gas being generated automatically. The Regal tool kit is also being specialised in by the firm. This is made in two sizes in a stout waterproof case and folds up in a very compact fashion. In electrical accessories the Motor House has a large stock of Regal accumulators, the positive plates of which are made with a special

grid so as to secure a large surface capacity. To prevent the plates breaking from the lug a solid bar is cast, and it is practically impossible for any break to occur with ordinary usage. A large consignment of motor horns has also been secured by this firm, including the Mobile horn, which is a well made and excellently finished model provided with the newest dashboard attachments. Mention may also be made of the Prowodnik motor tyres, which are the subject of a special list by the Motor House, the firm having secured a very large stock, which is now being disposed of at a considerable discount from the prices which have hitherto ruled.

Spare Tyre Protection.

To the car owner at all times the protection of spare tyres is a matter worthy of the most careful consideration, but at this period of the year, when weather conditions are at their worst, it becomes a question of vital importance. One of the most successful devices in this connection is the Brooks patent spare tyre wrapper. There is no lacing with this wrapper; it is exceedingly neat in appearance, goes on like a glove, and, above all, does not gape at the bottom and thus defeat its object by letting in water. Messrs. J. B. Brooks and Co., Ltd., Birmingham, are supplying this useful accessory.

The Usona Bulb Guard.

A useful device known as the Usona motor horn bulb guard has recently been placed on the market by the Usona Stamping Works, 199, Grand Street, New York. Its purpose is to prevent the breaking off of horn bulbs at their joints with the tube. A bulb fitted with this guard can be attached in any position most convenient for use, and can be blown with a push of the elbow or touch of the hand, as it is not necessary to squeeze the bulb in the ordinary way when the guard is used. The device is made of brass and is given a highly lustrous finish. It is tapered to conform to the shape of the bulb and is made in three sizes to fit all standard bulbs.

The Gabriel Horn.

Although not the latest novelty introduced to motorists by Messrs. Brown Bros., of Great Eastern Street, London, E.C., the Gabriel Horn claims recognition as one of those tried devices which have become a standard accessory on the car. Utilising the waste gases from the exhaust to secure its operation, the horn also avoids the complications that ensue when much mechanism is provided to secure a single purpose. The Gabriel note, too, is distinguished by a rich musical tone which will serve to give good warning without adding offence. The device consists of a brass tube shown in Fig. 2, which is divided into three chambers, each producing separate and distinct notes blending into a melodious tone when operated by the foot lever or by a cable attachment fitted to the steering column with a small lever attached on the Bowden principle. In this case all that is required is a pulley fastened at the point where the cable turns in the direction of the steering column. The horn is located by the side of the car and a valve supplied with the instrument is placed on the exhaust pipe at the rear of the silencer, and as closely as possible, being connected with the foot lever by a wire cable, a spring being also attached to secure the closing of the valve when the pedal is released. To allow for the

Fig. 2.

varied nature of the exhaust—light or strong—a shorter or longer 1 in. pipe should be used between the valve and the horn, and, in some cases, it will be found advantageous to place a wire screen in the pipe so as to break the force of the exhaust. The Gabriel horn can be easily fixed, and, once in position, requires no attention save for an occasional cleaning, when the parts can be readily taken down and replaced in good working order in a few minutes. The volume of sound is entirely under the control of the driver, and the device is one that has proved popular in a great degree. It is made in four sizes suitable for cars up to 10-h.p., from 10-h.p. to 20-h.p., 16-h.p. to 30-h.p., and 25-h.p. upwards. Inquirers should mention the name and model of their car, together with the outside diameter of the exhaust pipe, in order to facilitate the selection of the particular size horn for their requirements.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE "SHEFFIELD-SIMPLEX" GEAR-BOX-LESS CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As we believe there is an impression about that in our new model car we have, in dispensing with the ordinary orthodox gear-box, and embodying a two-speed and reverse gear in the torque resisting member, at the same time increased the unsprung weight on the rear tyres to a considerable extent, we wish to take this opportunity of stating that such is not the case. Compared with our other type of live axle chassis, of exactly the same power and dimensions, which generally is of about the same weight as other makes of chassis of the same power, the unsprung weight on the rear wheels is approximately the same—in fact, if anything it is a few pounds in favour of the gear-box-less type of chassis.

The possibilities of this can be readily appreciated by consideration of the following points of construction of the unsprung portion of this new model. In the first case, the method we have adopted in dispensing with the ordinary gear-box has resulted in a saving of 340 lb. (the equivalent of three lady passengers) in the total weight of the chassis, practically the whole of which was previously carried on the rear wheels. This

wheel, it could be made of the ordinary small dimensions if external webs were used, but, considering the casing is of aluminium, the slight additional weight of making it the larger section is unimportant compared with the numerous other advantages this form of construction provides.

We may say that the question of unsprung weight in this new type had our most serious consideration at the time we produced the first, one for experimental purposes, and it is owing to the very careful manner in which we carried out the design of this car that we were able to obviate this much-debated point in motor-car construction. We may say that the first model of this car was put on the road as early as April last year, after which we subjected it to road tests extending over 5,000 miles, in which it covered roads and known hills extending south as far as Devonshire and Somerset, and north over the Scottish Trial Route. During this period it was driven not only by ourselves, but also by a number of private users of cars, and without exception the improvement in running and efficiency was such that all those who had an opportunity of going on the car were astounded what it could do. The increase in efficiency and flexibility is most marked, enabling practically all the driving, including

Touring in Brittany —La Place Nationale, Quimperle

naturally greatly relieves the load carried by the rear axle, in consequence of which, without sacrificing any necessary strength, we are enabled to make the construction of our axle lighter.

In the second case we would point out that in this model, as well as our others, we adopt the arched principle of live axle, which results in placing the same under compression instead of under a bending strain, as is usual with straight axles. This principle at once enables a lighter axle to be constructed of the same or even greater strength than the straight axle. Thirdly, the propeller shaft always running at engine speed also permits of this part being made lighter without sacrificing strength in comparison with the usual type of propeller shaft behind the gear-box. Fourthly, we make a standard of fitting Rudge-Whitworth detachable wire wheels to this model, which are lighter than the artillery pattern wood wheel.

In explanation of the large diameter of the axle casing we would like to mention that this is caused owing to our putting the stiffening webs for this part inside instead of outside, which, besides making a much cleaner casing, obviates the awkward dirt-collecting corners that exist with external webs. We think it will be agreed that this construction is more mechanically sound than the ordinary type with external webs. Further, it also facilitates very greatly the question of accessibility, as in the case of this axle a large inspection cover at the rear of sufficient size to enable the differential gear to be not only examined, but to be taken out if necessary by the removal of four nuts only is provided.

As this axle casing only contains the differential gear and crown

starting, to be done on the direct gear, it even taking difficult and tortuous ascents having gradients of 1 in 7 on this gear; in fact, it was really necessary to get away from the main roads to look about specially for gradients sufficiently steep to necessitate the use of the lower gear, and even then it ascended hills like Porlock on the lower speed at speeds well up to and over the legal limit.

Also, during the 5,000 mile test, the car was driven at high speeds over rough roads with a view to finding out if there were any weak points in the construction, and we can honestly say that from the records we kept, that not only did the car not show any signs of wear at the end of the test, but also that there were no signs of any ill effects from the unsprung weight on the rear tyres.

The actual weight of the chassis of the Sheffield-Simplex gear-box-less car, though of six-cylinders, 48 h.p., is only 21 cwts., as against anything from 23 to 28 cwts. in other chassis of similar h.p. and size, and, owing to the great advance in simplicity it embodies, provides a light high-powered six-cylinder car with, we think we can safely claim, no more parts than any four-cylinder car of equal size and class, whilst the capability of being able to do practically all work on the direct top speed improves the running to an extent that has to be tried to be fully appreciated.

The reduction in the number of parts combined with the corresponding great reduction in weight has also the natural effect of a considerable reduction in cost of running and maintenance.—Yours truly,

PERCY RICHARDSON.

THE DISPOSAL OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The suggestion made by your correspondent, G. Campling, that petrol is poured down the drain by persons "after washing their blouses" is probably the cause of the fires and explosions which occur from time to time in the sewers. The local authorities are apt to blame the proprietors of motor garages in these matters, but the chief offenders, after all, are most likely to be those persons who use petrol for cleaning purposes in their homes. Are these persons liable to any penalty for doing this?—Yours truly,

G. TROPP.

A WARNING TO MOTOR TRADERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to warn motor agents and dealers in the Metropolis that the police are just now devoting considerable attention to cars bearing trade number plates, so that they would be well advised to keep an extra careful eye on the entering in and out of such vehicles as may be sent out for trial or tuning-up runs.

The other day I heard of a somewhat interesting case, the police stopping a motor-lorry with a trade number and carrying a load of old iron, and asking for the name and address of the driver and the owners. The latter were able to prove that the machine was out on a *bona fide* trial run, the intending purchaser stipulating as a condition of the bargain that the vehicle should carry its full load up a certain hill. The police at first demurred, but finally realised that they had no case and quietly retired.—Yours truly,

A MOTOR AGENT.

Winter Sports in Switzerland.—Skiing on the Righi.
(La Suisse Sportive.)

THE DUST PROBLEM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I hope you may find the following note worth recording. As I was driving from Canterbury to Ashford, two cars passed me. One smothered me with dust: the other raised less dust than a bicycle.

The dustless car left a clear impression of the tyre suds on the road: the dusty one left a series of scratches pointing backwards. Both were running at the same speed, about 25 to 30 miles per hour, thus showing the same relative efficiency for travelling purposes; but the dusty car was expending its (excessive) power twirling its wheels round, scratching up the gravel and throwing it backwards, whilst the dustless one was using its (less) power all in propulsion.

The inference is that the one car was *over-powered in proportion to its weight* and lost efficiency by lack of adhesion to the road.

An easy course of experiment might indicate a definite relation that ought to exist between the total adhesive weight of a car and the power of the engine that is to drive it. Perhaps 1 cwt. to 1 h.p. would be found about correct, and such a principle put in force might lessen our troubles.—Yours truly,

THEODORE F. S. TINNE.

THE COST OF A CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the majority of makes of motor-cars are now being marketed at a normal value, and the buying public appear to be seeking after cheap cars rather than expensive ones, it might be interesting to give some hints regarding the exact value of a motor-car. It should be noted that we do not take into consideration the cost of experiments, tools, patterns, &c.

necessary to establish the actual type of car supplied by a manufacturer, but take a model which is so popular and standardised that all the initial costs of production have been written off.

On a powerful car, which has a small clientele, and, of course, a comparatively limited output, these items are of considerable importance. In the cost of a car one has to consider:—(1) The raw material; (2) the workmanship; (3) the general expenses and normal profit of the manufacturers and retailers. The Germain works have compiled the following table, showing for their principal type of car, viz., the 14-h.p. Chainless, the cost of raw material and parts which must be purchased before commencing to manufacture a series of chassis.

Table of raw material used in building a Germain chainless chassis:—

| | |
|--|----------------|
| Tyres... | 21.7 per cent. |
| Steel... | 10.6 " |
| Aluminium castings... | 9.2 " |
| Axles... | 8.4 " |
| Rubber tubing, aprons, nuts, bolts, &c. | 8.2 " |
| Magneto and fittings... | 8.2 " |
| Ball bearings... | 7.4 " |
| Radiator... | 6.4 " |
| Chassis... | 3.8 " |
| Bronze castings... | 3.4 " |
| Forgings... | 2.8 " |
| Springs... | 2.6 " |
| Cast iron... | 1.8 " |
| Steel tubing... | 1.5 " |
| Paint work... | 1.4 " |
| Lubricating materials... | 1.4 " |
| Wood-work... | 1.2 " |

100 per cent.

From an examination of this table one can deduce some very interesting points. The proportion of tyre cost is somewhat astonishing, and the first question to be taken into consideration is the great importance of the weight of a car, this weight being the criterion of the initial cost of tyres as well as their upkeep afterwards. The second item of cost is steel. In a car of the 14-h.p. Germain type, 1,300 lbs. of steel of various types and qualities in the rough are required. One penny in the cost of each lb. saved would therefore reduce the cost by £5 8s. 4d. The price of steel can vary from a few pence per lb. to 2s. and more per lb., and one can imagine what difference it can make in the cost of a car to use good or common steel.

By replacing aluminium with cast steel or iron a new economy would be realised, but again the important question of weight would interfere, and the economy would only be for the manufacturer. Then comes the front axle, a point on which rests the safety of the occupants of the car. A good axle costs anything up to £20, some racing axles costing £70 or more, whereas a cheap axle can be bought for £2 or £3. To all outward appearance they are identical, and nobody would be able to recognise the good one from the cheap one simply from inspection.

An expensive magneto and a good radiator can be replaced by common and cheap types, but with this reduction in price there would be a proportional increase of possible breakdown. The sundries and other parts come to a more moderate proportion, and certainly an economy could be realised on most of this material. Having the material, then comes the cost of time of manufacturing same. Of course we presume on absolute standardisation, without which one cannot have a perfect motor-car. With a good equipped works, well designed tools, and if the cost of labour is not excessive, the men's time expended on a chassis amounts to about 10 per cent. of its value.

What is more expensive and important is the case-hardening and tempering, and then the necessary rectification of all the working parts. If these operations are not made, which is often the case in cheap cars, the machines at the beginning would certainly look identical, and the cheap one would run as well, if not better and more silently, than a car more conscientiously made, but after a time all the soft moving parts would start to wear and then rapidly the car would go to pieces, and it would be impossible to have it repaired. Case hardening, tempering and rectification are expensive operations, but the only guarantees against wear and tear.

The general expenses, advertisement and normal trade profit which then come add to the price of a car. These are generally in good firms in proportion to amount of output, and are points which it is more difficult to account for. To sum up, two cars absolutely identical from outside appearance and running as well as each other may vary in value and price up to about 40 per cent. Many buyers are not in a position to realise the difference between these two cars when new, and a trial run cannot give them any guarantee. There is only one point, their confidence in the firm they deal with, and of its stability and experience.

The value of a good motor-car cannot come below a certain sum, and personally we believe that the actual prices in the majority of cases are perfectly normal, and cannot become cheaper, but most probably go higher, as the manufacturers will shortly see that, at these prices, they cannot make the necessary profit to keep alive their industry, which has this drawback, that it rises and falls according to fashion.—Yours truly,

THEO. MASUL.

MESSRS. MARTINS, Bow Bridge, E., have sent us a photo of a 20-h.p. Orion lorry they have recently supplied to the London School Furniture Company, of Islington, N.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Technical Department of the R.A.C. has received several enquiries with regard to the certified trials of tyres; and its resiliometer is being frequently used for measuring the yield and return of the tyre when subjected to concussion.

Arrangements are also being made for similar trials of the amount of oil consumed by a car of well-known make. The club's speedometer-calibrating instrument is much in demand, members realising that an accurate speed recorder may mean all the difference between a conviction and a dismissal in the police court.

The Guernsey Motor Association has decided to become associated with the R.A.C. at the beginning of 1909.

New members of the R.A.C. include the Hon. E. G. Spencer-Churchill, Colonel Sir Alan Colquhoun, Sir Joseph Jonas, and the Rt. Hon. Thomas Lough, M.P.

MOTOR UNION.

It was reported at the monthly meeting of the Motor Union on the 17th inst., that during the first eleven months of the present year £4,648 had been received in deposits from British and American members for custom duties deposited for Continental tours. The Finance Committee reported that in the same period the receipts had been £15,272, as against £9,887 in the corresponding period of 1907. A committee was appointed to arrange the model direction post to be issued by the Union for placing near schools. A ladies' reception committee was also appointed for provin-

SCOTTISH.

THE General Committee have considered the matter of the Scottish Reliability Trial in 1909, and the recommendation of the Trials and Competitions Committee has been adopted to the effect "that the trial should comprise 1,000 miles, and should take place in the week commencing June 14th, 1909," and the matter was remitted to the Trials Committee with full powers to frame and issue regulations and to carry out the trial.

AT the last meeting of the Council of the Incorporated Institution for Automobile Engineers reports were presented with reference to the formation of the Birmingham and Coventry centres of the Institution.

ON Thursday of last week Mr. C. Y. Knight gave a lecture to the members of the Midland A.C. on his "Silent Knight" engine.

ROAD REPORTS.

EALING.—A memorial has been forwarded to the Ealing Town Council on behalf of a large number of residents of Hanger Lane and district, drawing attention to the speed at which motor-cars are constantly driven along Hanger Lane to the danger of foot passengers. The borough surveyor is, as a result, communicating with Inspector Andrews, of the Ealing police, on the subject. The question of the nuisance caused by the noise and emission of grease on the roads from motor-omnibuses is also being dealt with in a similar way.

ISLEWORTH.—The Middlesex County Council Highways Committee have declined to support the application of the Heston and Isleworth Borough Councils for a speed limit for motor-cars on the London main

A Reminiscence of the 1903 Reliability Trials.—The Cars at the Hotel Metropole, Folkestone.

cial meets, and it was decided to issue a small button badge to motor-cycling members.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

ON the 17th inst. the fourth annual general meeting of the Cycle and Motor Trades Benevolent Fund was held at the Holborn Restaurant, London, with Mr. Albert Brown in the chair.

It was reported that the number of members and subscribers had more than doubled during the year, the total at present on the books being 1,406. The contributions received from the motor trade since the S.M.M.T. gave its donation amounted to £571. The balance sheet, which showed a total of £6,770 standing to the credit of the fund, was then adopted.

The list of ex-official councillors having been read, the following were elected for the motor trade:—Messrs. H. Burford, W. H. Harby, W. Hill, W. Johnson, W. M. Letts, and F. W. Shorland. Following the annual meeting, the Council met, with Mr. Ernest Brown in the chair.

WELSH.

THE second annual dinner of the Welsh A.C. has been held at the Hotel Metropole, Swansea, with Capt. D. Hughes-Morgan, J.P., in the chair. The Hon. Stephen Coleridge responded to the toast of "Motoring," which was in the hands of Mr. T. J. Williams; that of the "Motor Union," proposed by Mr. Basil Valentin, was replied to by Mr. Rees Jeffreys. Councillor D. Davies proposed "The Welsh A.C.," and in response Capt. Hughes-Morgan said it consisted of 180 members and was proving of considerable service to motorists in the Principality.

road at Isleworth, being of opinion that there are no special circumstances which suggest that the road is specially dangerous for motor traffic.

SUNBURY.—The Sunbury District Council have decided to apply for a ten-mile speed limit to be fixed for motor-cars using Staines Road from Shear's Corner to the George Inn, and in Thames Street from Halliford Road to French Street.

RULE OF THE ROAD.

THE Chief Constable of Preston has recently taken steps to secure the better regulation of street traffic, and the more strict observance of the rule of the road. A circular issued to drivers some weeks ago directed attention to the bye-laws, and conveyed the warning that unless these were obeyed offenders would be summoned. At the Preston Police Court, a few days ago, three drivers were each summoned "for driving a cart and not keeping the same on the left or near side of the road." P.C. Fleetwood stated that defendants drove their carts along the centre of Broadgate, and inconvenienced traffic overtaking them. The Chief Constable pointed out that the police did all they could to control the traffic, and in the narrow streets it was essential the bye-laws should be obeyed. The Chairman (Mr. J. Toulmin) agreed, and said it was imperative the rule of the road should be observed. A fine of 1s. and costs, or in default seven days' imprisonment, was imposed in each case, but it was pointed out that the Bench would probably take a more serious view in future cases.

MESSRS. HOLLICK AND PRATT, motor body builders, have removed to larger premises at Mile Lane, Cheylesmore, Coventry.

THE FUTURE OF ALCOHOL AS A MOTOR FUEL.

THAT a majority of motor-car owners and manufacturers refuse to seriously entertain the claims of alcohol as the coming fuel for their motors is due to the fact that they have as yet experienced no difficulty in obtaining all the petrol they require at moderate prices; while the cost of denatured alcohol, compared with that of petrol, remains prohibitive; in addition to which the physical characteristics of alcohol show this fuel at a decided disadvantage with petrol when used in the ordinary petrol engine. In reviewing the subject indicated by the title of this article it therefore becomes necessary, remarks Mr. Frederick W. Barker in the New York "Motor," to consider (1) whether petrol can continue to supply the increasing demand for motor fuel, (2) provided petrol fails to meet the increasing demand, why alcohol should be its successor, and (3) in what manner alcohol may be expected to approximate the results of petrol in the low compression, high-speed motor.

In the first place, the whole art surrounding the automobile motor has been built up in the past quarter of a century with petrol as the fuel, and the engines, with moderate compression and short piston stroke, are the direct result of mechanical skill displayed in utilising to the fullest extent the peculiar qualities of petroleum spirit. Although it is argued by geologists that the world's sources of petroleum are limited, and the supply cannot be kept up at the present rate of consumption, yet that supply is so large that it is difficult to grasp the idea of its becoming inadequate. A reason nearer comprehension why the cost of petrol may be expected to go up considerably in the near future is that as, roughly speaking, twenty gallons of petroleum must be handled in the distillation of one gallon of petrol and the demand for the lower distillates and products is not growing in anything like an equal ratio with the demand for petrol, it cannot much longer be profitable to market petrol at the prevailing prices. Could the petroleum owners find a commensurate use for paraffin their problem would be simplified; but, notwithstanding all attempts in the past, this distillate has not as yet been found generally suitable for power purposes.

When the fuel demand for pleasure automobiles can be so great as to create solicitude concerning the supply, it is surely proper to study this question even more closely in connection with the much greater impending demand, as the commercial motor vehicle for the transportation of goods, cabs and buses come more generally into use. These latter fields are only just beginning to be opened up, and have doubtless lain fallow largely on account of certain phases of the fuel question—to wit, the uncertainty regarding the cost of petrol and the danger attending the storing and handling of this fuel.

With the general use of the internal combustion motor for business purposes, it can readily be seen that the consumption of fuel will be enormous, and hence, with the approach of that era, the economic side of the fuel question is rapidly becoming acute. In France and Germany it has been foreseen for years past that the petrol supply would become inadequate, and the Governments, as well as private enterprise, have sought to provide a substitute. That petrol is as fine a fuel as can be desired is conceded by all, but the fear of its passing is so pressing that Continental legislatures have passed laws removing the taxes on alcohol, have encouraged the farmers to grow crops rich in alcohol-yielding constituents, and have offered rewards for practical means of using alcohol in petrol engines. All these indications point to the coming of a time, which, though it may be deferred for several years yet, is surely near at hand, when a sharp rise in the price of petrol will announce the fact that the supply is insufficient to answer the requirements.

With a shortage in the petrol supply the motor vehicle industry and adherents, as well as the users of motor-boats and stationary engines of the internal combustion type, will apparently be face to face with the problem of either paying an exorbitant price for fuel, or of changing over to another form of engine. It seems, therefore, to be within the province of economists to consider the merits of other existing fuels in an endeavour to provide a substitute for petrol for use in the present motors. The prime consideration for such a fuel must be its availability in sufficient quantities to warrant its fulfilling all possible demands, of course at a price which will not retard the development of the several industries with which the internal combustion engine is allied. It is a *sine qua non* that the new fuel must give service approximating that of petrol.

In considering the claims of various fuels to in part or wholly take the place of petrol only three kinds have received serious consideration by investigators. They are petroleum, benzol, and alcohol. Of these the first two are handicapped because limited in production, alcohol alone being capable of production in unlimited quantities throughout the world. While under certain conditions petroleum furnishes ample power, it is less elastic than petrol in the proportions with which it may be mixed with air to effect good combustion, so that variation of the mixture is only practicable within narrow confines, and it is necessary to run the engine almost at a fixed load. In automobile practice this deficiency involves a more frequent use of the change-speed gear, the penalty for a liberal use of the throttle being poor combustion, the rapid accumulation of carbonaceous deposits on the valves and sparking-plugs, and foul exhaust. Petroleum being harder to volatilize than petrol, requires the addition of heat before it is introduced into the combustion chamber. A great variety of means for applying this heat have been devised, and some petroleum motors are in the market equipped to do good service. But it is due to the peculiar characteristics indicated that this fuel is not generally used and is unawaited to take the place of petrol.

Benzol, which is a product derived in the distillation of coal tar, is, even at the present time, too high in price to appear as a serious claimant to the position now occupied by petrol, and should there be a large demand for this product, its cost would become prohibitive because of its comparatively meagre sources of supply. Benzol appears to serve about as well as petrol in the cylinder, excepting that the exhaust is more obnoxious, and there is more tendency to foul the motor.

With regard to alcohol, when considered from the standpoint of a sufficiency, we find this fuel to be absolutely unlimited in production, its sources being practically all of a vegetable kind, and there being a wide range of crops containing starch or saccharine matter, such as corn, potatoes, beets, sugar cane, peat, &c., from which alcohol can be economically produced. In Cuba alcohol made from molasses is sold for 5d. a gallon. In Germany, where it is chiefly made from potatoes, and where a splendid system of distribution has been established, alcohol is procurable at approximately 1s. 1½d. a gallon all over the Empire.

The price in France is about 1s. 2d. a gallon, beets being largely used in its manufacture. Although alcohol is more extensively used in Europe than in the United States, the demand there is not yet of so vast a character as to warrant its production on a sufficient scale to permit lower prices to rule. Such large demands can only come through the general use of denatured alcohol by internal combustion engines, and thus it appears to be a question in this case of the demand leading to the creation of the supply. Certainly commercial alcohol cannot be cornered by trusts or corporations any more than whisky and other potable spirits. Just as the demand grows so will capital be forthcoming to erect distilleries and engage in the production of commercial alcohol whenever and wherever there appears a demand for it as a staple. Chemists the world over are engaged in working out processes for the economical production of alcohol from various kinds of vegetation, and unless all signs err we are on the verge of making a very broad utilization of this substance, all of which means that the cost of manufacture will be low and its availability most extensive.

The boiling point of alcohol is about 170 deg. Fahr., so that instead of volatilizing like petrol at moderate temperatures, the addition of heat is necessary to vaporize it. While this condition involves some difficulties in carburation, it is a factor of safety in handling and storing. Another important feature lies in the fact that the exhaust from alcohol is odourless and smokeless. In this connection it should be noted that in those thoroughfares of large cities where there is a congestion of motor traffic the nuisance arising from incomplete combustion of petrol mixtures is becoming intolerable. No doubt a good deal of this trouble is caused through the carelessness of chauffeurs in using wrong proportions of fuel and air, and sometimes through a too liberal use of cylinder oil; but the root of the evil lies in the narrow range in the different quantities of petrol which when mixed with air form good burning mixtures.

(To be concluded.)

AUTOMOBILE ACCIDENTS.

A MOTOR accident took place in the west-end of Folkestone early on Sunday morning. P.C.'s Earle and Nash were examining a lamp-post which had been recently damaged, it is thought by a motor-car. A horse-cab was standing near the policemen, when suddenly a motor-car came down the road. The vehicle dashed into the horse-cab with such force that it was completely overturned, and the two policemen were buried beneath it. They were rendered unconscious, and could not move. The constables, still unconscious, were taken to the local Victoria Hospital.

The driver, a man named Herbert, was arrested, and subsequently charged with furious driving and causing serious bodily harm. On Monday he was remanded from the local police-court, it being asserted that he was driving at a great speed, and was also under the influence of drink.

At a Hammersmith inquest, on Monday, on Frederick Thompson, who died from injuries received in a motor-car accident, all the witnesses agreed that the old gentleman, as he was crossing the Chiswick High Road, hesitated and then started forward again. The car was going at a very slow pace, Mr. John Cleave driving. The coroner asked why, as Mr. Cleave was driving very slowly at the time, he did not stop entirely when he saw the man hesitate. Mr. Cleave replied that he frequently did pull up in the case of a lady. The coroner.—But why differentiate between a lady and gentleman?—Because I expect a man could be able to make up his mind more quickly as to which way to go. The jury, in returning a verdict of "Accidental death," expressed the opinion that Mr. Cleave ought to have pulled up, and desired to caution him as to his future driving.

A WONDERFUL performance for a small car was accomplished on one of the hottest days of last summer by Mr. G. V. T. Montefiore, Rochester, who, driving his 10-12-h.p. Humber, successfully climbed a very steep rise on the Old Wyche Road at Malvern. The surveyor to the Malvern Urban District Council has officially certified that the slope in question is 1 in 5 for a length of nearly 500 yards, whilst the portion near the summit has a gradient of 1 in 3.4 feet. The length of the hill altogether is approximately one-third of a mile. Mr. Montefiore has been informed in Malvern that only one other car has ever climbed the hill, although many have made the attempt.

CASES AGAINST MOTORISTS.

SULTAN OF ZANZIBAR'S CAR.

Thomas Sopwith, of 83, Cadogan Gardens, Chelsea, was summoned at Edgware, on the 17th inst., for exceeding the speed limit with a motor-car, and failing to produce his licence. Mr. Staplee Firth defended. P.C. Tallin said that when defendant was stopped he said, "I don't think you can interfere with me. I have orders to drive fast, as I have Royalty on board."

Mr. Staplee Firth, in defence, said that the defendant was driving the Sultan of Zanzibar, and his instructions were that the car was being driven at about twenty miles an hour under the orders of the Sultan. Mr. Firth also contended that the Bench had no jurisdiction in this case, as all sovereigns were exempt from this law.

Sir William Gilbert said the Court was very anxious not to do anything that would strain the diplomatic relations between Great Britain and Zanzibar, and would therefore adjourn the case for the production of an authority in support of Mr. Firth's contention.

DISMISSAL.

On the 16th inst., Mr. H. Jungbluth was summoned at Brighton for driving a motor-car at a dangerous speed on Grand Junction Road. The police evidence was to the effect that the defendant drove at about twenty miles an hour. The witnesses for the police were two taxi-cab drivers, one of whom gave his version of the speed at fifteen miles an hour and the other as twelve. The defendant, giving evidence on his own behalf, agreed with the latter witness, and after a brief consultation with his colleagues the Mayor dismissed the case.

CHANGE OF ADDRESS.

On the 18th inst. the Princess Wiasemsky, of Reigate, was summoned at Brighton for being the owner of a car and failing to inform the Council, with whom the car was registered, of the change in her address. The Deputy Town Clerk said that this was the first case of the kind that had occurred at Brighton, and under the circumstances he asked that it should be withdrawn—a course which the Bench allowed.

ON THE MENAI SUSPENSION BRIDGE.

At Llangefni, on Monday, A. C. Davies, of Treffoo, Anglesey, and Dr. Lloyd Roberts, of Carnarvon, were each charged with exceeding the four-mile speed limit over Menai Suspension Bridge, which is owned by the Government, this being the first prosecution of its kind. Evidence in the first case showed that defendant's speed was from eight to ten miles an hour. For the defence it was argued that a speed limit of four miles for motor-cars was unreasonable low, and that the regulation was honoured more in the breach than by observance. The Bench found that a technical offence had been committed, and ordered defendant to pay the costs, a similar result being come to in the other case.

MOTORIST AND MAGISTRATE.

Before Justices Walton and Jelf, in the King's Bench Division, on Monday, Mr. Tindal Atkinson, K.C. (with whom was Mr. Moresby White), applied on behalf of Mr. M. L. Braithwaite for a rule nisi calling upon Mr. Plowden, Police Magistrate, to show cause why a writ of *certiorari* should not issue to bring up, for the purpose of being quashed, an order directing that Mr. Braithwaite's licence to drive a motor-car should be endorsed and a conviction imposing a penalty of 20s. and 5gs. cost for non-production of the licence. On May 12th, counsel said Mr. Braithwaite was summoned for driving his motor-car in Regent's Park at a speed exceeding ten miles an hour. Mr. Braithwaite was unable to attend the Court, and he sent his chauffeur. The magistrate, however, declined to proceed with the case in the absence of Mr. Braithwaite, and adjourned the hearing for his personal attendance. On the day fixed for the adjourned hearing Mr. Braithwaite was again unable to attend, and the magistrate convicted him and ordered him to produce his licence for endorsement. Mr. Braithwaite did not comply with this order, and a summons was issued against him under the Motor-Car Act, 1903, charging him with having failed to produce his licence within a reasonable time for the purpose of endorsement. He was convicted, and ordered to pay a fine of 20s. and 5 gs. costs. Counsel contended that the regulation under which Mr. Braithwaite was convicted of having driven his car at an excessive rate of speed was made under the Parks Regulation Act, 1872, which contained no provision for the endorsement of a motor-car licence, and that therefore the magistrate had no jurisdiction to direct that Mr. Braithwaite's licence should be endorsed, or to convict that gentleman for not producing his licence for the purpose of being endorsed. The court granted a rule nisi.

Fines amounting to £100 were imposed on motorists at the Barnet Sessions on the 17th inst.; on Saturday several drivers were charged for driving at an excessive speed on the Great North Road.

THE Anglo-American Oil Company, Ltd., have decided to reduce the price of Pratt's Perfection motor spirit in tin to the trade 4d. per gallon.

THE Gas Lighting Improvement Company, Ltd., have decided to reduce the prices of their "Carburine" and "Glico" motor spirits by one halfpenny per gallon.

A SUCCESSFUL sale of second-hand cars was held by the Brompton Motor Company, of 78, Brompton Road, London, S.W., at the Cadogan Rooms, Hans Road, W., and Messrs. Arkwright, Koecher, and Williams, the proprietors of the Brompton Motor Company, are so satisfied with the result that they contemplate holding them monthly.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE VULCAN MOTOR AND ENGINEERING COMPANY, LTD.—Mr. Walter Hamer presided at the second annual meeting of the shareholders of this company held at Southport a few days ago. Mr. Thomas Hampson, the managing director, explained that the accounts were made up for eleven months only, during which time the deficit of the previous year had been cleared off and a credit balance placed to the profit and loss account. Orders had been secured for Vulcan cars which would ensure plenty of work for some months to come, and the London and Parisian Motor Company had been appointed agents for them in London and the South of England. The works manager, Mr. Joseph Hampson, said that the stock was as low as it could be for turning out the work at a competitive price. It was mentioned that the question of making motor-cabs was under consideration, and the report having been adopted unanimously, a vote of thanks to the chairman concluded the proceedings.

SOCIETE FRANCAISE DES PNEUMATIQUES DUNLOP.—The report for the year ended July 31st, 1908, stated that the balance of profit brought forward was £28,590. Including interest, and after making provision for management expenses, directors and auditors' fees, reserve for bad debts and depreciation, there was a net loss on trading during the year of £11,744, leaving a balance of £16,845. The directors can only recommend the dividend on the preference shares at the rate of 6 per cent. per annum for the period, leaving £13,851 to be carried to next account. The directors believe this set-back to be altogether of a temporary nature, and that beyond the loss of the moment the future of the business has not been seriously affected.

THE Metropolitan Auto Cab Company, Ltd., has been registered with a capital of £100,000 and offices at 46, Gresham Street, London, E.C., to place motor-cabs on the streets of London. Two hundred and thirty

Dr. Mortimer Johnson on his Humber Car in Barbadoes.

Vinot cabs are to be supplied within twelve months, and the St. Pancras Iron Work Company, Ltd., has agreed to maintain and see to the upkeep of the vehicles for five years.

CENTRAL GARAGE.—£5,000 (£1). To take over the business of a motor garage proprietor carried on by Thomas Dyson, Ltd., at 4, Town Hall Square, Bradford. (100,651.)

H. G. NORTON AND CO.—£15,000. Motor-car, aerial machine and cycle engineers and agents, &c. To take over the business of Mr. H. G. Norton, trading as H. G. Norton and Co., in Cheltenham and Gloucester. Private, 1-6, Bath Road, Cheltenham. (100,655.)

ROLLS-ROYCE, LTD.—The report for the year which ended on October 31st last shows a net profit of £9,063 7s. 11d., which, with the amount carried forward, makes a disposable balance of £10,243 6s. 7d., and the directors recommend that a dividend of 6 per cent. be paid on the amount paid up on the preferred ordinary shares, and that the plant and preliminary expenses are to be written down to the extent of £5,375 11s. 8d. and the balance of £1,021 0s. 6d. is to be carried forward.

CAR AND GENERAL INSURANCE CORPORATION, LTD.—Mr. E. Manville presided at the fifth annual meeting of this company, held on Friday of last week, and regretted that for the first time in the life of the Corporation the results as shown on the balance-sheet did not indicate the considerable progress that had been experienced in a marked degree from year to year. In this reckless and unintelligent rate of cutting of competitors had been a factor. At the same time the foundations of the company were solid, good and substantial, with a net premium income of £174,000. The statement of accounts was adopted after some discussion, and a vote of thanks to the chairman closed the proceedings.

DUNLOP PNEUMATIC TYRE.—Mr. Harvey du Cros presided on the 17th inst. at the general meeting of the Dunlop Pneumatic Tyre Company (Limited) and said that he could congratulate the shareholders upon the result of the past year's operations, for it had been a very good one for the company. He thought that the shareholders would be well satisfied with the position and prospects of their company, for since the year 1896 they had distributed by way of dividends no less a sum than £1,595,720. The company had secured excellent results at a period when both the cycle and automobile trades had been bad. It could be taken that the profits shown had been made at a period when things were at their very worst. If there was an improvement in trade the business of the company would also show corresponding improvement. He felt that he was justified in expressing confidence as to the future of the company. The only competition which they had to consider came from Germany and France. In conclusion, the Chairman dealt with an invention for the rapid changing of punctured motor tyres and drew attention to the sample wheels shown in the hall, upon which the operation of changing was demonstrated by mechanics. He further made reference to the proposal for establishing a factory in Japan, and said that a meeting of shareholders to consider the question would be called at an early date. The report was adopted.

REGISTRATIONS which were notified during the last few days have been those of Messrs. Huntley Walker and Co., with a capital of £5,000 in £1 shares, the Marble Arch Garage, Ltd., with £3,500 in £1 shares, and the Mercedes Cab Company, the capital of which is £100.

F.I.A.T. MOTOR-CAB COMPANY.—The report for the period August 1st, 1907 (the date of the incorporation of the company), to November 24th, 1908, states that considerable delay was experienced in the delivery of the cab chassis, but recently these have been coming forward satisfactorily, with the result that the company have now 180 complete cabs. This number is being added to almost daily. The delay before referred to, the instruction of drivers, the work of organisation, and the loss of revenue from forty cabs, for a period of about four months, which were prevented from plying for hire owing to the dispute with the Thames Bank Wharf Motor Works (the maintenance contractors), have naturally affected the first profit and loss account, and, after allowing for depreciation on the company's cabs, the debit balance carried forward amounts to £3,766. The company's cabs are now running efficiently, and the average revenue being earned is in excess of that estimated at the formation of the company. The garage is now situated at 10, Pancras Road, adjoining King's Cross and St. Pancras Stations. The balance-sheet shows that the expenditure to date on cabs and cars, including deposits on chassis and bodies, is £92,038. Plant, machinery, tools, furniture and fixtures stand at £1,200 and the stocks on hand at £3,238. The preliminary expenses amounted to £10,550, underwriting commission to £15,000, and brokerage to £1,874. There is a suspense account of £8,725, and the cash at bank and in hand amounts to £7,481.

MR. J. S. SMITH-WINBY presided at the meeting of the Darracq-Serpellet Company on Monday. He spoke of the severe competition among the motor-bus companies of London. On the Continent appearances were improving. He moved the adoption of the report, which was seconded by Mr. R. L. Harmsworth and agreed to.

AERONAUTICS.

MR. E. STUART BRUCE has suggested to the Royal Meteorological Society the necessity of establishing a national aerial observatory in this country for the investigation of the upper air.

The following have been appointed to serve on the Committee of the Institution of Automobile Engineers to collect information with regard to aeroplanes: Mr. Dugald Clerk, Dr. H. S. Hele-Shaw, Col. R. E. Crompton, Capt. L. A. Kingston, Messrs. F. W. Lancaster, Mervyn O'Gorman, F. R. Simms, G. J. F. Knowles, J. S. Critchley, D. J. Smith, L. A. Legros and Sir Hiram Maxim.

It has been suggested to the Council of the Society of Motor Manufacturers and Traders that an aero section should be formed to deal with any matters of interest under the above head.

The Council of the Society of Engineers has awarded the Bessemer Premium of Books to Mr. Herbert Chatley, for his paper on Mechanical Flight.

BUSINESS NEWS.

A NEW preparation, known as "Tirecote," for preserving motor-tyres, has lately been put on the market by the Eagle Rubber Mills, Eagle Wharf Road, London, N.

MESSRS. MAXFIELD AND COMPANY, Birmingham, inform us that they entered one of their auto-tyre inflators, through their French agents, for the competition of such devices lately held by the French Automobile Club. Unfortunately the apparatus was delayed in transit; in fact, up to the 18th inst. it had not reached its destination, and Messrs. Maxfield are consequently claiming compensation from the railway company.

COVENTRY chains were fitted on the first, second, third and fourth cars to finish in the recent A.C.A. Grand Prize race in Savannah.

IN celebration of their forthcoming taxi-motor cab service for Wimbledon the proprietors of the Wimbledon Motor Works, Messrs. Oates Bros., recently entertained their employees to dinner at their High Street Garage.

THE British Petroleum Company, Ltd., announced on the 17th inst. that their "Shell" and "760" motor spirits were then reduced in price one halfpenny per gallon.

FORTHCOMING EVENTS.

DECEMBER.

30th.—Heavy Motor Vehicle and Aeronautical Display closes at Paris.
31st (Th.).—Entries close for Grand Prix of A.C.F.

JANUARY, 1909.

1st (F.).—Anniversary of the Motor Car Act, 1903, coming into operation.
7th (Th.).—Annual Dinner of the Yorkshire A.C. at Leeds.
8th (F.).—Annual Dinner of the Nottinghamshire A.C.
Mr. C. Y. Knight will lecture on his engine to the Manchester and District Motor Trades Association.
12th (Tu.).—Extraordinary General Meeting of the Automobile Association.
14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
16th-25th.—Brussels Motor Show.
21st (Th.).—Annual General Meeting of the Southern Motor Club.
22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
23rd (S.).—Annual Dinner of the Coventry Motor Club at the Craven Arms Hotel, Coventry.
26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.R.H. Prince Francis of Teck will be among the guests.
4th (Th.).—Annual Dinner of the Southern Motor Club.
19th-27th.—Manchester Motor Show.
24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
Motor-Car Show at Barcelona.
20th-27th.—Cordingley's 14th Annual Motor-Car Exhibition and Market, Agricultural Hall, London.

JUNE.

14th (M.).—Commencement of the Scottish Reliability Trial.

LIGHTING-UP TIME—LONDON.

FROM the Star Engineering Company comes a copy of the 1909 catalogue of the well-known Star cars. For the forthcoming season no less than seven models are being turned out, viz., 8-h.p. and 10-h.p. two-cylinder, 12-h.p., 15-h.p., 20-h.p., and 25-h.p. four-cylinder, and 40-h.p. six-cylinder. The list gives very complete particulars of each of these types, while several pages are devoted to particulars of the bodies which may be fitted to the chassis. The catalogue is well illustrated and concludes with a number of pages giving reproductions of letters from satisfied users of Star cars, which, in view of their relatively low prices, are of special interest to motorists of moderate means. We would specially refer to the 15-h.p. car, which is fitted with an engine giving under the R.A.C. rating 20-h.p.; the Bosch type of high tension dual ignition is provided, as also a White and Poppe automatic carburettor. Throughout the details are on the most up-to-date lines, and fitted with either an open or covered body it should prove not only a quiet-running vehicle, but one which is economical in upkeep.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27 33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, JANUARY 2, 1909.

[No. 513]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

PRIZE COMPETITION.

AS announced last week, we offer a prize of two guineas for the best original short story of motoring interest suitable for publication in the *M.C.J.* The story should be between 1,000 and 1,200 words in length, and the main incident should, of course, centre about the automobile.

The latest date for submitting the MSS. will be the first post on Saturday, January 16th, 1909, and the award will be notified as soon as possible after that date, the Editor's decision being final.

With reference to the stories which do not win the prize, the right is reserved to publish any which we may deem suitable, making payment at our usual rate of remuneration.

All MSS. should be forwarded addressed to the Editor, *M.C.J.*, 27-33, Charing Cross Road, London, W.C., the envelopes being marked "Short Story" on the top left-hand corner.

COMMENTS.

The Butterfly and the Beetle.

SUCH are the only terms by which to express an opinion of the Exhibition which was in progress at the Grand Palais in Paris until Wednesday last. A more incongruous mixture of exhibits was never seen, and although both classes suffered from their contiguity, it was the heavy vehicles which were the greater victims. They could not be ignored, inasmuch as they occupied the centre of the hall, but they did not appear to attract attention. There was no doubt that the tens of thousands who attended the display were drawn to the Grand Palais by the Aero section, which was indeed a remarkable one and showed a great advance upon that which was held two years ago in the Agricultural Hall, London.

The Commerce of Aviation.

WONDERFUL as has been the progress of the automobile on the road, it is nothing in comparison with the strides made during the last two years in Aeronautics. It has now been proved without doubt that flight by means of "planes" heavier than air is not only possible, but that they are really dirigible. As in the progress of automobilism engineers are now beginning to centre their attention on the production of engines specially lightened to suit the new conditions. How earnestly and enthusiastically this is being done was shown at the Salon. The ultimate intention of those who have given most thought to this matter is that the weight of the engine shall not exceed one kilogramme per horse power. Already this desideratum has nearly been obtained in the Gobron-Brillie engine, that on view being one of eight cylinders with sixteen pistons, as also in the Farcot described elsewhere in the present issue.

Christmas Motoring.

NOT for years has Christmastide been associated with such ideal motoring weather as prevailed last week-end, and of which full advantage was taken by automobilists. We were out on the Portsmouth road on Christmas morning, and it was a real pleasure to see car after car come bowling along, each with its merry party. King Petrol was again much *en evidence*

on Boxing Day, when quite a number of motorists wended their way to Burford Bridge, at the foot of Boxhill, where a record meet of the Surrey Union Foxhounds took place. The scene outside the old hostelry was a memorable one, the red-coated huntsmen having to wend their way through a long line of motor-cars and a crowd of interested spectators. A wonderful change came over the scene on Sunday, with the result that roads which only a few days ago were as clean as the proverbial whistle are now covered with snow. No doubt many motorists will have strange tales to tell of their adventures when out driving during the past few days, and, needless to say, should any readers have had novel experiences of this kind we shall be glad to hear from them.

The Cold Snap.

THE year went out with a cold snap indeed, and the 29th ult. was a notable day in London. As the hours wore on and the snow continued to fall, traffic was carried on under increasingly difficult and slippery conditions, until by the afternoon even such a busy thoroughfare as the Charing Cross Road became a deserted highway, and the silence was only broken occasionally by the rumble of a motor-car pursuing its way heedless of the conditions of the street. Motor-buses struggled along gamely enough until their number became appreciably less, while much of the horse-drawn traffic was entirely suspended. At these times such hints as were recently given in our article on Cold Weather Precautions become of primary importance to the motorist, who has to consider his car as an occupant of the garage as well as a moving force on the road.

Mud and the Motorist.

THOSE whose business it was on Monday to make a peregrination of the deserted streets of London, to find most of the automobile establishments still closed for holidays, must have felt some consideration for the plea raised a few days ago by Colonel Hotham, who wrote to the papers complaining of being bespattered with mud thrown by the wheels of passing motor-cars. While walking a short distance on the Lymington and Brockenhurst road he was passed in half an hour by three automobiles, the drivers of which did not slow down when passing him. Result, he was splashed with mud from head to foot, despite the fact that he kept as far as possible to his own side of the track. Undoubtedly it would be well if motorists were careful of the comfort of pedestrians as well as of the convenience of other forms of wheeled traffic. But is not some of the blame to be directed towards the road authorities?

1909.

OPTIMISTS have taken heart during the last few days, and the orders that have been placed with makers of cars of good repute have lent a certain air of confidence to the New Year's greeting with which everyone is being assailed. This cheerfulness is encouraging to those who have seen a lull in trade-prosperity these last few months. Retrenchment is the order of the day in many leading establishments which have hitherto been distinguished by a lavish expenditure in diverse directions. The proprietors of these are beginning to recognise that the avenues of direct benefit are really few, and that they have to reach the pro-

spective motorist as well as those who have got beyond the initial stages by means of exhibitions in the spring and through the papers that motorists read all the year round. The lesson has not been quickly learned by several concerns, which, however, having had experience in many ways, are now seeing the truth of the statement.

A French Congress in London.

THE programme for the congress of the Ligue Internationale des Associations Touristes in July next, has been prepared, and includes the following events:—July 7th, arrival of delegates at the London headquarters, Hotel Great Central; 8th, official session of the congress and banquet. The sitting will be continued on the 9th, and the final session held on the morning of the 10th. The official tour will commence on the morning of Sunday, July 11th, leaving London for Oxford by way of Taplow and Reading. At the University city the headquarters will be the Clarendon Hotel. On the night of the 12th Leamington will be the stopping place, on the 13th Cheltenham, and on the 14th Swansea. On July 15th, the programme arranged by the Welsh A.C. will include visits to various local works and on the following day there will be speed tests at Pendine Sands. The Motor Union Committee meeting will take place on Saturday, the 17th, and the dinner in the evening, the return to London being arranged for Sunday, July 18th.

Mr. and Mrs. S. J. Cook, of Clifton, East London, on their 12-16-h.p. Daimler Car.

The above illustration is reproduced from the Christmas Card sent us by one of our South African readers.

Local Centres of the M.U.

A NEW development of the work of the Motor Union is the establishment of local committees which are intended to serve the Parliamentary Divisions of the counties in which they are formed. Thus it is hoped to bring the influence of the organisation to bear upon the representatives in Parliament more directly than can be done by associations which embrace larger areas in a less definite way. The plan has been inaugurated in the West Herts County Division, and Mr. Charles McWhirter and Mr. A. C. Bournier have been appointed chairman and hon. secretary respectively. Centres for the Mid and East Divisions of the county are about to be organised by Mr. T. Williams, of Watford, who has been appointed hon. secretary for the whole of the county, and a North Herts centre has also been established with headquarters at Hitchin, and Mr. P. H. Sharman as hon. secretary. Already a scheme of work has been outlined, and a deputation will wait upon the Hertfordshire County Council in a few days urging them to adopt three new bye-laws so that (a) All vehicles shall show a rear light from an hour after sunset until an hour before sunrise, (b) That all slow moving traffic shall be obliged to use the left hand side of the road, and (c) That men in charge of cattle or sheep on the public highways shall be com-

pelled to carry a light during the same hours that insistence is made upon the rear light of vehicles.

Contradictions on the Roadside.

IN connection with the efforts made to improve the surfaces of the roads of the country, and to bring the system of construction into keeping with modern demands, we trust the importance of efficient signposting will not be entirely overlooked. Many years have flown since anything like a measurement of the main roads was undertaken, and in many places the distances indicated on signposts are at variance with actualities. In others they are contradictory of each other, as is the case in the Lincolnshire village, a curiosity of which is reproduced on the opposite page. The discrepancy has probably arisen from the dual control with regard to indication posts and those which serve as distance recorders. That such a state of things could be allowed to continue until the camera brings the absurdity into publicity is scarcely creditable to the powers of observation among the responsible people. We want a really national overhauling of such matters with a view to securing uniformity and, of course, accuracy.

Rules for Motorists.

LAST week we gave some suggested rules for pedestrians anxious to escape the terrors of the streets. In the same vein are some further regulations prepared for the use of the Wasau (Wis., U.S.A.) Chauffeurs Club as follows:—

1. On discovering an approaching team, the automobilist must stop offside and cover his machine with a tarpaulin to correspond with the scenery.
2. In case a horse does not pass an automobile, the tarpaulin to the contrary notwithstanding, the automobilist will take his machine apart as rapidly as possible and conceal the parts in the grass.
3. The speed limit on country roads will be secret this year, and the penalty for violation will be £10 for every mile an offender is caught going in excess of it.
4. On approaching a corner where he cannot command a view of the road ahead, the automobilist must stop awhile, then ring a bell, fire a revolver, halloo, and send up three bombs at intervals of five minutes.
5. Automobiles must be seasonably painted; that is, so they will harmonize with the pastoral ensemble and not be startling; thus in spring, green; in summer, golden; in autumn, red; and in winter, white.
6. Automobiles running on country roads at night must send up a red rocket every mile and wait for the road to clear. They must proceed carefully, blowing their horns and shooting roman candles.
7. In case an automobile approaches a farmer's house when the roads are dusty, it will slow down to one mile an hour, and the chauffeur will lay the dust in front of the house with a hand sprinkler worked over the dashboard.

Speedometers on Cars.

IN the Parliamentary papers issued on the day following the prorogation of Parliament the President of the Local Government Board replied to several questions which had been addressed to him with regard to automobile matters. Mr. Bowerman, one of the thirty-five M.P.s who recently waited upon Mr. Burns with regard to motoring matters, suggested that regulations should be made compelling all mechanically driven vehicles to carry speedometers. Mr. Burns replied to the effect that the Royal Commission on motor-cars had considered the matter but had come to the conclusion that they could not recommend that, in respect to motor-cars, speed indicators should be made compulsory. So far as he was concerned, he could not see his way to depart from the recommendation of the Royal Commission in this matter. There is no doubt, however, that motorists are voluntarily following to a large extent the advice given by

Prince Francis of Teck and are fitting their cars with such instruments. Such precautions have proved of service in several instances in the police courts of late.

The Scottish Club.

AFTER many years of excellent work without a clubhouse the Scottish Automobile Club has now found a habitation which will doubtless be appreciated as the centre of motoring organisations north of the Tweed. The Club has just purchased the house at 11, Blythwood Square, Glasgow, which was formerly the town residence of Mr. Alexander Baird, of Gartsherrie, and which has been for the last twenty years occupied by the late Mr. Joseph Henderson, the well-known artist. The premises have a western outlook and comprise four flats, including the basement, with some public rooms of commodious dimensions. In addition there is a handsome saloon at the rear, erected above the stable and coach house, the latter of which will be converted into a motor garage with accommodation for a considerable number of cars belonging to members visiting the clubhouse from time to time.

A Diary.

THE Motorists' Diary and Year Book for 1909 comes to hand in a size convenient for the pocket, and containing 400 pages of useful information to owners of motor-cars. The legal section is contributed by Mr. C. C. Macklin, who has often rendered motorists considerable service in the Courts. That portion of the work referring to touring matters is complete, and in addition to particulars with regard to travel abroad contains much information as to the main roads in this country—not only so far as garages and hotels are concerned, but also with reference to the system of patrols established thereon by the A.A. The records of racing are brought up to the end of October, and the addresses of the makers of the best known British cars occupy several pages. This, too, has been carefully checked, although one or two corrections might be made, notably in connection with the entries relating to the Brotherhood, Buick and Thames cars.

Petrol Risks.

SEVERAL references have lately been made as to the necessity for the utmost care being exercised in dealing with petrol. It would appear from our Correspondence columns, notably from the letter from Mr. T. W. Kemp which appears in this week's issue, that many of the dangers that have been noticed and attributed to carelessness in motor garages can be traced to a more domestic source. One result of the discussion, however, should be to secure a general observance of care with regard to the allegations of the disposal of petrol in drains, and also a closer attention to the highly inflammable character of the spirit. Even in such weather as we have been experiencing its risk should not be ignored, for at temperatures as low as 32 deg. Fahr. it will evaporate naturally in quantities sufficient to form, with air, a mixture which may become highly dangerous.

The Lady Chauffeur.

CONSIDERABLE notice has been taken this week of the appearance at the wheel of a motor-car in London of a lady chauffeur known as "Miss Sheila O'Neill." This name is a *nom de plume* of the daughter of a military officer. She obtained both the Queen's and King's medals as a nurse in the South African War, and now wears them on her motor coat. She has been trained by Mr. A. R. Mills, the owner of a garage in the central district of London, which was recently referred to in these columns, who has already arranged some contracts which will secure her services being regularly requisitioned. The Scotland Yard authorities have not yet seen their way to grant licences to lady drivers to ply for hire with a cab on a rank; hence the necessity of getting over this difficulty by taking instructions from Mr. Mills instead of the "fares" she conveys. Miss O'Neill's first

experiences were sympathetic so far as the public were concerned, while the decoration of her 12-h.p. car with a metal figure of a policeman has evidently propitiated Robert; but Jack Frost has apparently given her a cold reception, and her arrival on the streets on Monday was followed by a real Arctic experience on Tuesday.

Ladies and the Car.

WHILE the Ladies' Automobile Club continues its way successfully and socially, the Motor Union is endeavouring to form a Ladies' Committee, the initial purpose of which will be to help the organisation of the forthcoming international meeting to be held at Swansea. Mrs. Joynson-Hicks, the wife of the chairman, is taking an active part in the matter, and the fact that there are 200 lady members of the Union should secure a good working committee being formed for this purpose. The interest that ladies have taken in the automobile movement has been very remarkable. From the early days they were eager participants of the pleasures of motoring, and now their interest is often keenly displayed in the mechanical parts of the car.

Contradictory.

At Navenby, near Lincoln, a milestone and guide post stand side by side, the former recording the distances to Grantham and Lincoln as 16½ and 8½ respectively, and the latter as 17 and 8.

The Good Driver.

WE agree with the writer in the "Times" who says that black sheep among the professional drivers of motor-cars were more numerous five years ago than now. The greasy, dirty mechanic with his swagger and half contemptuous manner has been educated into decorum, or has gone into some other business, and, as a rule, the present breed of motor drivers are intelligent, mannerly, and resourceful knights of the wheel. A good temper is a necessary quality in the making of an acceptable driver, and he must have knowledge beyond the technical matters which are, of course, the primary consideration. A smattering of French as well as a talking acquaintance with good English is an advantage; the habit of reading maps so as to take in the location at a glance, and a general interest in the legal position of motorists will be found useful. In fact, once the driver has acquired facility in mechanical matters, the way to take corners around which pedestrians may be crossing, the repair of tyres, the management of lamps, and the score of other "little things that matter," the wise driver will, by becoming a regular student of automobile literature, qualify for the higher positions which are open to those who add general knowledge to expert skill and understanding.

BRIGHTON'S MOTORING CHRISTMAS.

THE number of motorists who made Brighton their Christmas headquarters is, like the sum total of the thousands of smart people who flocked down to the popular watering place for the festive season, quite beyond computation. All the best hotels and boarding houses in the town—and, indeed, all the rest of lesser repute—were full to overflowing as they have never been before. The Metropole, where over a thousand people sat down to dinner on Christmas Day, the Grand, the Old Ship, the Royal York, and many more, all had to turn away late-comer supplicants for rooms literally by the hundred. The latter is particularly popular with the motoring fraternity, and mine host thereof, Mr. H. J. Preston, began refusing would-be Christmas patrons before the end of November, and during Christmas Day itself he booked several parties for the Yuletide of 1909?

THE historic Old Ship is the local headquarters of the A.A., and so 'twas only natural that Colonel Bosworth, in Brighton for

in the exhilarating conditions so many motoring parties were out to enjoy.

ALL types, makes, sizes, and powers in the car world were represented, it being, however, impossible to draw reliable distinctions and deductions from such a restless scurrying to and fro of traffic. Among more or less well-known visitors driving Daimlers were Mr. Peters, Mr. Woollard, Mr. Blofeld, Mr. Sam Mayo, of music-hall fame, Mr. Littleton, Mr. Wagg, and Mr. E. Robb. Lady Clarke Jervoise was in a White steamer. Mr. J. W. Benson—who supplies a goodly portion of the world with its domestic apparatus—had a handsome Renault, while his brother, Mr. F. J. Benson, favoured a Fiat. Mr. M. A. Copchili was another Renault owner, Mr. Martin Scott seemed to be having an excellent time of it in a Siddeley, and a Tony-Huber car of Mr. King Smith's added an unfamiliar name to realms of car-nomenclature, with whose expansion it becomes difficult to keep pace.

MR. JEFFREYS and Mr. Pearce had Napiers; Mr. Carlisle

Sir Bache Cunard at the wheel of his Sheffield-Simplex six-cylinder Car at Nevill Holt, Market Harborough.

Christmas, should spend it there. No doubt he found plenty of congenial companionship in the society of many other ardent devotees of the sport with which his name is so prominently identified, amongst them being Mr. Harry Taylor, Mr. L. Barrow, and Mr. and Mrs. A. E. Cohen, of London, Mr. R. Jeffries, who had motored from Manchester, Mr. and Mrs. Bishop, Mr. Roberts, Mr. T. Christie, of Chelmsford, and Mr. R. E. Casares, who came from London, where he is staying at present, but really hails from far-distant Buenos Ayres.

THE Front on Christmas morning—more especially towards the luncheon hour, when everyone came whirling back with appetites sharpened by excursions in the keen bracing air and radiant sunshine of a brilliant winter's day—made a wonderful panorama, emphasizing to a locally unprecedented extent the all-dominating sway of King Petrol's influence on modern methods of locomotion. If only the numberless motor-brougham the eager crowds on the Front had watched for and seen every day during the fortnight before Christmas week had still been there, mingling with the vehicular kaleidoscope, it would have been a royal Christmas indeed, and no one more than King Edward would have revelled

drove an Ariel; Mr. Ritchie, Mr. Hines, and Mr. Doherty were of the Darracq section; and Mr. Ramsden and Mr. Skipper of the Decauville ditto. Other motorists holidaying it at Brighton included Mr. Mackenzie Fairfax and Mr. Coward (Panhards), Major Castrell (Humber), Mr. Ansell (Argyll), Mr. Rendle (Gladiator), Mr. W. F. Clarke (Humber), Mr. Crisp (Thornycroft) and Mr. Wright (Leon Bollee). It is worth adding that, as far as we could ascertain, the Sussex police allowed everyone to pass their Christmas in peace!

SAXONIAN.

A SERIES of speed trials over a distance of 10 kilometres was recently held near Buenos Ayres, Argentine Republic, when the best time of the day—5 min. 55 sec.—was made by M. H. Van der Heyden on a 30-h.p. Spyker. In the 15-h.p. section victory went to Baron de Marchi's 15-h.p. six-cylinder Delaunay-Belleville (6 min. 7 sec.), in the four-cylinder (up to 90 mm. bore) class to M. Genonceaux's 12-h.p. car (6 min. 54 sec.), in the two-cylinder category to M. Nigri's Peugeot (8 min. 13 sec.), while the single-cylinder class was won by a Sizaire-Naudin in 6 min. 56 sec.

The Paris Industrial Motor Vehicle and Aeronautical Exhibition.

[BY OUR SPECIAL REPRESENTATIVE.]

THE second part of the eleventh Paris Salon, devoted to industrial automobiles and motor-boats, also includes the first aeronautical exhibition, the interest in which, as anticipated, by the organisers of the show, surpasses that shown in the other portions of the display. The industrial cars in general have not departed from the standard set by the last two exhibitions, while the taxicab designs were so well represented in the first part of the show that very few are to be seen in the second. Small private and hotel omnibuses are well to the fore, but the heavy city omnibus is not being pushed by the various makers. It is probably recognised that the local conditions attending the service of

aeroplanes of Wright, Farman, Delagrangé, Bleriot, Esnault-Pelterie, Santos Dumont, and the pioneer of aerial flight, the "Avion" of Ader. This contrivance dates from 1893, and was experimented with up to 1897 under the eye of the French military authorities who advanced some £20,000 towards the expenses of the experiments. It is stated that the latter cost in all some £60,000, the balance being paid by the inventor, Ader, who is still alive. This bat-like flying machine is fitted with a flash boiler, 40-h.p. steam engine, two four-bladed fans, and is exceedingly light in weight.

The stand of the R.E.P. firm presents great interest. In

General View of the Industrial Motor Vehicle and Aeronautical Exhibition at the Grand Palais, Paris.

On the left of the picture will be seen the "Ader" Aeroplane, built about fifteen years ago, and lent by the Authorities of the Museum of the Arts and Metiers, while in the centre is the large airship "Ville de Bordeaux."

omnibuses merit special study, which cannot be exemplified to any extent in a few chassis displayed in an annual show, and in a general way the purchasers of omnibuses or industrial automobiles are not likely to be greatly influenced in their choice by the inspection of a car at the exhibition.

It is in the light motor section that all the public interest is centred, and it is very evident that quite a considerable amount of work has already been done in this line, and more than one would expect in the course of the short space of a year. The fact is that there were numbers of light motors almost ready a year ago, but they were not sufficiently advanced to be exhibited. This accounts for the splendid display at the present show.

Strung up in the vast building of the Grand Palais is one of the series of five war airships, the "Ville de Bordeaux," identical in appearance with the "Ville de Paris" and the "Clement-Bayard." The motor installation has been handled throughout by Renault Frères, who have put in an 80-h.p. engine. Further back is arranged a stand of honour, on which are to be found the

addition to the actual aeroplane with which Esnault Pelterie has accomplished some flights at Buc, near Versailles, there are several light motors of his distinctive design on view. At the time the inventor was developing the aeroplane he was unable to find a suitable motor for the work, hence the design of the engine, which attracted so much attention at the last Salon. The cylinders are all arranged fan like, the shaft being at the apex. There are several seven-cylinder and ten-cylinder motors on view, which have some of them been sold to the present-day notabilities in the line of aerial flight.

The aeroplane of Wilbur Wright is not the one which he has used for flying, but a duplicate made at Dunkirk. The light motor, however, is the one actually used for some time by the daring "flyer." A comparison of the motor with others advanced for aeroplane work does much to answer the enigma of his success. Wright has stated that he can fly with any good motor taken from a car without requiring a specially light engine. This remark shows where the problem of flight really is. What is wanted is

not so much the aeroplane, since it seems admitted that there are several forms which will fly with suitable propelling power, but a light motor which will give a better and more regular service than the engine installed in the best of motor-cars. And this is where the motors have failed to come up to expectation. The service required is hard, comparable only to that in a motor-boat, the constant drag of the propeller being equivalent to the demand of maximum power to be maintained uninterruptedly. Here the comparison between boat and aeroplane ends, since in the former the weight need not be cut to any extent, whereas the aeroplane requires the lightest of construction to give the maximum efficiency. A perfect regularity is what is required of the light engine, in addition to maximum continuous output, and if the

The President, M. Fallières, and his suite, inspecting the airships and aeroplanes at the Salon.
From a Caricature Sketch] [in "L'Auto."

aeroplane has come to stay, this is what the motor constructor must produce in order to obtain that hold on the market which he will richly deserve.

The Antoinette motors are just as much to the fore as ever. The firm show an extremely simple 16-cylinder, water-cooled group, with aluminium crank case and aluminium tube cooler. Another 8-cylinder group of 50-h.p. is fitted with a new type of cooler. The latter forms the strakes of a canoe-like wooden frame, there being 45 tubes on each side of the frame, with a collector at the apex. Each tube is 4 metres in length, and the 90 tubes, with junctions and wooden frame, weigh less than 30 pounds. The Antoinette motors were the first of a series now made which can produce, in running order, one brake horse-power for less than 5 lbs. weight. This has been achieved in the majority of cases in the motors shown by the suppression of the heavy fly-wheel and counterbalancing weights and more especially by the adoption of multi-cylinder models, in which the crank shaft has fewer throws than the number of cylinders, two or more connecting rods being fixed to the same throw. In fact, multi-cylinder models are a *sine qua non* in the light weight motors. Some makers, notably the E.N.V., Pipe and Renault, and also the Fiat, retain certain features common to the usual four-cylinder car engine. The number of cylinders has been increased and arranged in the form of a V., with one cam shaft on the inner side of the apex. The crank shaft and cam shaft in this arrangement are of course not much heavier than that in a four-cylinder model, while with the adoption of a large number of cylinders the fly wheel may be dispensed with. One or two makers still retain a fly-wheel of the bicycle spoke type, with a comparatively light rim, this being held to be as efficient as a smaller but heavier wheel.

Another detail is the difference of opinion regarding water and air cooling. All would like to have their engines cooled by air, but some makers are evidently doubtful as to whether this can be done with the continuous maximum output demanded of the group. Air cooling has its partisans in Pipe, Fiat, Renault, Farcot, and others, whilst the Bayard-Clement, R.E.P., Gobron, and Antoinette motors are water cooled. There are one or two rotating air-cooled motors shown, which contain laudable efforts to overcome the difficulty of cooling.

The Fiat light motor, which is just out of the factory of the Turin firm, has eight separately-cast air-cooled cylinders surrounded by a sheet-iron cover, through which air is driven from a fan on the main shaft of the engine. One carburettor is set between the cylinders, which are arranged in the form of a V, and the cam shaft, which is geared to the main shaft, also, engages by means of a double reduction the two high-tension magnetos, one for each set of four cylinders.

Pipe is again showing an interesting eight-cylinder engine also with cylinders arranged in V shape. The bore and stroke are

both 100 mm., and at 1,500 revolutions per minute the engine is stated to give 70-h.p. The weight is 285 pounds. The crank case is of aluminium; the crank shaft is in one piece, and each of the four throws has two connecting rods attached to it. The casing of the engine is of aluminium, with an aspirator at one end; the air inlet is made at the bell-shape base of this casing. A single camshaft operated mechanism is fitted over the tops of the cylinders, the valves being inside the heads. Inlet and exhaust valve are combined in one valve for each cylinder, this being arranged according to the compression of a double concentric valve. There are, however, two cams and separate mechanism for inlet and exhaust. A single magneto is carried at the rear end of the engine. An ordinary carburettor is lodged in the inside of the apex of the V formed by the lines of cylinders.

The designer of the Clement factory, M. Clerget, has brought out a seven-cylinder water-cooled motor, which has its axis arranged vertically, with a circular crank case and horizontally arranged cylinders. Cooling is provided for around the cylinders by means of copper jackets. The walls of the cylinders are $2\frac{1}{2}$ mm. in thickness and the bore and stroke are 3.9 in. and 4.4 in. respectively. A high compression of 10 lbs. per square centimetre is adopted and the speed of the engine is 1,400 revolutions per min. The head of the cylinder is separately brazed on to the body, and is dome shaped, and overhead mechanism opens and operates both inlet and exhaust with one tappet, the valve chamber forming one piece with the cylinder head. The crank shaft has a single throw and the connecting rod and secondary rods are quite neatly arranged on the single pin; balance weights are used inside the crankcase to obtain evenness of running, since the flywheel has been dispensed with. The Clement Bayard people evidently believe that the increased weight attaching to the cooling arrangement is more than

The R.E.P. (Esnault-Pelterie) seven-cylinder Motor for Aeronautical Purposes.

The engine is rated at 30-35-h.p. and weighs 194 lbs. A 20-25-h.p. five-cylinder motor, weighing 115 lbs. and one of 40-50-h.p. with ten cylinders, turning the scale at 216 lbs., are also made.

counterbalanced by the efficiency of the engine. The centrifugal pump is arranged in the base of the crank case and has a separate duct for each of the seven cylinders. A single cam with eight bosses run with a gear reduction of eight to one and operates all the valves. The same casing contains the gearing for the magneto, the latter mechanism being fitted at the top of the crank case. The carburettor is of very light weight, about a pound, and is made of aluminium. A splash lubrication method of lubrication is employed. The oil is led to the main bearings and drops into the crankcase, where the cylinders take it up. No pump has been found necessary. Any excess of oil which may find its way into the cylinder head is expelled from the

exhaust port, which is situated at the lowest part of the horizontal cylinder. The shaft extension carries a bevel gear on the top of the engine for connecting to the propeller shaft, which, of course, may be geared to the extent desired.

The Renault light motor was produced a year ago and has since been through some changes. Two ventilating fans were formerly employed to force and to aspirate the air through the sheet iron casing surrounding the cylinders. One fan has been retained, which throws the air on to the cylinder heads and then it is deflected on to the exhaust box beneath the crankcase. The propeller shaft is really an extension of the cam shaft, this being an ingenious manner of reducing the speed of the propeller without extra gearing, since with the engine shaft running at 1,200 rev. per min. the propeller shaft is normally running at half this speed. The engine is rated at 50-h.p., but is stated to give 15 per cent. more at 1,800 rev. per min. The cylinders are 90 by 120 mm. bore and stroke.

A somewhat novel motor is that presented by Laurent Seguin; this is a rotating engine, of which there were one or two examples at this year's show. The S.C.A.R. is again shown in an industrial car this year, and the Gnome seven-cylinder is another of the same type. The Seguin motor has a hollow crank shaft with an aluminium crank case, carrying seven cylinders, all connected to the single crank of the shaft. The base of the cylinder passes through the crank chamber and is locked to the latter by means of a split ring in a groove on the cylinder body. The cylinders are all bored out from solid steel, and the radiating fins of the cylinders are also an integral part of the metal forming the cylinder. This would appear to be a difficult piece of work. The inlet valve is in the piston head and is of course automatic. The mixture passes through the inside of the hollow shaft. The latter also encloses a pipe which carries oil to the centre of the crank chamber, from where it is distributed to the rotating cylinders by centrifugal force. The engine, which is entirely constructed of nickel steel, has seven cylinders of a bore and stroke of 110 by 120 mm., being rated at 50-h.p. at 1,200 revolutions per minute. The weight of the engine with magneto, carburettor and lubricator is about 166 lbs.

The new Gobron light weight motor is well worth a study, in view of the very ingenious application which is made of the Gobron type of piston arrangement. As is well known, the explosion takes place between two pistons in each cylinder, the uppermost piston

The B.E.P. (Esnault-Pelterie) Aeroplane.

being connected to the crank shaft by connecting rods on the outside of the cylinder proper. The lower cylinder is connected to the crank shaft in the usual manner. In the model on view the eight cylinders are arranged in the form of a cross, two being arranged on each of the four arms. The motor really forms two twin motors, since the idea has been carried out of making each group of four cylinders independent by means of two magnetos, so that in case of a breakdown of one set the motor could work on at a sufficient speed to allow the aeroplane to descend. The cylinders are water-cooled, and separately cast with copper jackets,

the bore and stroke being 90 by 160 mm. The main piston or that directly connected to the crank shaft has a slightly longer stroke than the upward travelling piston. At 1,200 revs. per min. the lineal speed is stated to be about 20 ft. per second, and the output is given at 80-h.p.

Some idea of the importance of the Aero section is gathered from the fact that altogether there are no less than sixteen full-sized aeroplanes on view, representing the most successful types of machines yet constructed. In addition there is a very large number of models of flying machines comprising almost every con-

The Antoinette Aeroplane on which M. Welfringer last week made a flight of one kilometre at Issy-les-Moulineaux.

ceivable design calculated, in the opinion of the inventors, to give maximum of stability, speed, and load carrying capacity.

Altogether the 1909 Salon presents a very creditable lot of light motors, and a fair choice can be made amongst the dozen first-class makes represented. The number of light motors on view is a proof of the genuine interest being taken in the subject by the leading French motor engineers, and it is certain that before long there will be on the market several types of motors capable of giving that continuous maximum output which is so desired by members of the aerial fraternity before they can proceed beyond the experimental stage of the art of flying. Just now, however, it seems to be more a question of men to fly than machines to enable them to fly. It is sure that the aeroplane will support the motors if the latter will work continuously. There are, however, but half a dozen men in this line who can be said to have really done anything laudable in the air, and if the men can be found, the motors will certainly soon be developed for the demand arising. The French Aerial League, which has a stand in the Grand Palais, shows that there are prizes to the value of over eight thousand pounds awaiting successful flyers, and these prizes do not include the well-known Prix Michelin or any others which have been made known directly to the public independently of the Aerial League.

On February 1st Mr. C. J. Glidden will resume his travels by automobile, his route including Algeria, Tunis, Tripoli, the Sahara Desert, and Sicily. At the present time he has 46,528 miles to his credit, to reach which total thirty-nine countries have been visited.

The Marquis of Tullibardine has been holding a series of political meetings in West Perthshire, utilising his motor-car in getting from place to place. One evening his car broke down between Strathloch and Killiecrankie, but fortunately he was able to obtain another one from Pitlochry to continue his campaign.

The new individual associates just elected by the R.A.C. General Committee include Mr. W. E. B. Priestley, M.P., whose recent letter to the *M.U.J.* attracted some attention at the time of its publication, Sir R. P. Beauchamp, Bart., Mr. Mortimer Menpes, the eminent artist, and several ladies, including Lady E. A. Gordon, Lady Rose Lyon and Miss Edith Joseph.

GOSSIP FROM PARIS.

The A.C.F. Grand Prix Race.

Though at the time of writing the short delay of eighteen days allowed by the French Automobile Club for the inscription of cars has not yet expired, it is not rash to predict that there will be no Grand Prix in 1909. In spite of all the efforts of the partisans of the race, with the Marquis de Dion at their head, up to last Saturday night only nine cars, one Guillemin (Le Gui), three Cottin-Desgouttes, three Mors and two Rolland-Pilains had been entered; thirty-one inscriptions were still wanting to make up the number of forty entries required as the minimum for the maintenance of the race. The Marquis de Dion had, it is true, announced his intention to enter three cars, and one or two other French firms were expected to follow his example. As for the foreign automobile makers, the Sporting Committee of the A.C.F. had heard that three Italian firms and perhaps a couple of German manufacturers would enter cars. No news had been received concerning the intentions of British builders of motor-cars. It was therefore foreseen that thirty entries was the most that could be expected. However, if the great French International competition which was created to supplant the Gordon Bennett Cup is suppressed, there are plenty of other automobile races for those who find pleasure in witnessing cars travelling at high speed. The majority of the provincial and foreign automobile clubs have already sent to the A.C.F. for inscription in

Messrs. Wilbur Wright and Henry Farman, the Heroes of the Flying World.
From Cartoons Sketches by Mich. [in L'Auto.]

the racing calendar the denomination and exact date of the competitions they propose to hold in 1909. There are already more than sixty, and it is pretty sure the number will be increased before the publication of the calendar towards the end of January.

The Aeroplane Exhibition.

This year the "Salon des poids lourds" deserves to be named the "Salon des poids légers." It is not because there are not plenty of heavy self-propelled vehicles, omnibuses, delivery vans, &c., on show, but because the general public goes to see the balloons and aeroplanes, and pays but little attention even to the motor-boats and yachts, of which, however, there are a goodly show. When I visited the exhibition on the opening day with a friend who is greatly interested in machinery in general, and more especially in the new light motors, I was struck with his remark as he glanced at the spherical balloons at each end of the nave, the steerable balloon occupying the centre of the building, and the aeroplanes of all descriptions filling the transept. Pointing to the crowd contemplating with wonder the mysterious looking apparatuses, he exclaimed, "Yes! There is enough there to set the brains of the people working." Most surely he was right. There was Santos Dumont's "Butterfly," with which the Brazilian tried to win the Deutsch-Archdeacon prize, Wilbur Wright's marvellous machine, with which the now celebrated American astonished the whole world, Delagrangé's aeroplane with which the Frenchman flew at Rome in the presence of the King and Queen, the monoplane on which Bleriot experienced so many mishaps before he recently succeeded in flying across country for a matter of some twelve miles, Esnault-Pelterie's elegant machine which carried him so high into the air against his will

that he for a few weeks held the unofficial record of height attained on a machine heavier than the air; Henry Farman's bi-plane, with which the English aviator led the way by flying a kilometre out and home again, and by quite recently making the first trip from town to town, and numerous other flying machines with which their inventors expect to gain fortune and renown. The exploits achieved are recorded on placards at the foot of the various machines and constitute the history of the first victories in the campaign for the conquest of the ethereal realm. They are calculated to inspire emulation and unbounded confidence in ultimate victory, but the world must not imagine that the battle is already over. There remains much to be done. Yes, even more than has yet been accomplished, before the ordinary mortal can enjoy the sublime pleasure of travelling in safety through the air high over the fields and forests and over mountains and the highest monuments of towns and cities.

Motor-Buses in Paris.

The Municipal Council of Paris is in a quandary. The concession of the Omnibus Company will expire in May, 1910, and it must either be renewed without much further delay or the new concession must be given to one of the numerous other companies which have tendered for it. But the unfortunate Municipal Councillors do not know exactly what they want, or more correctly speaking, they know that the Parisians, while demanding the generalisation of the motor-bus, would strongly object to the multiplication of the type of vehicle introduced by the old company. If these vehicles were to be taken as a specimen of what the Omnibus Company would give the Parisians if its concession were to be renewed there would be almost another revolution! It is quite understood that from 1910 the horse-drawn omnibuses are to be done away with, but no one knows what type of vehicle is to be adopted in their place. With the object of settling that question the technical advisers of the city authorities last week brought a certain number of new types of motor-buses to the Place de l'Hotel de Ville for examination. Some of them were regarded as too light and others as too heavy. It is useless to describe them as no selection was made, but several were provided with the new twin or triple pneumatic tyres which, if adopted, would meet many of the objections raised against the Paris motor-buses now in use.

The Champion Flyer of 1908.

Writing on Boxing Day I learn that Wilbur Wright intends to fly over the Auvours military manœuvring ground all day long—that is to say for at least five hours, before the end of December. He wishes to do so to make certain that neither Henry Farman nor Delagrangé will at the last moment rob him of his world's record flight of close on 100 kilometres, and to secure the prize of £800. Should the American aviator fail to accomplish that feat everyone knows that it will be due to nothing but his motor or to the intensely cold weather. Not only Wilbur Wright but Henry Farman and Delagrangé can fly an indefinite distance, and during the length of time their motors will hold out without a *panne*, and, indeed, so long as their petrol tank is not exhausted. That has been demonstrated over and over again. For 1908 Wilbur Wright will in all probability carry off the Michelin prize, and he will unquestionably have well deserved it. Since he commenced his demonstrations at Le Mans he has led the way, showing the French aviators what to do and how to do it. There is very little chance of Henry Farman being able to compete successfully with him at the present moment, for the good reason that he has put the new Renault air-cooled motor on his machine, and has not yet had time either to put it into good working order or to practice with it. It seems, therefore, extremely probable that Wilbur Wright will be proclaimed the Air King, the Champion Flyer of 1908!

MARNEY.

In connection with the Industrial Vehicle and Aeronautical exhibition in Paris this week, a number of papers have been read, among them being one by M. Kapferer, on dirigible balloons, one by M. Voisin, on Aeroplanes, one on Aerostation and Aviation by Commandant Renard, and one by M. Lumet on the Exhibits in the Marine Section.

A Siamese Motor Carnival.

The King of Siam (in the centre of the picture) at the opening of the new Birthday Bridge, Bangkok—His Majesty's decorated car can be seen in the background.

THE anniversaries of the coronation of His Majesty King Prabach Somdetch Phra Paramindra Maha Chulalongkorn Phra Chula Chom Klao, of Siam, are always celebrated with considerable *clat* in the Siamese capital, but this year Bangkok has been more than usually *en fete* on account of the king's reign having exceeded that of any of his august ancestors. The people of Siam, not alone the natives but also the members of other nationalities residing in the land, subscribed to celebrate His Majesty's forty-first coronation anniversary by presenting him with a bronze equestrian statue of himself, which was placed in the big boulevard near the new royal palace and unveiled by the king with great ceremony on November 11th. The celebrations, however, lasted for three days, and included a big meet and review of gaily-decorated motor-cars, a review of some 20,000 troops, a long procession of the various Government Departments, &c., and there were magnificent fireworks and illuminations.

The Europeans subscribed some £2,900 to the statue, which is quite an artistic production in bronze on a Carrara marble base. The Siamese excel in temporary decorations and illuminations and their fireworks are both elaborate and pretty.

His Majesty each year celebrates his birthday by presenting one or more bridges to the town, and this year gave a very fine one. There was a big garden party held at the new palace grounds, at which practically everyone of social standing was present, as all who subscribed to the statue received invitations, and several royal dinner parties were also held.

Of course everyone culled out a holiday for the occasion, and the place was in a state of high carnival. The Royal Palace was the centre where the public got their *panem et circences*, the scenes being extraordinarily picturesque on account of the brilliant colours worn by nearly everybody, and the gaudy uniforms. The various Rajahs and Sultans of the little Siamese Suzerain States in the Malay Peninsula and the various Shan and Laos chieftains made quite an imposing appearance, as they were for the most part much bejewelled and kaleidoscopically clad. There were some 130 motor-cars in the big procession which escorted the King to the opening of the new bridge, and they certainly made a brave show.

Quite an elaborate set of rules had been laid down for the guidance of the motorists, who were told *inter alia* that "the appropriate space between cars when on the march can be gauged by observing the dust raised by the car in front," and they were instructed not to raise more dust than they could help when passing the King. The cars were ranged in three divisions according to power, and this no doubt did much to obviate possible accidents. Of these there were happily none worth chronicling. In addition to the festivities several other events transpired of more or less importance to the country at large. A new 67 kilometre section of the State railway line which runs north to the Burman frontier was opened, and the new gold coinage was issued from the Treasury for the first time. As seems to be usual on such occasions nowadays, a special set of postage stamps was also issued. The presentation of the statue to the King, it may be mentioned, was made by His Royal Highness the Crown Prince of Siam in the presence of an enormous gathering.

EVIDENCE of the growing importance of the motor movement in India is seen in the receipt from Messrs. Oakes and Co., Ltd., of the Motor Garage, Madras, of a catalogue of motor-cars, cycles, launches, accessories, &c., which extends to about 150 pages, on each of which a number of illustrations are given. The first portion of the list deals with the numerous cars for which the firm are agents, following which are no less than 108 pages dealing with motor accessories. Messrs. Oakes have endeavoured to make the catalogue not merely a price list, but a book of reference to car owners in India, and with this object the work includes hints on the care and management of cars, hints and tips on the Causes and Treatment of Misfiring, the R.A.C.'s table for rating the horse-power of motors, and metric and English tables; notes on the charging and care of accumulators, diagrams of wiring system of one, two, and four cylinder engines with trembler and non-trembler coils, and simple instruction for adjusting trembler coils, besides a great quantity of other useful hints to car and cycle owners.

CONTINENTAL NOTES.

The Improvement of the Roads.

Baron Merlin, the president of the Roads Committee of l'Automobile Club de l'Oise, considers that roads should be divided into two classes: Roads of general interest and roads of local importance. The first should be carried straight to their end without regard to the demands of individual neighbourhoods. With the second bring all local interests to the front. Roads of general interest should be open to all sorts of locomotion; pedestrians, cyclists, and light carriages or heavy vehicles for hauling, whether moved by mechanical or animal power. They should be laid for all kinds of locomotion, and in such a way as to establish the responsibility of individuals on every part of the road. In order

the same space as in Vienna. The Ringstrasse is the broadest and most beautiful street in the world, and along it are nearly all the monumental buildings in the city. Vienna roads are beautifully macadamised, and offer every attraction to the motorist, in fact, we found the Austrian roads to be of a very high degree of excellence, their only drawback being the fact that in the spring they are sprinkled with fine stones, whose edges are somewhat detrimental to tyres. But when these are worn down they are the making of the roadway.

"Some of the trips which we regularly made from Vienna were to Schönbrunn, Leising, Baden and Carlsbad. While Austria is a most interesting country in which to spend a holiday, Hungary is even more so, because of the mediæval atmosphere which still exists. The peasantry in many sections retain the old

Motor Vehicles in the recent Austro-Hungarian Military Manœuvres.
 (1) The open-air Garage at Warasdin. (2) Reserve machines at Pacsa. (3) A road-train near Alsó-Lendva. (4) Another of the road-trains. (5) A steam road-train near Belovar. (6) The travelling motor repair shop near Warasdin. [Allgemeine Automobil Zeitung.]

to meet these several conditions the roads should be wide, with a sensibly horizontal running surface. Grades should not be too much reduced, to the detriment of the straight line. The limit of grades should be 1 in 20, and the minimum limit of curves 50 metres.

Austria and Hungary for Motor Tourists.

A Canadian motorist, who has recently returned from a lengthy stay in Austria and Hungary, writes enthusiastically of these countries from a motoring point of view:—"Vienna is," he remarks, one of the most charming cities in the world, being noted for the vivacity and good nature of its inhabitants; moreover, it is rare to find in any great city so many fine structures contained in

picturesqueness of their garb, while imposing castles crown many of the mountain heights. The enjoyment is lessened to some extent by the fact that the roads are often very bad, and that spare parts also present a great problem, they being hard to procure, and often do not fit."

French Motor-car Exports.

The French export trade in motor-cars and parts continues in a very depressed condition. The shipments during the eleven months ending with November last, according to the returns now available, only amounted to £4,783,480, as compared with £5,366,040 in the corresponding period of 1907, a decline of £582,560.

Reliability Trials in Sweden.

The Royal Swedish Automobile Club, of Stockholm, is organising an automobile reliability trial "to develop capable and careful drivers and to create motor-car types suitable for Sweden in every season, and to increase the interest for motoring, especially in winter." The event, which will be held in February, from Stockholm to Gothenburg, a distance of 500 kilometres, will follow very much the lines of the early reliability trials in this country, stops being penalised at the rate of one mile a minute, &c. Repairs to tyres will involve a penalty at the rate of one-fifth of a mark per minute, and putting on or taking off non-skids will be treated in the same way. There are to be two classes, one open to cars driven by members of recognised automobile clubs, and the other for cars costing not more than 6,000 kronen. In the first the prize will be the Winter Cup, valued at 2,500 kronen, while the Gothenburg Cup, valued at 1,500 kronen, will be the chief award in the other class, which is intended for strong small cars. Entries, accompanied by a fee of 100 kronen, should be sent in at once.

The Nice Automobile Week.

The programme of the automobile fêtes which are to be held at Nice in March next has been provisionally drawn up. On the 17th there will be a motor paper-chase, on the 20th an automobile excursion, on the 24th an elegance competition at Monte Carlo, on the 25th a series of speed trials over the flying kilometre, and on the 28th a hill-climbing competition on La Turbie.

Aeronautical News.

It is proposed to establish professorships of aviation at the Göttingen University and at several technical colleges in Berlin.—The sum of £12,000 is being included in the next Spanish Budget for the purpose of acquiring a number of flying machines.—The Aero Club Liège-Spa, has just been formed at Liège, Belgium.—Some trials are about to be made with a new aeroplane of the monoplane type fitted with a 50-h.p. engine, built by Messrs. Raoul and Vendome.—It is announced that Wilbur Wright will remove to a new trial ground at Pau early in the new year.—M. Delagrè is now practising with a new aeroplane fitted with a 60-h.p. Chenu engine, in anticipation of the competition at Monaco.—The latest society in connection with the French aeronautical world is the Union Française Aérienne, which has just been formed in Paris.—A somewhat novel prize is being offered by M. Lortet; it takes the form of an ingot of solid gold weighing one kilogramme and worth approximately £136, and will be presented to the first aviator who flies from the centre of the town of Tarbes, France, to a point ten kilometres away.—In the presence of a small company of official personages, on Saturday last, Wilbur Wright made a short flight lasting about ten minutes, during the course of which he performed a series of daring manœuvres. Owing to the intense cold Wright did not attempt any ambitious flights, but the skilful exhibitions of steering which he gave during the short time he was in the air moved the spectators to enthusiasm.

Belgian Motor-car Imports and Exports.

The value of the foreign motor-cars and parts imported into Belgium during the eleven months ending with November last amounted to only £127,248, as compared with £153,652 in the corresponding period of last year. On the other hand, there has been an increase in the exports of Belgian motor-cars and parts—from £397,792 in the first eleven months of 1907 to £422,152 in the similar period of the current year.

Les Autos Militaires en Allemagne.

Le ministre de la guerre d'Allemagne vient de recommander aux chefs de corps de contribuer à l'initiation de tous les officiers à la conduite et à l'entretien des automobiles. Ils devront également aviser à pourvoir chaque régiment d'au moins dix mécaniciens-conducteurs d'automobiles, rompus dans le maniement et aux soins à donner à ces véhicules. Le ministre insiste aussi sur l'utilité qu'il y a à pratiquer les sports aériens, les dirigeables et les aéroplanes de préférence aux ballons libres.

SOME USEFUL NOTES.

A FREQUENT cause of leaks in radiators is said to be that the vents in the filling caps become choked with sediment or dust, with the consequence that steam accumulates in the radiator, and the pressure, seeking an outlet, forces an opening at the weakest point. A little attention to the vent will remove the cause of the trouble, while a mixture of red lead, white lead, and gold size will be found an excellent means of stopping any leaks of the kind.

BEWARE of putting resin and other concoctions on the leather of a cone clutch; the cure by such agents as resin is only temporary and very detrimental to the leather, and resin, it should be noted, has the unfortunate property of becoming heated by the friction, and consequently sticking up the clutch, so that sometimes it cannot be withdrawn when required.

WHEN a motorist has become somewhat expert in the running of his car it will be found advantageous to gradually cut down the petrol feed until the point is found at which the motor runs well, but will not stand a further reduction. The smaller the proportion of petrol the more economically the motor will run and the cleaner it will keep. This can, of course, be carried to extremes and the efficiency of the engine interfered

Motoring on the Ice in Sweden.

with; but the proper feed can be determined without great difficulty. The same process should be applied also to the cylinder lubrication. When the petrol and lubricating oil are feeding into the cylinder in the smallest quantities that will produce good results, the motor should run for a long time without fouling the compression space or the sparking plugs, and on the minimum amount of oil.

WHEN motor lamps have been subjected to the weather, or have been in storage for a time, without being cleaned, ordinary cleaning polish or paste may not remove the coating of verdigris which forms. Even the application of considerable "elbow grease" helps matters but little, but the following mixture will remove the verdigris, and if it will not thoroughly restore the lamps to their original brightness, at least will prepare a surface which can be highly polished by the use of the ordinary article. Mix a good metal polish with wood alcohol, and apply the resulting mixture to the brass portions of the headlight, allowing it to dry. In a short time rub with the regular woollen cloth; the verdigris and stains should then come away, leaving a fine surface.

A MATTER which should be guarded against in the operation of combination contact makers and synchronised high tension distributors is the prevention of any collection of carbon or metal dust in the high tension compartment. If this accumulates uncertainty ignition is likely to result.

HOW TO USE ACETYLENE GENERATORS SUCCESSFULLY.

THE usual experience of motorists with acetylene generators is almost too familiar to need mention. When the generator is brand new it works fairly well, although quite possibly it develops a trick of causing the lamps to flare and burn dim alternately, to the endangering of the lens mirrors in the one case and the jeopardy of the owner's neck in the other. In the course of a few weeks, or even of a few cold evenings, the owner notes a gradual failure to obtain good flames. The pressure at the generator appears to be normal, so far as the water supply and other indications show, but nevertheless the lamps burn dimmer and dimmer. Presently the lamps flicker themselves out. "Water in the pipes" is said to be the cause, and the pipes are blown out with a tyre pump, or with compressed air. Water comes out, sure enough, and for a few nights the lights burn almost as well as ever. Then the trouble begins again, and repeated blowing-out of the pipes does little to remedy it. Some feet of rubber tubing, temporarily substituted for the piping, works well for a few hours, but soon the old flickering reasserts itself.

By this time the owner, unless he understands the nature of his trouble or is sufficiently interested to find out, is probably in a frame of mind to pronounce anathema on the whole tribe of generators.

After all, the way of obtaining a steady and reliable supply

of lamps it feeds—of course, up to the point where the heat of generation becomes excessive. Such a generator, provided with two separate outlets, is very convenient when it is desired to supply both the side lamps and headlight from the same source, and to use the latter only on occasion. Again, some generators continue to work for a considerable time after the gas or the water feed has been shut off. This is owing to imperfect separation of the lime from the carbide. The lime receives part of the water which should go direct to the carbide, and until the moisture in the lime has been absorbed by the carbide generation will continue. A generator in which the carbide is kept clean will stop generating very soon after the water drip is cut off. Such a generator, if large enough to carry a good supply of carbide, can be used much like a gas cylinder, the gas being turned on and off repeatedly as required.

2. THE PIPING.—The small copper tubing ordinarily used to connect the lamps and generator is destitute of every merit except convenience in installing. It is too soft to keep its shape, and so small that, when it acquires the inevitable serpentine form seen on every car more than a few months old, the slightest depression acts as a pocket to receive condensed moisture. It is this condensed water which causes the acute flickering so often seen. In addition, the small pipe clogs rather quickly, especially at the ends, and if not properly supported it becomes brittle and cracks from vibration. The proper connection from a generator to the side lamps is a brass pipe of $\frac{1}{2}$ in. pipe size, or about $\frac{1}{4}$ in. inside

Diagram of Piping System from Generator to Lamps.

of gas from an acetylene generator is simply a question of enlightened common sense and a little intelligent study of the unalterable properties of carbide, lime and water. This article is not written, remarks Mr. H. L. Towle in the New York "Motor," for people whose common sense is a quality too precious for common use—such people, for example, as do not take the trouble to keep their lens mirrors clean, or to clean the burner tips when the two little tongues of flame shoot sideways past each other owing to particles of soot in the burner orifices. It is assumed here that the reader is as much interested in extracting pleasure from his night motoring as he is, for example, in keeping the tyres sufficiently inflated or the engine fed with oil.

To get a steady gas supply from a generator four principal things are needed:—(1) A good generator; (2) Large piping; (3) Provision to drain condensed moisture in the gas; (4) Provision for occasionally blowing out and cleaning both the piping and the generator outlet.

Each one of these requirements is simplicity itself. Let us consider them in order:—

1. THE GENERATOR.—Any generator will make gas after a fashion, and if it is not too small it will make gas as fast as needed. There is, however, a great difference in the ability of different generators to govern their gas production automatically, which can only be done by having the water feed controlled directly by changes in the gas pressure. A strictly automatic generator will feed either one or several lamps with equal ease, and will maintain the same pressure regardless of the number of

diameter. A similar pipe, or rubber-fabric hose of the same size, should be used to supply the head light. Cheap rubber tubing is very unreliable.

3. DRAINAGE.—It is of the very first importance that the connection from the generator should slope directly downward to the lowest point in the pipe line, and that at this point there should be either a drip outlet, which may be opened at will, or a pocket sufficiently large to hold at least a teaspoonful of water. The reason for this is that the water in the gas is mostly condensed close to the generator, and if the pipe runs upward from the latter, some of the water will run back into the generator, causing clogging and corrosion of the gas valves. From the lowest point the pipe should rise continually to the lamps. If brackets and other things on the frame are in the way, the pipe should bend laterally around them rather than over or under.

4. PROVISION FOR CLEANING.—The larger the pipes, the less frequently will they need cleaning. Brass pipe properly installed may not need to be cleaned as long as the car lasts. When cleaning is needed, however, it should be easy to attach a compressed air hose to the highest point of the pipe line and blow it out. It is also necessary to clean the generator outlet once or twice in a season, since it clogs with lime dust unless the latter is separated by an efficient hair filter.

The accompanying illustration shows how a generator may be piped to the lamps, following the principles above set forth. A is a $\frac{1}{2}$ in. brass pipe having its lowest point close to the generator, and its front end arranged so as not to be in the way of the

mud guard bracket and the bonnet catches. At its rear end is a T-piece B, with a drip cock and a short length of tube to which the hose C from the generator connects. At the front end is a T-piece D, from which a pipe goes across to the other side-lamp. It is desirable, but not essential, that this cross tube shall be of brass, and shall slope upward to the second lamp. The chances are that whatever moisture is in the gas will condense before the point D is reached. Besides this, the warmth of the radiator is generally sufficient to prevent condensation in the cross pipe, especially if the latter is placed behind the radiator and out of the way of the air passing through. The pipe leading up the dashboard to the headlight should be of the same kind as A, and should slope continuously upward from the generator to the lamp. The illustration shows a fabric rubber hose E connected at its lower end to one branch of the Y-tube F. A short length of hose G, from the generator, connects to the other branch of the Y, and a short rubber tube H, with a brass plug in its lower end, affords means of drainage.

To guard further against accidental fluctuation in the gas pressure, and to prevent possible flickering due to unforeseen accumulation of water, a gas bag is attached directly to each of the lamps. These bags perform the further function of settling chambers to prevent any minute solid particles from being carried to the burners by the flow of gas. Obviously few or none of these functions would be properly performed if the gas bags were close to the generator instead of at the lamps.

To blow out any of the piping it is sufficient to disconnect the gas bags, open the drip outlet, and blow through with a tyre pump or a compressed air hose. By opening the generator and the generator gas valves and closing the drip outlets, it is also easy to blow out accumulated lime in the generator outlet. In a generator of the type shown, the two hose connections at the gas valves may be detached, the two valves opened, and a wire passed through them. The bottom portion of the generator may be removed as if for recharging, and a wire run straight up inside the gas passage to the branch connection to clean the latter. Closing one of the valves, a short length of rubber tube may be connected to the other, and the user may blow through this tube while "twiddling" the cleaning wire which he has pushed up into the connection. That will blow down the material detached by the wire, and leave the whole passage clean. This is but a few moments work, and needs to be done but once in a season's ordinary use. Most generators have a wad of curled hair in the gas passage just below the connection to stop the lime dust. Occasionally this should be removed by a bent wire and shaken clean. One can easily tell by blowing through the generator outlet, by means of a test piece of rubber hose, whether the passages are open. An occasional drop of oil on the gas valves will keep them from sticking.

Instead of a drip outlet or small pocket, a gas reservoir may be used. This is a section, ten or twelve inches long, of one-inch iron or brass pipe, which may be located horizontally over the fly-wheel of the engine, lower than the generator outlet, and from which the feed pipes to all the lamps are to be carried. These pipes should slope upward from the reservoir, as the generator connection slopes downwards to it, but it is unnecessary to make provision for draining the reservoir, since whatever moisture gathers is evaporated by the heat of the engine during the day. The condensation is, in fact, so small that it is almost never necessary even to open the drip outlets of the arrangement shown in the sketch, day to day evaporation taking care of the moisture excepting during periods of extremely low temperature.

While on the subject of cold weather, it is worth while to touch on anti-freezing precautions for the generator. Some types of the latter are so extravagant of carbide that the heat of their own internal reaction will keep them from freezing in almost any weather. It is possible to prevent freezing by the addition of salt, but this is more or less objectionable, since the corrosion, although slight, is liable to clog the drip valve and the gas outlet. A better plan is to add wood or denatured alcohol in a proportion of from one-to-ten to one in twenty, according to the temperature. A one-to-ten solution freezes at about 15 degrees Fahrenheit. It is hardly desirable to use a stronger solution than

is actually necessary, because the alcohol is wasted and the water tank becomes emptied faster than if no alcohol were present. Since the vulnerable point is the drip, it is best to use as weak a solution as possible, this not being put into the generator until it is to be used; the apparatus is then protected from freezing partly by its own heat. An additional safeguard would be a hood, such as may easily be made from flannel-lined rubber cloth similar to the hoods frequently carried on the lamps. With a protection of this kind no alcohol need be added unless the temperature gets considerably below that which the greater number of motorists find agreeable.

THE RIPERT MOTOR TYRE.

WE illustrate herewith a sectional view of the new motor tyre lately brought out by the Société des Pneumatiques Ripert, of 7, Rue de Normandie, Asnieres, Paris. As will be seen, the feature of the new tyre is the tread, which consists of a number of strips of chrome leather, set on edge and held in position in the specially shaped outer cover by studs passing laterally through the

cover and the leather. The studs are made of Swedish iron, while the washers are of ferro-nickel. The outer cover is so formed that no part of the leather comes in contact with the inner tube. It is claimed for the new tyre that not only is it extremely durable but that it does not heat.

MOTORISTS who indulge in golf—and their name is legion—will be interested in the formation of the Temple Golf Club at Temple Park, between Maidenhead and Marlow, in the Upper Thames Valley. Viscount Royston, whose interests include motoring and ballooning, is on the committee, and we hear that a motor service will be established from the railway station at Maidenhead, so that members may be on the first tee within an hour of leaving London.

THE chauffeur anxious to keep his car in good condition and to reduce the running expenses will use a rainy day to good advantage by painting the rims to protect the tyres from rust. After removing the tyres the rims should first be cleaned of all dirt and rust and then given a coat of japan. Another coat should be applied after five or six hours, and the tyres replaced only after the japan has become hard and no longer feels sticky when touched. Rust is very destructive to tyre fabric, and a protective coating on the rims tends greatly to preserve the beads of outer covers.

IN the connecting up of batteries and coils it has generally been recommended that the trembler screws be made "positive," so that whatever platinum is carried away by the continual passage of the current may be taken from the screw and deposited upon the contact point of the trembler. The theory is that the screw is cheaper and easier to replace than is the trembler, and that, with this arrangement, the trembler point builds up rather than wears away, requiring only the smoothing off of the extra metal deposited upon it to keep it in perfect condition.

SCOTLAND YARD MOTOR-'BUS TEST.

INCIDENTS AND IMPRESSIONS OF A LONDON TRAFFIC AND HILL TRIAL.

HAVE an invitation to attend Scotland Yard this morning with the 'bus. Will you join in?" Thus came the message over the 'phone a few mornings ago, from the engineer of a suburban motor company, and I at once accepted the invitation.

Fortified with a notebook and a camera, I presented myself at the depot just as preparations had been completed for the journey to town—some fifteen miles. The 'bus was one which had been especially purchased and prepared for the requirements of a new outer suburban service, or rather a projected service, for the official permit of Scotland Yard has first to be obtained for the running of the vehicle.

An outer suburb, I would explain, considers itself as something distinct, and perhaps rightly, from the common or garden variety, as there are no cheap fares, trams, theatres, music-halls, &c., of suburbia proper. The roads also are considerably smoother and better than nearer town; there are no trams, and, thanks to enterprising road treatment, no mud or dust. To be in keeping with such, the 'buses would naturally need to be of a high standard of

The German Daimler Motor Company has recently supplied about fourteen motor delivery vans for use in connection with the Parcel Post Service in Bavaria. The above illustration depicts two of the vehicles, the large one being of 28-h.p. and the smaller one of 16-h.p.

excellence. The one referred to certainly appeared to fulfil these requirements.

It boasted of a body of polished teak that would do credit to the most reputable firm. The interior was tastefully upholstered, with acetylene gas installation and other refinements. The engine was powerful, quiet-running, and free from smoke or smell, whilst the vehicle, newly painted and varnished, presented an eminently respectable appearance.

As it was raining, I donned a waterproof before taking my seat beside my friend at the wheel. A mechanic travelled inside to keep an eye on small boys and others. The engine was in excellent tune and started with a turn of the handle. For several miles the way lay over smooth suburban roads and the best speed of the vehicle was registered. I say best speed, because the top speed even of a powerful and modern 'bus, less passengers, is not greatly in excess of twenty miles an hour. It is a phase of motoring that cannot be said to be very pleasurable and highly exhilarating. On account of the low gears, and at the high speed at which the engine runs, travelling seems extremely slow, there is little response to the throttle, and the narrator of car runs is somewhat at a loss to describe the experience. I can imagine no more drastic punishment for the worst type of road hog. A month or

two's enforced 'bus driving would cure him of his speed proclivities for ever.

The unmistakeable warning of a Gabriel came from behind, and a big Renault landaulet skimmed by, and seemed to leave the 'bus as though standing still. Instinctively my friend kicked at the accelerator pedal and the speed of the 'bus increased a mile or two. The Renault was soon lost to sight around a corner of the road ahead. Running into the outskirts of town, with the trams and traffic the regulation twelve miles per hour was necessary. One cannot accelerate as on a car, and it is advisable to follow in line behind such things as trams, as overtaking and repassing is attended with considerable risk.

We reached Scotland Yard with a clean sheet, and, driving into the yard, took up position beside two other 'buses and a row of cabs. My friend thereupon decided to advise the licensing officials of his arrival. To find them, however, was no easy matter; but, by dint of much elbowing in a chamber packed with would-be drivers and others, he at length gained access to a functionary seated at a desk. The latter, however, gave no hope that an interview would be accorded within an hour for the very least. Leaving the mechanic in charge of the 'bus, my friend and I accordingly adjourned for lunch to a neighbouring hostelry.

Returning to the Yard we found the 'bus was coming in for a good deal of attention from the drivers and deadheads who frequent the precincts of the place. After a further wait two individuals attired in long drab coloured overalls appeared and advanced towards the 'bus. Interest was now centred in their operations. One with a long flat rule took careful measurements of the height, wheel base, wheel track, &c.; for this purpose a reel tape was also utilised. The writer took a snapshot, but unfortunately the poor light resulted in an inadequate exposure and a record of the proceedings was lost. The measurements finished and duly entered in a notebook, an inspection was made of the engine and general details of the machine. These completed, my friend was instructed to make the running test. One official seated himself next to the driver, the other took up his position on the step, the writer and one or two others electing to travel inside. The engine was started and the trial commenced. Along the Embankment the 'bus ran smoothly and well, passing some trams and other vehicles. The official elected to remain on the step. Now and again he would cast a glance round and sniff for petrol and smoke fumes.

Certainly the vehicle travelled well. Glancing at my friend at the wheel I noticed he drove calmly and without any fluster. The 'bus was directed up Arundel Street. I am not sure of the gradient, but the surface was decidedly greasy. Half-way up the bus stopped. Only a brake test, and it continued. Another stop. This time with a jerk, and the official who was walking alongside made an entry in his notebook. At the word go the machine again started with a do-it-again-as-often-as-you-like air that must have satisfied the most critical, and there were a fair number of spectators of the trials. Doubtless they took it for a new type of vehicle undergoing a trial run.

Thus far the test had been successful. Despite the sudden calls for acceleration there was little trace of smoke. The 'bus, indeed, travelled quietly in comparison with certain of the "regulars." Thence along the Strand into Fleet Street. Here the difficulties inseparable from the passage of that crowded thoroughfare began to make themselves felt. A covered-in van suddenly turned on to the wrong side of the road, calling for hasty application of the pedal brakes. The vehicle answered the test well and was evidently comfortably settling down to the trial. The official observer on the footboard appeared by no means perturbed by the enquiry of a boy as to how far we went for a penny, and with a wave of the arm he checked an individual who would have boarded the 'bus during a traffic stop. Then through the thick of the traffic at Ludgate Circus on to the Embankment again, and the starting point was soon reached, the 'bus being deftly steered into the somewhat narrow portals of the Yard.

The trial was over, and the official observers dismounted and after another brief inspection and further notes they departed. And the judging and award. Only Scotland Yard can decide!

C. M. F.

THE SOCIAL WHIRL.

THE King, with the Prince of Wales, Prince Arthur of Connaught, and several of his Majesty's guests, motored from Sandringham on Monday morning to Houghton Hall, to honour Colonel Ralph Vivian with a visit. Lunch was served at the Hall, and the King and the Princes returned to Sandringham House in the afternoon.

QUITE early one morning just before Christmas the Princess of Wales and her son, Prince Edward, made a surprise visit to Gamage's Emporium in Holborn, arriving from Marlborough House by motor-car, attended by an equerry. They went through nearly all departments of the extensive premises, making several purchases, and showing much interest in the Christmas bazaar. On the next day Princess Victoria of Wales, attended by Lady Eva Dugdale, followed their example, and spent a considerable time in Gamage's.

ON Saturday Lady Llangattock went to her country residence, the Hendre, from Monmouth by balloon. The trip was made in her son's "Mercury," and by utilising the air currents after leaving the ancient city they were able to land on the lawn in front of the house. The Hendre will be remembered by the older generation of motorists as the scene of one of the most successful meets of the central motoring organisation when it was known as the A.C.G.B.I.

WHEN returning from a Christmas Day party to friends at Llandudno, Mr. J. Edwards, of Coed Mawr Hall, near Conway, who was driving his motor-car, collided with the Llandudno Post Office mail van near Llandudno Junction. Mr. Edwards, who was driving the car, had a remarkable escape from injury, but his wife was thrown out and received a severe contusion on the back of her head. Her maid, seated in the back of the car, was unhurt, and the horse attached to the mail van was also uninjured. Unfortunately the driver of the Post Office vehicle sustained severe injuries.

MR. W. BECKETT HILL, the Liverpool manager of the Allan line of Canadian steamers, whose death took place on Saturday, was greatly interested in automobilism. He was the chairman of the Liverpool A.C. and Self-Propelled Traffic Association, and did much to secure the success of the early commercial vehicle trials in the city on the Mersey.

CONGRATULATIONS to Mr. Richard Sutton Clifford, of Loughborough, on his marriage to Miss Constance Wright, of Leicester. Mr. Clifford is a member of the Leicestershire, Derbyshire, and Nottinghamshire clubs, and well known in Midland automobile circles generally.

MR. T. W. STAPLEE FIRTH was the solicitor who instructed Mr. Tindall Atkinson, K.C., in the case reported last week, in which the Motor Union secured a writ of *certiorari* to issue against Mr. Flowden to show cause why the conviction of a motorist should not be quashed.

MAJOR LINDSAY LLOYD, who, as already announced, is the new Clerk to the Course at the Brooklands Track, took an active part in the organisation of the Gordon Bennett eliminating races held by the R.A.C. in the Isle of Man. He was for some time the Secretary of the War Office Committee on Mechanical Transport, and is also interested in marine motoring. For the last seven years he has been a member of the committee of the R.A.C.

THE death of Mrs. Neville in an unfortunate motor-car accident throws many leading families into mourning. She was the wife of Mr. Ralph Neville, of Wellingore Hall, near Lincoln, and a cousin of Lord Lovat through her mother, Mrs. Scott-Murray, who is now living, at an extremely advanced age, at Bourne-mouth.

LOLLIUS.

HERE AND THERE.

THE Fife Motor Company have a well-equipped garage and motor repair workshops in Victoria Terrace, Dunfermline.

A NEW motor puncture-proof tyre, made under Thorne's steel-woven patent, is being put on the market by Tesama Limited, 6, Major Street, Manchester.

THE most popular mechanical toy with Parisian children this Christmas has undoubtedly been the aeroplane, this having quite displaced the motor-car in juvenile estimation.

A NEW addition to the list of engineering societies is the Internal Combustion Engineers' Association, which has just been formed in Chicago. The society aims to advance, in the broadest possible manner, the interests of internal combustion engineers.

ONE more has been added to the already long list of those who claim to be the original inventors of the motor-car. It has just been recalled that Elijah Ware, of Boston, U.S.A., a well-known railway construction engineer in his time, invented a steam automobile as early as 1861 and ran it on the streets of Boston.

The Gross Airship passing over the Brandenburger Thor, Berlin.
[Allgemeine Automobil Zeitung.]

AN electric motor-car has been designed by the engineer-in-chief of the Metropolitan Asylums Board to convey to the inmates the cottages of that authority, which are scattered over a site of 100 acres, their hot meals. The car can be arranged to run forty miles on a single charge and the maximum speed is sixteen miles per hour.

THE Daimler Motor Company (1904), Ltd., have built and equipped an extensive repair establishment at Highgate Hill, Upper Holloway, London, N., where skilled mechanics and a modern plant will ensure the prompt and effective execution of orders entrusted to them. The repair works at Brownlow Mews, Guilford Street, W.C., have been closed, and all work previously done there will be carried out at the new address.

WE announced some months ago that Messrs. Dennis Bros., Ltd., of Guildford, had added to their many activities that of the construction of petrol motor fire engines, a department which, judging from the experience thus far, promises to become an exceedingly important one. In connection with it the firm have just issued a special motor fire engine and ambulance catalogue, in which full details are given of the Dennis-Gwynne motor fire vehicles, as well as a tabulated statement of their advantages and particulars of the various tests they have been put to in different parts of the country during the past few months. The second half of the list deals with the Dennis motor-ambulances, illustrations and specifications being given of vehicles similar to those supplied to the Metropolitan Asylums Board and other bodies.

MESSRS. J. T. HARMAN AND CO. have lately supplied a 24-h.p. Vinot car with limousine body to the directors of the Anglo-American Oil Company, Ltd.

MR. W. G. BELL, of Milford-on-Sea, Hants., sends, with compliments, the "X.Y.Z. of Bridge," a reminder of the Victoria Motor Garage which Mr. Bell directs for the convenience of visiting motorists.

THE SOCIÉTÉ DES AUTOMOBILES PEUGEOT have taken out a patent for the cooling of the brakes of a motor-car by a circulation of air in the brake drums produced by an ejector operated by the exhaust gases or by a pump or blower driven by the motor.

WE learn that Messrs. Swan, Ltd., of Pentonville Road, King's Cross, London, N., are bringing out a new car, which is to be called the "Williams." The vehicles, which are being built for the company by Vauxhall Motors, Ltd., will comprise two models of respectively 15 and 20-h.p.

THE Komet, Maschinen und Motorenfabrik (Gebrüder Buchholz), of 63, Koppenickerstrasse, Rummelsburg, Berlin, has recently brought out the device illustrated herewith, which should prove extremely useful to motor-car transport agents and packers, as well as to railway companies having much motor traffic. As will be seen, it consists of a wheel-holding block made up of a wedge and hooks; one of the blocks is placed in front and behind each

of the road wheels, and securely held in place by knocking the hooks into the platform of the lorry or railway waggon. The device is stated to be already in use on some of the railways in Germany, and enables a car to be transported without any risk of the paint being damaged, as often arises when the vehicle is secured by ropes.

THE BRADFORD VULCANISING COMPANY, of 96, Manningham Lane, Bradford, who introduced the "Bradford" non-skid tyre, and who have plant for vulcanising tyres of every description on the premises, send an attractive calendar. This will serve to remind Yorkshire motorists of the facilities possessed by the company for dealing with tyres which have had considerable wear.

MR. D. J. CHANDLER, of Fitzroy, Victoria, has recently returned from a tour of about 800 miles on his 16-h.p. Bentall through that state and the adjoining one of South Australia. He writes, that "We were unfortunate in meeting rain, and had wet weather five and half days out of seven and half. At Strathdownie we were delayed by rain two days, and the country being level and swampy, we had to travel through four and half miles of water in one stage of fourteen miles; at one spot it was so deep it came up over the engine and stopped us for two and a half hours. We bound rope around the tyres and got through many greasy spots. The time taken to do fourteen miles from Strathdownie to the border was four and a half hours. After crossing into South Australia the roads were in perfect order, and we cut out the fourteen miles from the border to Mt. Gambur in thirty-five minutes. We had many other experiences on this trip. I could mention on two occasions having to dig out the car when it had sunk in the wet sand right down to its bed."

MESSRS. MARTINS, Bow Bridge, London, E., have just supplied a 35-h.p. Saurer motor lorry to a firm of brewers in Gothenberg, Sweden.

MR. C. C. MARTIN, of the Station Hill Garage at Chippenham, is commencing to run motor-cars for hire in connection with his business as a job master. He also is putting in a repair plant, and will, when this is complete, be in a position to undertake any class of motor repair. Already he has garage room for between twenty and thirty cars, and intends to commence the New Year well equipped for dealing with the requirements of any motorists who may be passing that way.

DURAY, the well-known driver of Lorraine-Dietrich racing cars, was last week concerned in a motor accident. He was being driven in a limousine from the company's works to the exhibition at the Grand Palais, when, to avoid a man with an unlighted hand-cart in the Boulevard Maillot, Paris, the driver swerved. The car mounted the pavement and ran into a tree. The driver had to be taken to the hospital, while Duray sustained an injury to one of his knee-caps which will confine him to the house for some weeks.

THE Dennis motor fire-engine, recently purchased by the Bradford City Council, is doing some wonderful feats in the matter of getting to fires quickly. The other day, in response to an alarm, it did the journey to Odsal (some three miles) in seven minutes. It had no sooner been berthed again at the Central Fire Station than another call was received—this time from Gomersal, six miles away. The engine got to the scene in the short space of fourteen minutes, as against about thirty-five minutes "horse time."

MESSRS. ACER, LTD., Hanwell, W., are at work on the construction of a new motor tractor for agricultural and general haulage purposes. The motive power is supplied by a 27-h.p. engine of the double-cylinder, opposed horizontal type, adapted to use either paraffin, petrol, or other spirit as fuel. In addition to a pulley for driving a threshing machine or other stationary work, a special feature of the tractor is a winding drum, which can be rotated at four different speeds, and by means of which a powerful hauling or lifting effort can be obtained when desired.

THE latest patent of the Daimler Motoren Gesellschaft, the makers of the Mercedes cars, is one relating to water circulation on petrol cars, provision being made for circulating the water round the change-speed gear-box and the engine base chamber as well as through the cylinder jackets. The water first passes from the radiator to the lower part of the gear-box, and is thence conveyed by bent tubes to the intermediate and upper sections of the same. It is then passed round the crank chamber and through the circulating pump to the cylinder jackets, and back to the radiator.

FROM the Sheffield-Simplex Motor Works, Limited, comes a copy of the 1909 catalogue of the Sheffield-Simplex six-cylinder cars. In the introductory pages of this particulars are given of the special claims made for these cars, and of the gear-box-less model. Attention is also directed to the specially favourable conditions under which the cars are manufactured in the heart of the Sheffield steel industry. A number of testimonials bearing witness to the general satisfaction from satisfied owners of the vehicles are followed by the reproduction of some photographs depicting actual incidents which occurred during the exhaustive tests undertaken before it was decided to adopt the gear-box-less model for open touring cars, and some interesting particulars are given of the many well-known severe hills which were surmounted during these trials. Independent evidence of the genuine nature of these performances, and of the successful running of this new type of car, is furnished by the testimony and impressions of various motorists of experience. Very complete chassis specifications of both models follow, and the catalogue concludes with a number of body illustrations and quotations, and a handy table which gives at a glance the price of sundry extras and accessory equipment, including various brands of tyres in applicable sizes, the aim of the company having been to put before their clients under one cover all the necessary information required to facilitate the ordering of a chassis or fully-equipped car, without reference to the considerable number of catalogues which so frequently have to be resorted to in calculating the complete cost of a vehicle.

THE FARCOT AERONAUTICAL ENGINE.

WE have already described and illustrated several of the special motors designed for use in connection with flying machines which were on view at the Paris Salon. This week we are able to illustrate another very interesting motor—the Farcot, made by M. J. Ambrose Farcot, of 9, Boulevard Denin, Paris. It will be seen from Figs. 1 and 2 that this comprises eight horizontal air-cooled cylinders, set at equal distances around the central vertical crank shaft. The cylinders are arranged in two planes, four working on to one crank pin and four on to the second, set at 180 degrees to the other. For the purpose of keeping the cylinders cool, a fan A is mounted on the upper end of the crank shaft. Two systems of ignition are provided, accumulators and high tension magneto; the latter is intended to be located on the platform B, and to be driven off the crank shaft by bevel gearing.

A novel feature of the engine is seen in the combination inlet and exhaust valve fitted to the cylinders. Two views of this valve, as also of the valve operating cam, are given in Fig. 3. It will be seen that the valve works in the opposite direction to the usual method, that is to say, when closed for compression purposes it abuts against the upper portion of the valve pocket. The latter is surmounted by a perforated dome D, to the centre of which the admission pipe is connected. This pipe extends a cer-

Figs. 1 & 2.—Sectional Elevation and Plan of Farcot 50-h.p. Eight-Cylinder Engine for aeronautical purposes.

tain distance within the dome as shown at F. To the top of the valve S is attached a hollow cylinder with bell mouth C, in which at a certain height holes are formed in the sides. For exhaust purposes the valve only opens a certain distance, the holes in the cylinder being then just above the end of the admission pipe, so that no new gas can then find its way into the engine. The dome D acts as a silencer, the burnt gases passing out to the atmosphere through the holes formed in it. A wire gauze is provided to prevent any flame from being emitted to the outside air. On the suction stroke the valve opens a further distance

than for the exhaust, the gas then finding its way from the admission pipe through the holes in the cylinder piece C into the explosion chamber, as shown by the arrows. The arrangement is such that as the fresh gas passes in a suction action is set up within the dome D, a small supply of additional air being drawn in to dilute the mixture.

As already mentioned, the crank shaft is arranged vertically; mounted towards its upper end is a bevel pinion C, in mesh with

Fig. 3.—Sectional Views of Farcot Combination Inlet and Exhaust Valves and Valve Gear.

The drawing on the left shows the position of the valve at the period of exhaust; the central view shows the valve open for admission, while the illustration on the right depicts the double-bossed cam.

the large bevel wheel D, on the shaft F, on which the screws for propelling the aeroplane are mounted.

M. Farcot is making three sizes of the eight-cylinder engine, viz., 30 h.p. (80 mm. bore by 90 mm. stroke), 50-h.p. (105 mm. by 120 mm.) and 100-h.p. (130 mm. by 135 mm.) The 50-h.p. motor measures 3 ft. 8 in. by 3 ft. and weighs complete in running order 112 lb., or about 2½ lbs. per horse-power. During a long test on the bench it is stated to have developed 69-h.p. at a speed of 1,200 revs. per minute.

THE "Trader" handbook and diary for 1909 comes to hand in its usual excellent form, with several new features adding considerably to its interest. This has become a standard work, and many of the lists and much of the information contained therein will be of value to those engaged in the automobile trade.

It is apparently of little avail to urge upon those who conduct some of the great journals the necessity for careful differentiation between accidents in which the automobile is involved as the victim and those in which the motor-car is the aggressor. All such mishaps are generally reported as "motor-car casualties," being headed in such a way as to convey to the casual reader the impression that the motor-car is really responsible for such accidents. Now that an organisation has been formed which bolsters up its case for the protection of the highway by statistics which require careful classification before publication, the warning may, however, be again repeated in the hope that some effect may be made upon the policy.

A CONFERENCE to consider the resolutions passed at the International Road Congress held at Paris in October is to take place in London early in May. This is being convened by the County Councils' Association, of which Mr. G. Montague Harris is the secretary, with the assistance of representatives of the various associations concerned with Corporations, District Councils, Municipal and County Engineers, County Surveyors, &c. All who are interested in the problems of highway maintenance are invited to support the Conference, the membership of which can be obtained at a fee of £1, and it is to be hoped that the motoring organisations will take care to see that the automobile position is clearly understood at the Conference. The points under discussion, apart from the matters of administration and finance, include road signs, dust, the protection of the footpaths and motor traffic. In the latter division we notice the subject is to be discussed in various aspects, including contributions to rates and taxes, licences and registration, speed, weight, wheels, tyres, identification marks, and the disposal of penalties inflicted on motorists for contraventions of the Act of Parliament.

Correspondence.

[Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, London, W.C.]

MOTOR TAXI-CABS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. T. Ashmole *re* taximeter charges, I wish to point out the correct method is to take the number of the cab and report its inaccuracies to Scotland Yard. The cabman naturally resents being paid short money, as he is obliged to pay into the company whatever his meter records. I might also add that the meter is a combination of time and distance, therefore varies according to the traffic.

In respect to the latter part of your correspondent's letter I venture to remark that nearly a century has passed away since Mr. Pickwick was engaged in fisticuffs with his cabman, and times have changed for the better. If Mr. T. Ashmole stands in Regent Street, he will see that ladies prefer the taxi not simply for its speed, as speed is not required in shopping, but because the driver is invariably polite; he leaves his seat to open his cab door, minds the parcels during the absence of his fare, hands in their cards at the houses of their friends, and on dark evenings always waits till he sees them safely in the house to which he is directed to take them. I do not say there are no cads driving motor-cabs, but what I do say is that the cad will not show the cloven foot, and his Billingsgate will not be forthcoming unless he is cheated and he is certain that the fare in his cab is the same type of being as himself.—Yours truly,

LEWIS WILSON.

The Annual Dinner of the Long Island Automobile Club.

The annual banquet of the Long Island Automobile Club, lately held at Brooklyn, N.Y., took the form of a "Beefsteak Dinner," at which the members and their guests, to the number of nearly 200, were dressed in the unusual costume seen in the above illustration.

INDIVIDUALITY OF DESIGN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been quiet for quite a long time, but after reading the several motor papers I feel that I must express some views that I have until now bottled up. Olympia has left me in a wilderness of nothingness. Why has the Daimler firm left the ranks of orthodoxy and built and fitted such an engine as the Knight, and, in short, any engine but their own, to apparently the entire elimination of their standard design? I have read all the papers on the new engine, and I have been so surfeited with enquiries of the Silent Knight, as has everyone else knowing anything about motor-cars, that I am now more silent than the night about them. I made a steam engine in 1902 with sliding ports arranged similarly to those in the Daimler engine, but in this case the crosshead move the inner shell radially and I am bound to say it worked all right until the shell stuck. One more thing before I leave the subject. Why did the designer allow the opportunity of adopting an auxiliary exhaust port to go unheeded? Surely this would have been advantageous where two shells are expected to work vertically under tremendous heat and enormous frictional contact.

Now, why has the Lanchester firm left their own beaten track, and eventually submitted to the prejudices of the buying public? They might just as well now build the ordinary bonnet and radiator and so drop one of the finest cars that was ever built. Ask any driver of a Lanchester, new or old, which form of steering he would prefer, and I am quite certain that ninety-nine out of a hundred would plump for the tiller. You could

drive the car through the eye of a needle with it, comparatively speaking. The control is modified, too. I cannot imagine anything neater or more efficacious than their hand speed lever control, without pedals and side levers, and certainly their cars cannot be driven anything like so gracefully as was possible with the tiller steering and left hand control. I believe all owners and drivers of the typical Lanchester are faithful to it, and I should strongly advise prospective purchasers of these cars to try the original. The difference is the beauty of it, and surely the man who rows a boat can paddle a canoe and enjoy the change of position and condition. How many of the advocates of the chain drive, too, are giving their attention to live axles? I quite expect to see Mercedes steam cars and Panhard electromobiles, for instance, in the near future.

Now that the show has gone past, which is the car, the best value for money, handiest, simplest and most reliable, of course? All makes were not represented. One of my choice was not on show. I shall endeavour to say more on these matters, and on steam cars in particular, at some future time.—Yours truly,

HERBERT J. CHAPMAN.

THE PETROL PERIL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I find our sale of petrol in small quantities for domestic use, viz., cleaning small articles of wearing apparel (mostly belonging to the fair sex), is greatly increasing, and I think it a duty to issue a note of warning against the use of this highly-inflammable spirit for cleaning purposes. The growing familiarity with petrol has a tendency to make those who are not familiar with the use of this spirit careless. Gunpowder remains where it is placed; petrol, being volatile, does not. There is an authenticated case of the vapour from this spirit having travelled a distance of 30 feet, taking fire, and bringing about a serious conflagration.

It cannot be too strongly impressed that the use of petrol in a room where there is a naked light or fire is highly dangerous. It might also be pointed out that to pour this spirit down a drain is an infringement of the law, and lays one open to proceedings being taken against them. In more than one instance the result of such an action has been to cause serious damage. In case of a fire, the use of water to extinguish petrol only increases the danger, as the light spirit burns and floats on the water, and the tendency is to increase the zone of danger. The method to adopt is to use one of the patent fire extinguishers, a syphon of soda water, sand, or soil, and, in cases of a small fire, to beat it out.—Yours truly,

THOMAS W. KEMP.

A CASE OF POOR WATER CIRCULATION AND THE CAUSE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some time I was troubled with overheating of the engine in my Clement-Talbot car. I tried solutions galore, had the pump down, pipes off, in fact, ran through the whole procedure, but could not find out the cause of the trouble. The circulation seemed all right, apparently, inasmuch as the water was circulating, though not effectively. This being so, I naturally thought that it occasionally became air or steam locked. On my runs I had to fill up about every fifteen miles, the water having boiled away. At last I acquired the services of Mr. Downs, who styles himself "The Car's Physician," and I got him to come and spend an hour or two on the circulation. After a quarter of an hour he found the overheating was caused by an irregular lump of metal in the water tank, which evidently jumped about and sometimes got over the water outlet from the tank and at other times freed itself. I need not tell you how pleased I was, as, previous to this, I was contemplating selling the car.

To others suffering from overheating troubles this might be a good tip, as one never knows what is in a water tank; it is the last place you would expect to find an obstruction like this.—Yours truly,

S. L.

EXPLOSIONS IN THE INLET PIPE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could assist me in ascertaining the cause of explosions in the inlet pipe, and sometimes in the carburettor. The latter is inclined to flood when the air inlet is half off or closed. If it is a bad carburation, how is it ignited in inlet pipe? The car is a four-cylinder one and runs well, but suddenly developed explosions. Both high tension accumulator and low tension magneto ignition are fitted.—Yours truly,

W. FERGUSON.

[The trouble referred to by our correspondent is usually caused by a leaky inlet valve allowing a portion of the ignited charge to

pass back into the inlet pipe. Sometimes too rich a mixture will cause this, especially when the engine is suddenly throttled down. We would advise the grinding in of the inlet valves. Also see that they are well down on their seat; they may be touching the tappets, slightly holding them off their seating.]

TROUBLE WITH AUTOMATIC INLET VALVES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an old car fitted with a two-cylinder engine. After starting motor I find it blows back into the carburettor every now and then, especially when running quick. I have ground the automatic inlet valves in and also fitted new ones, but this does not alter it. Would it be caused by the exhaust valves? I also find the water gets very hot although there is good circulation with the pump. I shall be obliged if you can be of any assistance in solving the cause of the trouble.—Yours truly,

NOVICE.

["Novice's" trouble is no doubt caused by the valve springs having become weak. We would advise putting stronger ones on to remedy the firing back in the carburettor. The overheating is in all probability

USING THE ENGINE AS A BRAKE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some two or three years ago there was quite a long discussion concerning the merits and demerits of using the engine of a petrol car as a brake. Week after week whole columns were filled with letters from people who were chary of attempting to find out for themselves how the idea would work, because they were afraid the engine might be damaged. Others—and these were in the majority—altogether derided the efficacy of the plan, even when the few who knew what they were writing about testified by the light of hard experience.

Being very much interested in the subject, I made a careful inquiry at the recent Olympia and Paris Shows and found that quite a number of makers have now so arranged their engines and carburettors that when running downhill with the throttle entirely closed a charge of fresh cold air can be drawn in at each suction stroke of the pistons. In this way not only is the cylinder thoroughly scavenged, but a braking effect is obtained which saves the ordinary brakes considerably, and gives a greater feeling of security to the driver in going down long steep hills.—Yours truly,

MAZAGRAN.

An anticipation of the Aeroplane Competition which is to take place at Monaco from the 24th inst. till the end of March.

caused by the cylinder head being carbonised inside; to remedy this, it will be necessary to remove the cylinders and clean out the same. This should effect an improvement if the water circulation is good.]

THE POSITION OF HEADLIGHTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—There seems to be some difference of opinion among motorists as to the proper method of setting the headlights of a car which is to be given any great amount of night work over rough roads. By some drivers it is held that it is best to place the lamps in such a way that the rays of light shall be thrown out in perfectly parallel and horizontal planes. Others hold that the light should be focussed on the road at a point not too far distant from the front of the vehicle. To this end the lenses are sometimes placed so that the light is concentrated on a single point, while in others the rays from one of the headlights are directed forward and at only a very slight inclination below the horizontal plane, while those from the other are directed at the ground only a short distance from the front of the car. I should be glad to hear the opinions of other readers of the *M.C.J.* on the matter.—Yours truly,

A. LAWRENCE.

TENDENCIES IN DESIGN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re correspondence "Tendencies in Design," having been unfortunate with tyres, I agree with the writer of the letter, "Argyll," that the real improvement now lies in the direction of a really effective substitute for pneumatic tyres, and as there have been several resilient and spring wheels each claimed to be an improvement on the pneumatic tyre, I should like to know the name of the makers of the wheel "Argyll" refers to.

I notice he says nothing about the solid treads, which I understand are somewhat of a trouble. What size is used, what is the average life, and what method of fitting to the rim is used?—Yours truly,

TYRED.

MR. N. G. NEER suggests that the R.A.C. should adopt the Proportional Representation plan in the election of the Club committee:

TENDENCIES IN DESIGN.—As we have mislaid his address, we should be glad if "Argyll," whose letter appeared in our issue of the 19th December, would communicate with us.

THE FUTURE OF ALCOHOL AS A MOTOR FUEL.

(Concluded from page 942.)

ALCOHOL can stand admixture with air in proportions varying from 4 to 13 per cent. (about three times the range of petrol), burning with odourless and smokeless exhaust, a consideration of no small account. This increase in range of admixture also permits the operation of the engine under widely varying degrees of load and speed; and, by rendering the throttle so much more flexible, brings the internal combustion motor nearer to the steam engine in this respect; in so doing sensibly diminishing the need of some of the different speed gears. For the reasons cited, and provided alcohol can be found to approximate the power-giving qualities of petrol, under similar conditions, there can be no doubt that when it becomes necessary to provide a successor for petrol, that successor will be found in alcohol. One of the main essentials of a fuel for the internal combustion motor is that it shall burn rapidly, the efficiency of the engine depending on the complete combustion of the charge during the first fraction of the power stroke. This is more especially true of the high speed motor, in which alcohol, which is a slow burning fuel when under moderate compression, has not time enough to burn completely, and is expelled at the exhaust partially unburned. This characteristic of alcohol is modified when the vapour is more highly compressed, and when compression is carried to from 150 to 200 lbs. to the square inch, alcohol proves an even more efficient fuel than petrol. But increase in compression means a longer piston stroke and slower speed—in other words, the employment of a different style of engine. In Germany and Cuba, where alcohol is cheap, a good many high compression engines are in use; but this use is limited to places where they can have the supervision of a skilled attendant. With the high compression required the initial force of the explosion is very

The practice of converting historic houses into hotels or boarding establishments is growing. A recent instance is found in Leasowe Castle, near Birkenhead. It is a very popular resort for motorists in the Liverpool district, the illustration showing three Humber cars outside the Castle.

great—from 600 to 800 lbs. per square inch—necessitating a heavier and more bulky engine, and, besides the danger attending even the experienced handling of such an instrument, constant care must be exercised to keep the piston rings tight, the loss of compression meaning a large reduction in efficiency. For these among other reasons it is not thought that the high compression motor will ever come into popular favour, and we must look to some means for increasing the speed of flame propagation of alcohol in the low compression motor to arrive at a satisfactory solution of the problem. In the low compression motor of from 200 to 500 revolutions per minute, having a long piston travel, alcohol shows to better advantage than in the low compression high speed engine, the reason being that more time is given for burning the fuel; so that, though it be bad practice to burn the fuel throughout the stroke, it is better to do that than to exhaust unburned fuel.

Coming to a consideration of the efficient use of alcohol in engines running at 1,000 revolutions per minute and upwards, we find that the most practical suggestions have been along the line of enriching alcohol with carbon, and accelerating its rate of flame propagation in the cylinder, in order to bring alcohol into the same plane of action as petrol. In this connection it may be pointed out that in Paris the motor-buses use a mixture of half benzol and half alcohol; which, though not forming so good a fuel as petrol, yet, owing to the high price of the latter, proves economical and fairly satisfactory. But if this combined fuel

were entirely suitable, it could not attain a prominent position in the fuel controversy, because a supply of benzol at a moderate price could not be maintained. Investigation shows that acetylene, which contains the same percentage of carbon as benzol, can be used with alcohol to enrich the latter, and acetylene, when thoroughly mixed with a gaseous charge of alcohol and air, is found to possess the further property of vivifying the mixture, and, upon ignition, to cause the alcohol to burn with rapidity. A peculiarity of this vivifying effect of acetylene upon alcohol vapour is that the acetylene is only required to be used in very small proportions, it being essential, however, that the small quota of acetylene employed be thoroughly mingled with the explosive charge, and not pocketed or stratified therein.

In the event of acetylene being extensively used with alcohol as fuel for the explosion motor, there need be no concern about its ample and cheap supply, for calcium carbide, from which, by the action of water, acetylene is generated, can be manufactured in practically unlimited quantities, whenever and wherever it is required.

It appears therefore that alcohol is to be brought up towards the petrol standard through the medium of some agent which both enriches it with carbon and quickens its combustion. As against such method, other attempts have been chiefly in the direction of changes and modifications of petrol carburetors to suit the new fuel—in atomizing, vaporising, and mixing devices—overlooking the fundamental characteristic or physical deficiency of alcohol to be its slow rate of flame propagation, and that no matter of carburation can affect that peculiarity.

Difficulty in starting internal combustion motors when cold is experienced with alcohol as the fuel, this trouble usually being met by priming with petrol until the cylinder warms up. When either benzol or acetylene is mixed with the alcohol, however, the engine may be readily set in motion. With respect to the formation of acetic acid in a low compression cylinder using alcohol as the fuel, and the consequent erosion and pitting of the valves and valve seats, this is probably due to incomplete combustion, for it is found that where the alcohol is completely burned there is an entire absence of these deleterious effects.

To sum up, the whole situation may be epitomized in the statement that petrol is bound to go, and, since alcohol is its most likely successor, it is not too early for serious minds, in the interests of the motor industry, to devote earnest thought to the important subject of the efficient use of alcohol with the present high-speed, low compression engines.

CASES AGAINST MOTORISTS.

REASONS FOR SPEEDY TRAVEL.

At Bearsted (Kent) Petty Sessions, a Bristol motor-car driver has been summoned for driving a motor-car at a dangerous speed. The gentleman who was being driven by the defendant said that he was trying to catch the Boulogne boat at Folkestone. The driver had forty-five minutes in which to do nearly thirty miles. A fine of £15 and costs was imposed.

A chauffeur charged at Blackpool for recklessly driving a motor-car urged in defence that he had a doctor on the car, who had been called from a party to attend a dying man at St. Anne's. The Bench thereupon allowed the summons to be withdrawn on payment of the costs.

ACCELERATION.

At Penrith, Charles Sinclair, Grahamslaw, Roxburghshire, has been charged with driving a motor-car at Penrith in a manner dangerous to the public. Four witnesses gave evidence that the defendant was travelling at a very fast speed along the road from Penrith to Carlisle on December 5th. At Milestone House the wrong turning was taken, and in a few seconds the car was travelling down a steep hill at a terrific speed and seemingly got beyond control. At the bottom of the hill the car dashed into a cart containing a ton of coals, horse, cart, and driver being thrown into the dyke, and both cart and car badly damaged. The defendant's explanation was that the car was a new one, and inadvertently he had put his foot on the accelerator pedal instead of on to the brake, with the result that the car rushed down the hill, and it was a miracle the occupants of the vehicle were not killed. A fine of £10 and costs was imposed.

NOT SOUNDING APPROACH.

Before the Towcester Divisional Petty Sessions George Wright, chauffeur to Mrs. Singer, Coundon Court, near Coventry, was summoned for driving to the common danger at Towcester on November 21st. The offence was denied by Mr. W. Y. Groves for the defence. Inspector Slaughter said the car was driven past the cross roads at Northampton turn at between twenty-five and thirty miles an hour. The hooter was not sounded, and having regard to the traffic the pace was dangerous. Wright deposed that he left the Hotel Cecil, London, at 10.30 in the morning. On entering Towcester he slowed down, and then, having observed the danger signal, he went by the turn at about fifteen miles an hour only. He admitted not blowing the horn, but said his attention was concentrated upon keeping the car under control. Fined £5 with 16s. 6d. costs. The chairman said the reason for that penalty was that defendant did not sound the horn.

BATCHES.

At Highgate seven motorists have just been fined sums ranging from 20s. to £10 and costs. Caught in the trap between Cuckfield and Clayton four motorists have been summoned to the Haywards Heath bench, fines of £3 being imposed in all cases save one, where £7 10s. was the amount.

CLUBS AND ASSOCIATIONS.

R.A.C.

DURING the week preceding Christmas the Engineers' Department examined a score of motor-cars, furnishing a written report in each case. They also settled two disputes which, if taken into court, would have involved considerable expense.

Requisite notice not having been given by the Guernsey Motor Association to the Motor Union of the termination of their affiliation with that body, the Guernsey Motor Association has had to postpone affiliation with the R.A.C. for a year. The West Surrey A.C. has resolved to associate with the Club forthwith.

MOTOR UNION.

THE Chorlton-cum-Hardy Ratepayers' Association has passed a resolution of thanks to the Motor Union for supplying the three danger signs which have been fixed in Chorlton-cum-Hardy.

The committee of the West Herts centre of the M.U. consists of the following gentlemen:—Messrs. H. Arnold, M. Arnold, Dr. Fisher, F. D. Hindley, R. H. Harrison, H. G. Harper, W. E. Newcombe, Dr. A. L. Reid, T. Williams, and the Rev. A. W. Wilson, with Mr. Charles McWhirter as chairman and Mr. A. C. Bourner, Hilandale, Bushey Heath, hon. secretary.

LANCASHIRE.

At the last meeting of the committee of the Lancashire A.C. it was reported that a provisional arrangement had been arrived at with the Manchester A.C. for the demarcation of their respective spheres of influence.

COMMERCIAL MOTOR USERS' ASSOCIATION.

At the last meeting of the Executive Committee of this association Mr. Horace Bell, of the London General Motor Omnibus Company, Mr. R. S. Tilling, of the London Omnibus Owners' Association, and Capt. Dum-bell, of the London Motor Omnibus Association, were appointed to serve on the Standing Traffic Rules Committee. New members include Messrs. Rose Bros. (Gainsborough), Messrs. Brook and Frances (Huddersfield), Eccles and Pollock (Holsworthby), Imperial Flour Mills (Ellesmere), and Mr. William Rolles, of Romford.

SHEFFIELD.

ON Boxing Day the Sheffield and District A.C. met in Surrey Street, opposite the Town Hall, for a run to the Hop Pole at Ollerton. On the 1st inst. the members will foregather at the same point for a run to the Bell Hotel at Barnby Moor.

A postal vote of the members is to be taken as to whether the club will be associated with the R.A.C. or affiliated with the M.U.

AERONAUTICS.

At the last monthly meeting of the Royal Meteorological Society, Mr. Eric S. Bruce read a paper on "Some Forms of Scientific Kites," in which he brought to the notice of the society some forms of scientific kites other than the well-known box-kite invented by Mr. Hargrave. This is heavier and more breakable than many other forms of kites, but it possesses the indisputable advantages of stability, ascending steeply and exerting great force. When there is wind enough to fly it, it would appear unsurpassed. It is, however, considered advisable that meteorological kite ascents should be carried out as continuously as is possible, and that as many as possible of those days when the heavier box-kite will not rise should be utilised for obtaining information. On this account Mr. Bruce considers that lighter forms of kites, which are specially adapted for use in very light winds, would be of great service. He then described the Brogden six-winged bird-kite, the Salmon eighteen-winged kite, the Barclay honey-combed kite, the Cody bat-winged box-kite, the Balston butterfly-kite, and the Burgoyne aluminium kite.

"POLICE CONTROLS."

THE police have a measured distance at Hillmorton, near Rugby.

THE police trap in Shen Road, Richmond, has been frequently in operation of late. It is a furlong in length.

A TRAP three miles in length on the Great North Road has been established at Long Bennington and is in frequent operation.

AT Brampton, near Huntingdon, the police have lately been displaying considerable activity against motorists.

POLICE activity in watching motorists has been reported from Brighton of late, particularly on the Madeira Road and on the Old Steine.

AT Sendhurst Bridge, near Ripley, the police have a measured distance in frequent operation.

FROM the Fischer's Ball and Bearing Company, Ltd., of Hineley Street, Birmingham, comes a catalogue of their ball bearings and thrust washers. Their ball bearings are well known, and their specially light Journal Ball Bearings are being adopted for magnetos and other purposes.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

RILEY CYCLE COMPANY.—The directors' report presented at the meeting at Coventry on December 30th stated that the company had suffered owing to the severe depression in trade, which has seriously affected the cycle department. The tri-car branch, in which large preparations for output had been made, proved unsatisfactory, sales having decreased considerably, and a loss thereon resulted in consequence. The demand for cars had been very well maintained, and if quicker deliveries of the larger type of car had been possible during the early months of the season the trading results would have been different. The business done at the recent show was well in excess of that of the previous year. The balance-sheet showed that there was a loss for the year ended September last of £1,148 10s. 10d.

HUMBER, LTD.—The directors of Humber, Ltd., for the year ended August 31st, 1908, report a loss on trading of £23,082. Whilst in the early part of the financial year the trade was quite satisfactory and the contracts obtained for cars in excess of those for the same period of the previous year, the business done in the car branch in the spring and summer months fell off considerably, a large proportion of those contracted for not being taken. Steps were taken to reduce the establishment charges immediately on its becoming known that a reduction in the sales would occur. This served to minimise the loss, but as the reductions were made late in the season their full effect is not shown in these accounts. The concentration of the manufacturing at Coventry will, it is confidently believed, lead to considerable economies in production. Efforts are now being made to dispose of the company's freehold works at Beeston and those in Lower Ford Street, Coventry, but the depression in the local industries makes this, at present, a difficult task. To meet the public demand, the company is now producing a small two-cylinder car, which

Some well-known Motorists in the Clement-Bayard Airship. The accompanying illustration depicts the Earl of Shrewsbury and Talbot (in the centre), Mr. Frank Shorland and M. Clement on the bridge of the Clement-Bayard Airship.

has met with much approval. It is proposed that a new company (with the same board of directors) be registered with a capital of 550,000 shares of £1 each, of which 250,000 shall be preference shares entitled to a cumulative preferential dividend at the rate of 8 per cent. per annum, running for dividend from January 31st, 1909, and entitled to preferential repayment of capital, and the remainder shall be ordinary shares. It is then proposed to sell to the new company the whole of the assets of Humber, Ltd., subject to the liabilities thereof. The members to be entitled, within twenty-one days of the date of the agreement being accepted, to claim one preference share of the new company credited with 13s. 4d. paid up thereon for each fully-paid preference share of the old company, and one ordinary share of the new company credited with 15s. paid up thereon for each fully-paid ordinary share of the old company. The balance of 6s. 8d. on each preference share and 5s. on each ordinary to be payable as to one moiety on the shares being claimed and the other moiety on March 31st, 1909.

THE Motorists' Protection Association, Ltd., has been registered with a capital of £1,000 in £1 shares.

LONDON ELECTROBUS COMPANY.—The second annual general meeting of the London Electrobus Company was held on Monday at the Hotel Cecil, London. Sir Henry E. Dering, Bart., who presided, said the figures for the last three months showed that their 'buses were running at a very satisfactory operating profit, and indicated that it only needed to put more of them on the streets to earn good net profits. The horse 'bus must gradually disappear and give place to the mechanically-driven omnibuses, and, without being in the least unkind, he (the chairman) thought they must say that the steam and petrol 'buses were not a success, either as 'buses or financially.

THE MERCEDES BROUGHAM AND LANDAULETTE COMPANY (LTD.), has been registered with a capital of £100 in £1 shares.

THE METROPOLITAN (CHENARD-WALCKER) CAB COMPANY (LTD.), has just been registered with a capital of £3,500 in 1s. shares (60,000 pref. ord. and 10,000 def.).

LORD GRIMTHORPE (chairman), presiding at the second annual meeting of the F.I.A.T. Motor Cab Company at the Midland Hotel, London, said considerable delay had been experienced in the delivery of cab chassis, but these had recently been coming forward satisfactorily. When the report was issued the company had 180 cabs on the streets, and now about 200 vehicles were running. The dispute which the company had had with the maintenance contractors happily had now been settled, but it involved the loss of revenue from forty cabs for a period of four months. This, in addition to the delay he had spoken of, the instruction of drivers, and the work of organisation naturally affected the company's accounts, but their cabs were now running efficiently, and the average revenue was in excess of that estimated when the company was formed. They had also some private 15 to 20-h.p. landaulets for hire, and these were already a popular feature. Without being unduly optimistic, the directors were distinctly sanguine as to the company's future, and they believed the concern was going to be very successful in its operations. The report and accounts were passed unanimously.

BELSIZE MOTOR CAR COMPANY.—At the annual meeting of the Belsize Motor Car and Engineering Company on the 22nd ult. at the Midland Hotel, Manchester, Mr. E. P. Dawson, who presided, announced that the gross profit was £77,584, subject, however, to debenture interest and depreciation amounting to £8,219, leaving a net loss on the eighteen months of £634. The balance brought forward from last year amounted to £9,810 18s. less dividend, directors' and auditors' fees £4,616, leaving a total of £5,194. With regard to future prospects, the directors felt that the coming season would bring to them its share of the trade. They had orders for upwards of two hundred cabs and commercial vehicles, in addition to those they had already put on the London streets, which by the end of the month would be upwards of fifty.

ROAD REPORTS.

LINLITHGOW.—Figures having a bearing upon the increase of motor traffic upon roads in Scotland were given in a report presented at the last meeting of the Linlithgow County Council by Mr. Ramsay, highway surveyor. During the three years, 1903-6, the years prior to the advent of certain motor-bus traffic, the average quantity of metal applied to the 2½-mile section with which the report deals was 600 tons per annum. In 1906-7 the figures rose to 856, while last year it reached a total of 1,950 tons. For the current year a still increased quantity will be required. As regards cost, the maintenance upon which was formerly expended some £135 per mile has now reached the approximate figure of £450.

NOTTINGHAM.—Mr. E. P. Hooley, the County Surveyor, states that the road between Workson and Mansfield is dangerous at night in the parish of Warsop through drainage operations. These repairs are expected to last some time. The road between Mansfield and Arnold (Nottingham) will be unsuitable for motor traffic for some weeks.

LONDON.—It is intended to lay a tramway track along the Regent's Park Road, London, and we understand the work will shortly be begun, when the avoidance of the road by motorists will be advisable in their own interest.

AUTOMOBILE ACCIDENTS.

At an inquest held at Wellingore Hall, on Saturday, concerning the death of Mrs. Neville, the victim of a motor-car accident which occurred on Christmas Eve near Lincoln, a verdict of "Accidental death" was returned, the jury finding that no one was to blame. The car, which was being driven by Miss Neville, was turning a corner when it ran into one of the shaft horses of a team of three, and turned a complete somersault. Mrs. Neville was pinned down with the car across her body for twenty minutes.

FOUND lying on the roadside at Deeping St. James's, Lincolnshire, suffering from severe injuries to the spine, a man named William Tibbett has explained that he had been run over by a motor-car. He added that the occupants of the car pulled up after the accident, carried him to the side of the road, and then left him. The man, whose condition is serious, alleges that he spent the whole of one night on the roadside before being discovered.

MOTOR CYCLE RECORD.

At the Canning Town track, on the 22nd ult., O. C. Godfrey on a 5-h.p. Rex motor-cycle covered 268 miles 285 yards in six hours, beating the previous record of 244 miles 1,650 yards by H. Martin as well as all records from 101 to 268 miles.

In the form of a Christmas booklet we have received from the London and Parisian Motor Company, Ltd., of Davies Street, W., a series of testimonials from satisfied users of Hotchkiss cars, for which the firm are the British agents. Judging from the letters, these vehicles are giving very good service to their owners, and are steadily increasing their popularity in motoring circles.

FORTHCOMING EVENTS.

JANUARY, 1909.

- 7th (Th.).—Annual Dinner of the Yorkshire A.C. at Leeds.
- 8th (F.).—Annual Dinner of the Nottinghamshire A.C. Mr. C. Y. Knight will lecture on his engine to the Manchester and District Motor Trades Association.
- 12th (Tu.).—Extraordinary General Meeting of the Automobile Association.
- 14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
- 16th-25th.—Brussels Motor Show.
- 21st (Th.).—Annual General Meeting of the Southern Motor Club.
- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
- 23rd (S.).—Annual Dinner of the Coventry Motor Club at the Craven Arms Hotel, Coventry.
- Annual Dinner of the Lancashire A.C. at the Park Hotel, Preston.
- 26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

- 2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.R.H. Prince Francis of Teck will be among the guests.
- 4th (Th.).—Annual Dinner of the Southern Motor Club.
- 19th-27th.—Manchester Motor Show at Belle Vue.
- 24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
- Motor-Car Show at Barcelona.
- 20th-27th.—Cordingley's 14th Annual Motor-Car Exhibition and Market, Agricultural Hall, London.

MAY.

- 14th (F.).—British Motor Boat Club meeting at Erith.

JUNE.

- 14th (M.).—Commencement of the Scottish Reliability Trial.

BUSINESS NEWS.

THOSE interested in the question of front wheel brakes, more especially if they contemplate fitting such to an existing car, should make a point of getting the new catalogue of the E. M. Bowden's Patents Syndicate, which deals fully with this phase of the question.

MESSRS. DUCROS MERCEDES, LTD., have just had the honour of receiving the Royal Warrant of Appointment to King Edward as purveyors of motor-cars. His Majesty has at the present time in use 40-45-h.p. 1905 type and 45-h.p. lat. st 1908 type Mercedes cars.

MESSRS. WHITE AND POPPE, LTD., of Foleshill, Coventry, inform us that they have arranged to transfer their agency for London and the South from Messrs. Burgess and Harvey, Ltd., of Oxford Street, W., to Mr. W. H. M. Burgess, of 40, Glas-house Street, Piccadilly Circus, London, W. The new arrangement takes effect as from January 1st, and we are asked to call attention to the address at which W. and P. specialities will be exhibited in future.

THE Gracile Motor Car Company inform us that that company purchased the whole of the assets and goodwill of the Gracile Motor Car Company, Ltd., and have since December, 1907, been trading at 52, Regent Street, London, W., as the Gracile Motor Car Company.

THE authorities of the Borough of Kensington having renumbered Ladbroke Road, Notting Hill, London, W., (the address of the Mass Car Depot will now be 99, Ladbroke Road.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

THE Motor-Car Journal.

[VOL. X.]

LONDON, SATURDAY, JANUARY 9, 1909.

[No. 514.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

PRIZE COMPETITION.

AS recently announced, we are offering a prize of two guineas for the best original short story of motoring interest suitable for publication in the *M.C.J.* The story should be between 1,000 and 1,200 words in length, and the main incident should, of course, centre about the automobile.

The latest date for submitting the MSS. will be the first post on Saturday, January 16th, 1909, and the award will be notified as soon as possible after that date, the Editor's decision being final.

With reference to the stories which do not win the prize, the right is reserved to publish any which we may deem suitable, making payment at our usual rate of remuneration.

All MSS. should be forwarded addressed to the Editor, *M.C.J.*, 27-33, Charing Cross Road, London, W.C., the envelopes being marked "Short Story" on the top left-hand corner.

COMMENTS.

AS will have been observed by regular readers, the *M.C.J.* has, from the first, chronicled the development of aeronautics; its series of articles on "Mechanical Flight" in 1902 was a substantial contribution to the literature of the subject, and subsequent articles have kept our readers informed of the progress of aviation. The Cordingley Motor Show of 1907 afforded the first real effort in this country to demonstrate the fact that serious study was being given to the matter—an occasion which enabled us to become even more closely associated with the movement. Latterly our Paris correspondent has kept our readers *au fait* with the men and methods engaged in aerial navigation in France; in other columns the doings of inventors elsewhere have been recorded. We were waiting for an important development to take place in the British aeronautical world to draw the special attention of readers to the considerable space we are devoting to the possibilities of travel by dirigible machines above the earth. This comes in the special meeting of the Fédération Aéronautique Internationale, which will be held in London on Monday next, when the rules to govern the various international competitions for heavier-than-air machines will be formulated and settled, and the appeal of the Aero Club of the United Kingdom against the decision of the Berlin Aero Club in not awarding the first prize in the recent Gordon Bennett balloon race to the English balloon Banshee will be heard. The latter point is particularly interesting, for, should the decision of the Berlin Club be reversed, this year's contest will take place in Great Britain.

Cars v. Trams.

of law on the subject. Much depends upon the actual circumstances of the moment. In some places passengers alighting leave so little room between the tram and the pavement that to attempt to pass on the near side would be to hazard a murder; but to go on the

off-side might involve suicide to the motorist and injury to others. To suggest, as did the Brentford J.P., by his warning to the defendant, that motorists should pass on the off-side shows little regard for the conditions of traffic. The driver of a car by crossing to the off-side would certainly be risking much. The circumstances of the moment must be considered by the person driving; and passengers on trams should not leave while such vehicles are in motion.

Technical Instruction.

EVIDENCE of the practical nature of much of the automobile instruction that is now being given throughout the country comes in the appointment of Mr. William Morgan, B.Sc., to the newly-established chair of motor-car engineering in the University of Bristol. This appointment has been made by the governors of the Merchant Venturers' Technical College, in which it is proposed that the work of the Faculty of Engineering at the new University will be carried on. Mr. Morgan is a member of the Institution of Automobile Engineers, and is the manager of the Pupils' Department of the Daimler Motor Company. We understand he will continue his connection with this concern, spending part of each week in Coventry. Already he is engaged in preparing designs for the equipment of the motor-car engineering department at Bristol, and this association of the professorial element with the actual work of the engineering shop is a matter of considerable promise for the future success of this new department in one of the latest Universities.

In the Snow.

Now that the snow has disappeared official experiences with regard to the value of the motor-car in postal work are forthcoming. The recent storm had little effect upon London's mail service. Inquiries at Mount Pleasant have elicited the information that a conspicuous feature was the success of the motor service. The blizzard was the first serious touch of wintry weather since motor vehicles superseded the horse coaches, and the result proved beyond doubt the superiority of the new system over the old. Almost without exception they ran nearly up to correct time, the only coach which did not start being that from Brighton. It was in that instance found impossible to make the journey to London owing to the heavy snowdrifts.

Motor Cars and Property.

ONE of the great pleas urged against motoring in the early days was the depreciatory influence it would have upon house property in the centre of great towns. Many times in the first three volumes of the *M.C.J.* we urged that such a tendency would at most be only of a transitory character, and that matters would right themselves ere long. This view receives endorsement in a letter by Mr. Lionel Brown, a member of one of the best known West End of London house and estate agents, who mentions that "it was thought with the advent of the motor-car there would be a great depreciation in the value of London houses, on the ground that entertaining would be more largely carried on in the country with the means of transit so greatly improved. This view," continues the authority already mentioned, "for a time

was substantiated, but it has now been clearly shown that the threatened danger was but a passing one," and the past year was remarkable for renewed activity in the market for Mayfair and West End houses generally. As a matter of fact the greater mobility of the people made possible by the adoption of the motor-car has been a boon to the house and estate market.

Income Tax.

AN interesting suggestion has been made with regard to the motor vehicles owned by medical men and used by them in the course of their professional visits, viz., that a deduction should be made in the Income Tax assessment for the depreciation of the car. So far there has been no authoritative ruling on this particular point, and in the absence of such the Motor Union recently advised a member to apply for the deduction of one-sixth of the original cost. In filling in his Income Tax returns this has been allowed by the Surveyor of Taxes, and should be duly noted and acted upon by our readers in the medical profession.

The Danger of High Hedges.

Reference has frequently been made in the *M.C.J.* to the risk of accident owing to high hedges at bad turnings. When out on a 15-h.p. Clement-Talbot recently we came across a particularly bad spot at Arkley, between Elstree and Barnet. As the place is approached there merely seems a slight bend in the road ahead, and it is with some surprise that one finds this to be almost a right angle turn.

The Night Trappers.

At the Epsom Police Court, on Monday, the police explained to the magistrates their system of timing motor-cars in the dark, the signalling from one constable to another being by means of an electric torch. This is a Christmas innovation in this part of Surrey, and it was explained that considerable experiments had been made before it was finally decided to adopt the device for the timing of motorists. In one case a defendant said that he did not see the flash of the electric torch, and he should say it would be impossible for it to have been used without his seeing it. On his behalf a solicitor pointed out that the system of timing was a very crude one, and drew attention to the fact that between the times registered by the two constables concerned there was a difference of three-fifths of a second. This, however, did not avail with the Bench, who finally fined the defendant £5. Another instance in which a motorist was summoned for exactly the same offence in the daytime was dealt with, and a fine of £3 only inflicted. Should this system of timing by night develop it will add another terror to motorists, and so far as Surrey is concerned tend to give point to the suggestion of an Epsom correspondent,

Mr. J. Crow, who suggests that motorists should avoid Surrey post offices when taking out their Inland Revenue licences for 1909.

An Australian Club.

VERY satisfactory is the progress of automobile organisation in the colonies, and the history of the A.C. of South Australia is typical of that of several other Australian associations of motorists. This began in September, 1903, with Sir George Le Hunte as patron—a position he has retained ever since. In the following year the first motor race meeting was held in South Australia, but was scarcely a success, only a 15-h.p. Darracq car showing to anything like advantage. Early in 1905 a reliability trial was organised, and then in 1906 the club found it necessary to watch the Legislature with a view of protecting the interests of motorists generally. Deputations to the law officers were a factor in securing a more reasonable Motor Car Act than was originally intended, with the result that motorists, perceiving the benefits of association, joined the club in considerable numbers. Then came a period of study of problems associated with the road, the end of which was the recommendation of the system of diagonal scarfing in connection with repairs—a plan now universally carried out in South Australia. Apparently the motorists of the colonies are engaged upon much the same class of troubles as those in the old country, for we learn by the last mail that an agitation is being raised with regard to the placing of danger signals at the open railway crossings in the neighbourhood of Adelaide.

Good Work in Dublin.

THE Corporation of Dublin have been considering a report from their Paving Committee on the question of motor traffic, to the observance of which they have been incited by the circular recently issued by the Local Government Board. It is satisfactory to find that the committee have come to the conclusion that motor traffic in the city is conducted with the minimum of risk to public safety. This is evidence of the impartial nature of the observations of the members of this public body. They also show an enlightened view with regard to the duty of the Corporation as to dealing with the dust nuisance. Several macadamised streets in Dublin have been treated with a preparation of tar oil, and this is a policy that is recommended, if the Irish city is anxious to keep well abreast of the times and somewhat in front of many English towns of importance.

A Heavy Fine.

NOT often does such a case occur as that which has just happened at the Shoreham Petty Sessions, when the owner of a motor-car was commended by the Bench for attending the court and explaining that the chauffeur—who was summoned, resulting in the suspension of his licence—was driving faster than ordinarily by his orders. Thereupon the magistrates compromised the matter by taking off the suspension and increasing the fine from £20 to £30—an amount which the owner said he would pay.

Doctors and Speed.

TWO or three cases have lately been heard in the courts in which medical men motoring to the relief of the sick and suffering have been summoned for furious driving. Such instances are, of course, somewhat isolated, but are of sufficient importance to suggest that special treatment should be meted out on such occasions. The doctors summoned to the bedside of dying patients or called in cases of accident naturally proceed as rapidly as possible, and the suggestion of a Harley Street specialist that doctors who are satisfied that a patient's life depends upon their speed should be allowed to display a red cross as a badge on the car is interesting. This, he adds, should be recognised by the

police, and no embarrassment caused to the driver thus hurrying on his mission. The fire and the ambulance bell is familiar enough in the City of London; the red cross has equal reason for its advocacy in connection with errands of mercy such as we have mentioned.

Fire at a Kentish Mansion.

MUCH sympathy will be expressed with Mr. Huntley Walker in the loss he has sustained by the fire at Pickhurst Mead, Hayes, Kent, in the early hours of Monday morning. The mansion is an old-fashioned building which has been modernised so completely as to have, as an outbuilding, a well-designed and fitted motor house. At the time of the fire there were more than a dozen motor-cars in the building. The flames spread from the dwelling house to the garage, which was soon demolished and the contents burnt out. When daylight dawned what had been a motor house of galvanised iron was but a mass of blackened iron, the cars and their accessories being completely destroyed and twisted into all kinds of shapeless forms. Only a few gears and cylinders will be recoverable for service. One of the vehicles was the six-cylinder Darracq which Mr.

—are the great delinquents in disposing of it down the drain and in other situations of danger.

The Motorist's Diary.

LAST week we favourably reviewed the Motorists' Diary and Year Book for 1909—a little pocket volume of nearly four hundred pages, and containing much information with regard to the past year, as well as space for notes during the present twelve-month. This is now being supplied by Messrs. Cordingley and Co., from their list of books for motorists.

A Licence Point.

AMONG the statements made in the southern police-courts of late has been one to the effect that 70 per cent. of the motorists in the county of Sussex neglect to renew their licences at the proper time. This assertion was made at the Shoreham Petty Sessions last week in connection with one of those periodical hauls at Southwick which generally prove profitable to the county exchequer. It appears that the police, in

The Scene at Pickhurst Mead, the residence of Mr. Huntley Walker, at Hayes, Kent, after the fire. The debris of the cars that were destroyed is seen in the foreground.

Huntley Walker had driven on the track. There were also four Weigel cars (one of which had a special chariot body), a six-cylinder Napier, two 45-h.p. Mercedes, the two 90-h.p. Darracqs on which Mr. Walker established records at Brooklands, the 100-h.p. racer of 1907, and 24-32-h.p. and 10-12-h.p. Darracqs. Fortunately Mr. Walker's new 1909 Mercedes was away at Beckenham at the time of the fire. The trophies won by the well-known motorist were saved, and all the family escaped danger.

Petrol Dangers.

THE discussion now proceeding with regard to the dangers of petrol will serve to remind many people that the spirit which is doing so much to accelerate the progress of the world cannot be carelessly handled with impunity. As chairman of the Public Control Committee of the L.C.C. Mr. William Haydon has sent a letter to the Press which seems to absolve the motor industry from much of the blame which that department has hitherto heaped upon automobilists. Undoubtedly those who use the spirit in a domestic way—for cleaning garments, &c.

addition to testing the speed of motor-cars along the highway, also took a census of the licences, with the result that many were found slightly out of date, and others more so. In the area of the East Grinstead Petty Sessions, too, the same neglect to renew the licence has led to proceedings being taken, while the magistrates there have declared the action of the police in summoning motorists who travel without their licence to be fully justified—a subtle way of encouragement in such work. The point is a small one, but inattention to it may prove expensive. In connection with this, too, care should be taken by motorists who remove to acquaint the registering authorities with their change of address; the omission of such notification has proved expensive in many cases of late. In fact, it has been noticeable that, during the recent dull weather, when muddy roads have been the order of going, the police have been assiduous in stopping cars to ascertain whether the drivers have their licences about them. And when such is the case, inquiries with a view to the verification of addresses. &c., frequently follow.

WE hear that the recent frosty weather has played havoc with a large number of the engine cylinders of the taxicabs of one of the leading metropolitan motor-cab companies.

THE MOTORING OUTLOOK.

WHILE 1909 will probably attain most distinction in motoring annals in association with aerial flight, the steady progress of the motor vehicle on *terra firma* is likely to constitute a substantial contribution to mechanical advance. The sporting section of automobilism may deplore the absence of the Grand Prix contest of the A.C.F., and a minority may dislike the cautious attitude of the R.A.C. with regard to road racing in this country. But already in our columns British makers have declared they want no more 2,000 miles trials; and it is clear that the industry is settling down to a normal condition of things. Still, the year will not be uneventful. The War Office trials for light military tractors will attract attention in the spring, and then the summer season will see the Scottish Trials followed by the Irish event. Various minor contests are being undertaken by the R.A.C., and the appointment of Major Lindsay Lloyd to the management of the Brooklands Track is augury of developments at Weybridge which may prove of value to the technical side of the industry.

The new Clubhouse in Glasgow of the Scottish Automobile Club.

With regard to "the year that's a'wa'" gains have been made by the industry, but in the cases of some individual concerns the losses have been great. The profits and rewards of 1907 widened the circle of investors in the motor trade, and they scarcely expected such a sudden slump in fortune as has been chronicled by balance-sheets issued since the Olympia Show. A sense of uncertainty has prevailed, and it has been difficult to arrest the feeling of pessimism which has overshadowed that section of the trade concerned with the disposal of new cars; although the business that has been done in second-hand vehicles, and, in some cases, the surplus of the factories, proves that new owners are constantly being found.

In London motoring continues its popularity, and the year has seen the advance of the motor-cab, which is displacing the old-time hansoms and growlers, while the motor-'bus pursues its way with more silence and with greater acceptance than was the case two years ago. In the country the public service vehicle, with its seats rising in tier-by-tier-like fashion, has enabled tourists to speedily become acquainted with the beauties of the districts round about, and the provinces generally have awakened to the value of the automobile as against the trams for many localities. A notable instance of this was the decision of the

Manchester Corporation to licence motor-'buses—after an embittered and prolonged opposition. Several Yorkshire towns are seeking Parliamentary powers to run motor-'bus services, and Oldham and Salford will seek similar rights from Parliament in the coming session. In this connection mention may be made of the progress of the motor fire engine and the motor ambulance—the latest evidence of the development of the latter being the invitation for tenders for eight motor ambulances lately issued by the Metropolitan Asylums Board.

At a time of transition, when the sporting side of the industry seems to be in a by-path, as it were, the merest chronicle of recent events will suffice. Honours on the Continent were divided. The Mercedes won the Grand Prix, and the Prince Henry race went to the credit of the Benz, while in America the Fiat and Lancia cars gained distinction, and the former secured the American Grand Prize. In this country, apart from Brooklands, the run of Mr. Lee Guinness on his 200-h.p. Darracq on Saltburn Sands at a speed equivalent to 121.6 m.p.h. was really notable, as was the 66 m.p.h. run of the Siziare-Naudin voiturette in October. The "Four Inch" race was won by a new car of the year—the Hutton, the consistent running of the Daracq team in that event being a remarkable performance. Mention, too, must be made of the International Touring Car Trial, in which the class awards went to the following cars:—De Dion, Adler, Cadillac, Singer, Vauxhall, Talbot, Armstrong-Whitworth, Ariel, and Rolls-Royce.

Among motor organisations the Royal A.C. continues its progress, and has recently concluded agreements with the Transvaal A.C., and also the Automobile Club of Egypt, while the fact that during last year it examined 1,358 candidates for driving certificates is proof of the way in which it is appreciated. Of these 70 per cent. were successful. 620 certificated drivers' badges were issued, and 340 men were placed in situations through this department of the Club's activity. At the close of the year the association with the Motor Union came to an end, and it is to be hoped that the two organisations, which are now working on parallel lines in so many ways, will act in friendly consonance whenever the interests of the motor movement seem to require unity of action. The Automobile Association, too, continues its effective service on the roads, and the opening of a Paris dépôt testifies to the international character of its work.

An incident of more than ordinary concern in the programme of 1909 is the Conference in May next to consider the resolutions of the recent international gathering at Paris. This will doubtless be made the occasion for many diatribes against motor-cars in the public press; but motorists will welcome the serious deliberations of those who look at the road-way from the administrative point of view. These should suggest valuable improvements with regard to road construction and do something to educate public opinion in the direction of the National Road Department which Mr. Ballin Hinde so admirably advocated at the Paris Congress. From the social side of things 1909 should have pleasant associations, and both English and Welsh motorists will welcome the members of the Ligue Internationale Touristes, who will hold their annual meeting in London during July. This will recall many memories of the pioneer days with all their camaraderie and good fellowship. Thus the year will have its incidents and its value to the automobile world. There are many who look anxiously to the course that may be taken by Parliament with regard to legislation; this, however, beyond helping to promote unity among motorists in the presence of a common danger, is not likely to disturb the present legal position. The President of the Local Government Board holds the key of the political situation, and thus far he has shown himself to be a strong man not likely to be cajoled into harassing a growing industry by the blandishments of deputations from fellow M.P.'s and others susceptible to local influences. Motorists should seek to preserve the *status quo* rather than try to re-open the question. There is hope for the motorist, too, in the general Parliamentary programme, which is already so full that little time is likely to be assigned for the introduction of motoring matters into the Legislature during 1909.

The Great Lakes of Connaught.

BY J. LL. WARDEN PAGE.

TO my mind, Galway is not an interesting place. For a western town it is pretty large and, on market day, fairly lively, for then you will see, if you have luck, quite delightful Charles Leverish-looking old Irishmen and Irishwomen, but the rest of the week it is very dull. Ichabod is writ largely upon it. Its glory hath departed.

It was not always thus. Men say that in the past Galway had an important trade with France and Spain and a "prosperous mercantile community." The community does not strike the casual visitor as very prosperous nowadays, for decayed or decaying warehouses are far too common, while signs of activity about the harbour seem to be confined to one or two big ships and a fleet of fishing boats. Indeed, one wonders how the sixteen thousand odd inhabitants manage to pick up a living.

Nor, considering the size of the place, are there many objects of interest. The principal lion is the Lynch mansion, in the main street, a really fine mediæval house, enriched with sculptured stone window and corbel, one of the said sculptures representing a monkey holding a Lynch infant (which legend says it saved from fire!) in its arms. These Lynches were among the greatest of Galway merchant princes. One of them, James Lynch Fitzstephen, a sort of Irish Brutus, is specially commemorated by the Lynch Stone let into the churchyard wall. This gentleman, as warden, sat in judgment upon and condemned to death his own son, who had slain a Spaniard. Nay, more, he saw to his execution, for, a crowd having assembled to prevent the same, this stern father hung him from the prison window.

The church of St. Nicholas, close by this Lynch Stone, where Brutus and many a descendant lie interred, is worth looking into; and there is a certain quaintness about the Claddagh, a collection of thatched cabins down by the harbour, where the fisherfolk abide, and where they were once ruled by their own "king." Talking of fishing, if you want to consider salmon *en masse*, stroll on to New Bridge, and, if you have seen more salmon at one spot anywhere else, then you have seen more than I have. I have watched them lying three deep, and have counted over forty in a square yard.

This Corrib river, which flows right through Galway, comes out of the lough of the same name, a mighty sheet of water hard by Galway's gates. We will now proceed to see something of its shores. Unhappily the road thereto is none of the best. For eight miles, even into Moycullen, it is indeed abominable. But nobody is ever in a hurry in Ireland; we are on pleasure bent, why should we hasten? The river, a placid and navigable stream, lies on the right, with Menlough Castle, where the Blakes live, almost mirrored in its waters. Further on flat meadows spread out, and over them we presently catch a gleam of the lower end of the lake. Soon comes Moycullen and a better stretch of road running between the moorlands and the boulder-strewn flats that stretch away to the blue waters. Here and there is timber; here and there smaller lakes glimmer in the sunshine. It is all very pretty and peaceful. And so, seventeen miles from Galway, we come to Oughterard, a long-drawn-out village town where, if need arise, I counsel you to

stay with Mrs. Monaghan, who runs the post office and a little hotel which, if small, is cleaner than most in Ireland.

Oughterard is very nearly on Lough Corrib, which, indeed, seems the chief excuse for its existence. For the lake is becoming known among the sons of Zebedee for its fishing, and Oughterard is slowly expanding in the warmth of a prosperity induced by sport in its waters. Lough Corrib is got at easily enough by motor-car. Quite a good road winds along its western shore and affords splendid views over the lake and its many islands. But I hope you will not meet with such bad luck as did a friend of mine on this very road. As he wheeled merrily along one night there came unto him a cow of the moorland. Whether actuated by ferocity, curiosity, stupidity, or a little of all these I cannot tell, but that vile cow got her horns mixed up with the chassis. Result, a dead cow and a damaged motor-car. It cost my friend £30 in repairs, not to speak of £5 for the cow.

The scenery along the lakeside is, as I have hinted, delightful; but this, to my mind, is not the finest part of Lough Corrib, which will be found where the mountains close in at its northern end. To get there we "bout ship" (for this lakeside road ends in the wilderness), and, running back to Oughterard, pass over lake-studded moors to Maam Cross. And now Leckavrea heaves up ahead, his quartzite rocks glittering with points of light. Rounding his flank we drop down the long descent to Maam Bridge, hard by the north-western arm of Corrib. Here the surroundings are splendid. In front, overshadowed by Leckavrea and Carn Seefin, stretch the narrowing waters with the wooded hill of Doon pushing out from the northern shore, and, for background, the rugged line of the Mamturk mountains. On a rock islet rises Castle Kirke, once a

stronghold of the O'Flaherties. They were a strenuous race. I have read somewhere that the citizens of Galway did not forget them even in their prayers—"From the fury of the O'Flaherty good Lord deliver us." But this is suspiciously like the old supplication against the Norsemen—a *furor Normannorum libera nos, Domine!*

We take the road round the head of the lake to Cong. After descending the hill above Claggan—rather a nasty one—the road runs close to the shore. We look right down the great water. Were it not for the innumerable islands, I believe that by climbing the rising ground we should see most of its length, and that is thirty miles or more. To our left, but invisible, for Mount Gable shuts it out, is another great sheet, Lough Mask, and across the narrow strip of land separating it from Lough Corrib we find our way into Cong.

To the outside world Cong is only known for the "old person" (whoever he may have been) who figures in a well-known limerick. In reality, however, it is celebrated for other things—its cross, which stands in the village street, and its abbey, the ruins whereof fill a corner hard by in the demesne of Lord Ardilaun. This abbey, founded as long ago as the seventh century, is well worth a visit, for the pointed architecture is of great beauty. In the chancel of the abbey church is a tomb said locally to cover the remains of Roderick O'Connor, the last native

Cong Abbey.

[Miss M. Monaghan.

king of Ireland. But though he died at Cong, he was not, it seems, buried there. His bones lie at Clonmacnoise.

At Cong the subterranean river connecting Lough Mask with Lough Corrib comes to light, and there are all sorts of caves in the limestone, in one of which, Pigeon Hole, the mysterious river may be seen, though it must be confessed that in dry weather very little of it is manifest. Some years ago an attempt was made to unite the two lakes by means of a canal; but, like a good many other modern enterprises, the canal would not hold water. Like the river, the water disappeared in the limestone. And so the St. Patrick (the Galway steamer), and the big sailing boats, called *puckhauns*, which are the traders of Lough Corrib, stop short at the little quay at the river's mouth, right under the shadow of Lord Ardilaun's big mansion.

Lough Mask is only three miles from Cong, but it might be three hundred for all one can see of it. Neither is it so accessible as Lough Corrib. Still it may be "got at" here and there; and, perhaps, as good a view-point as any is the

other respects the road is uninteresting. Little of Lough Mask is seen, though the Partry mountains that rise over its further shores stand out prominently against the western sky.

The loftiest of these, Maamtrasna, looks down upon the broken walls of a cottage that in 1881 was the scene of one of the most horrible deeds that have marked with blood the history of Irish agitation. The man who then lived there was suspected of informing against "Moonlighters." Suspects in those days received short shrift, and one dark night masked men broke into the cabin and did him to death.

Except that it is the only town in these parts, Ballinrobe is of no interest to the traveller, and as for the way out of it it is simply abominable. The soil is the everlasting limestone, and limestone, as we all knew, has a habit of producing pits and hollows which, if not carefully tended, soon become objectionable. The inequalities of this, the main road to Castlebar, are not carefully tended, and for four or five miles progression resolves itself into a series of bumps. The merciful man who

Castle Burke (Lough Carra), co. Mayo.

road to Kilbride Bridge (which crosses an arm). It is off our route, certainly, but only about half a dozen miles, and the prospect from the ruins of Ross Abbey, near Clonbur—and, indeed, that from the bridge itself—is, perhaps, as fine as any on the lake. Another road passes up the side of the lake near the ruins of Lough Mask Castle and the remains of Inishmaine Abbey, which stand on an island close to the shore. Near this is the whilom residence of Captain Boycott, of famous memory—the man who added a now familiar word to the English language. But what this road is like I do not know, having myself followed the more direct route from Cong to Ballinrobe. This passes over the Plain of Moytura, on which, according to Irish annals, occurred that tremendous three days' battle between the native Firbolgs and the Tuatha de Danaans. As this "battle grim and great" took place twelve hundred years before Christ, one naturally expects a good deal of romance to be mixed with reality. Still, to this day, great cairns and other traces of the fight remain, the most prominent being an enormous tumulus near the village of Neale, which is said to contain or to cover an unknown number of the slain. In

regardeth the life of his motor will do well to go slow over this vile bit of road. And if he girdeth at the highway authorities of County Mayo, surely it will be forgiven him.

The road passes between Lough Mask and Lough Carra, and we get a view of both lakes, for at Keel Bridge we cross the channel connecting the two sheets of water, and note that the shallows of Lough Carra are quite milky with lime deposit. This little lake is worth a closer inspection than is afforded by the road. Parts of its shores are prettily wooded, and the ruins of Castle Carra and Castle Burke stand up boldly above its waters. For the rest, limestone crops up everywhere; every field seems to have its portion of boulder and rock, and the whole countryside presents an appearance bleak and stony that only disappears as we approach Castlebar.

(To be concluded.)

WE regret to learn of the death of Mr. George Singer, the chairman of the Singer Motor Company, which occurred on Monday at his residence, Coundon Court, near Coventry.

THE D.S.R. CAR.

ONE of the most novel cars exhibited at the recent Paris Salon was that known as the D.S.R., and shown by the Société d'Etude des Automobiles D.S.R. As will be seen from Fig. 2 the motor is of the four-cylinder air-cooled type, it is rated at 18-h.p., and has a bore of 62 mm. and the relatively long stroke of 112 mm. The main feature is the adoption of a single compound valve (Fig. 1) for both inlet and exhaust. As will be seen this is located in the cylinder head, and is actuated from the cam shaft through a vertical rod K and a combination overhead tappet E.F. The latter

Fig. 1.—Sectional Elevation of Cylinder Head of D.S.R. Car, showing the concentric inlet and exhaust valves. The first view shows the inlet valve open and in the second the engine is exhausting.

is connected with the stem C of the valve A. This is of a special form, one surface seating against the top of the combustion chamber and the other so arranged that when the engine is exhausting it rests on the movable seating B, so closing the inlet passage entirely. On the suction stroke the cam, giving a greater lift to the rod, causes the valve A to open further, and at the same time, through the tappet F, the movable seating B is pushed down to close the exhaust ports. It is claimed that as all the inrushing combustible mixture comes in contact with all parts of the valve and the movable seating, the exchange of temperature that ensues not only keeps the parts relatively cool, but is of advantage to the car-

Fig. 2.—Chassis of D.S.R. Car.

duration. The crank shaft is mounted on three bearings, the central one being of the ball type.

The next point of notice lies in the transmission, the usual clutch and gear-box being replaced by a special type of change-speed gear (Fig. 3) mounted on the back axle. The cardan shaft terminates in a bevel pinion P in mesh with two equal sized bevel wheels B and C. To the wheel B are secured the two satellites

pinions of a planetary or epicyclic gear, in mesh with an internally cut toothed ring fixed to the differential casing D and with a central pinion F. The latter is connected by means of the sleeve M with a cone K. The bevel wheel C is in one with a dished piece C, between which and the corresponding surface K are mounted four rollers G, the frictional contact being maintained by the spring R. The position of the rollers can be varied by means of a lever. When horizontal they roll between equal diameters of the dished piece C and the cone K. The centre pinion thus runs at the same speed as the satellites, and the whole planetary gear rotates with the differential, thus giving the top speed; to obtain a direct drive the rollers are brought slightly below the horizontal and are put entirely out of gear; at the same time the *bloc* formed by the cone K, the sleeve M, and the central pinion slide a little to the right, bringing the dog clutches FF into action and giving an absolute direct drive. Intermediary speeds are obtained by inclining the rollers G at an angle, the cone K thus being driven at a greater angular speed than C; the central pinion consequently runs faster than its satellites, imparting a retarding action to the latter which reduces the speed of the internally toothed wheel and of the differential. A further movement of the rollers brings them into such a position that the cone K is driven in the opposite direction to R, the reverse motion being in this way obtained.

The frame of the car is also somewhat novel; the front axle forms the forward crossmember of the frame, while at the rear there

Fig. 3.—Sectional Plan of Combined Change-Speed Gear and Back Axle on D.S.R. Car.

is no cross member whatever. The front axle, which is carried on a single transverse spring, also forms the support for the starting handle. A pair of vertically sliding pins, which also act as the stub axles, are mounted in sockets formed in the ends of the front axle. To the under part of the central portion of the axle is anchored the inverted transverse semi-elliptical spring, the ends of the latter being shackled to lugs at the base of the vertical sliding stub axles.

The steering pivots are of special design, and the cross rod is carried across the top of the frame behind the fan which takes the place of the usual radiator. The rear springs consist of halves of inverted semi-elliptics arranged somewhat on the lines adopted in the Lanchester cars. The back axle is of the floating type, and the cardan shaft is surrounded by a sleeve which is supported at four points and acts as a torque tube.

As will be seen, the whole design of the car is on extremely novel lines. Whether the same will, however, give good results in practice remains to be demonstrated.

IN the case of cars in which the water has been drawn off to prevent freezing in the winter season, it is well, when the time comes to fill up again, especially if the weather is still cold, to use warm water.

ACCORDING to an American motor trader who has recently returned from a brief trip to Cuba, the market for motor-cars of medium price may be expected to undergo a decided increase in that quarter within the next few months.

THE PIPE AERONAUTICAL ENGINE.

WE have already briefly referred to the new light petrol engine, specially designed for aeronautical purposes, exhibited at the recent Salon in Paris by the Pipe Company, of Brussels. This week we are able to publish drawings of the new air-cooled engine, which clearly show the construction. It will be seen that it comprises eight cylinders arranged in two sets of four in the form of a V. The bore and stroke are both

Fig. 1.—Sectional Elevation of Pipe 70-h.p. Aeronautical Engine.

A.—Vertical cooling ribs on cylinders. M.—Magneto.
B.—Connecting rods. N.—Air inducing fan.
C.—Carburettor. S.—Inlet and exhaust valves.
E.—Exhaust pipes. V.—Crank shaft.
F.—Cam shaft. tt'.—Valve tappet operating rods.
H.—Admission pipes.

100 mm., and at 1,500 revolutions per minute the engine is stated to give 70-h.p. The weight is 285 lbs., or about 4 lbs. per horse power. The crank case is of aluminium; the crank shaft is in one piece and is supported on three ball bearings; each of the four throws has two connecting rods attached to it. The inlet and exhaust are combined in one valve for each cylinder, the combination valve being located at an angle in the cylinder heads and arranged according to the compression of a double concentric valve. The cam shaft, which also runs on ball bearings, is located centrally at the apex of the V and carries two cams per cylinder,

Fig. 2.—Cross Sectional View of Pipe 70-h.p. Aeronautical Engine.

each operating the valves through separate push rods *tt'* and tappets, one of which opens the inlet and the other the exhaust.

The mixture is furnished by a single float-feed carburettor, from which branch four admission pipes—one for each pair of cylinders. A single high-tension magneto is provided for ignition purposes, the contact maker being so arranged that no two cylinders on one

side of the V fire at the same time. The engine, as already stated, is air-cooled; the cylinders are provided with vertical ribs *A* in place of the usual horizontal flanges; each group of four cylinders is enclosed in an aluminium jacket or cowl, through which a powerful current of air is drawn by an aspirator at one end. The aspirator is designed to draw in air at a greater rate than is necessary at the normal engine speed, so that the cooling shall be efficient even when the motor is running slowly. The inlet is at the bell-shaped base of the casing; the air is then drawn over the surface of the radiating flanges and round the cylinder heads and expelled through the aspirating fan on the rear end of the crankshaft. Other details of the motor, all adopted with the view of reducing the weight, include the adoption of steel pistons and nickel steel connecting rods.

MOTOR TERMS IN ESPERANTO.

DURING the course of the Industrial Vehicle and Aeronautical Exhibition in Paris, which came to a close on Wednesday last week, it was noticed that among the many thousands of visitors was a party of Esperantists in charge of a guide, who explained the different exhibits in the new International language. It is also recorded that at one stand the exhibitor was able to describe his aeroplane in Esperanto. In view of the growing interest in the Esperanto movement "Les Sports" has drawn up a short list of motor terms in French and Esperanto in the hope that it may prove of use to motoring tourists. We reproduce below the vocabulary published by our French contemporary, and in order to make it more complete have added the corresponding English terms.

| English. | French. | Esperanto. |
|-------------------------|-----------------------------------|---------------------|
| Accumulator. | Accumulateur. | Akumulatore. |
| Battery. | Batterie. | Baterio. |
| Brake band. | Ruban de frein. | Bremsorubando. |
| Breakdown. | Panne. | Panei. |
| Cam. | Came. | Kamo. |
| Carburettor. | Carburateur. | Karburatoro. |
| Chain tension rod. | Tendeur de chaîne. | Cengustigilo. |
| Chassis. | Châssis. | Casio. |
| Chauffeur. | Chauffeur. | Veturigisio. |
| Electric motor. | Moteur électrique. | Elektra motoro. |
| Exhaust. | Echappement. | Gasforfluo. |
| Exhaust box (silencer.) | Boîte d'échappement (silencieux.) | Silentibujo. |
| Exhaust valve. | Soupape d'échappement. | Forfluo valvo. |
| Fill. | Remplir. | Plenigi. |
| Garage. | Garage. | Remizo. |
| Gas. | Gaz. | Gaso. |
| Generator. | Générateur. | Generatoro. |
| Goggles. | Lunettes. | Okulvitroj. |
| Hill. | Côte. | Deklivo. |
| Horse-power. | Force en chevaux. | Cevalpovo. |
| Ignition. | Allumage. | Ignitigilo, ignito. |
| Leak. | Fuite (d'eau.) | Ellaso. |
| Lever. | Levier. | Levilo. |
| Motor (engine) | Moteur. | Motoro. |
| Motor-car (automobile.) | Automobile. | Automobilo. |
| Lamp. | Lampe d'automobile. | Lanterno. |
| Petrol (motor spirit.) | Essence. | Petrolo. |
| Reservoir. | Réservoir. | Rizervujo. |
| Spark. | Étincelle. | Sparko. |
| Sparkling plug. | Bougie. | Sparkilo. |
| Starting. | Mise en marche. | Ekiriga mekanismo. |
| Starting handle. | Levier de mise en marche. | Ekirigilo. |
| Steering wheel. | Volant. | Guidstango. |
| Tyre protector. | Protecteur de pneus. | Krom bendo. |

ACCORDING to a recent consular report, motor-cars have not so far been in much favour in Nova Scotia, mainly owing to the poor condition of the roads throughout the province. There has, however, been a decided effort to overcome this defect, a bill having been passed authorising the establishment of a Department of Roads, and a sum of £35,000 appropriated for the improvement of roads and £5,000 for small bridges. There are ninety-seven automobiles registered at the office of the Provincial Secretary, divided as to origin as follows:—United States, sixty-one; Canada, thirty-two; Great Britain, four.

AERONAUTICAL NOTES.

THE King of the Belgians' prize of £1,000 will be awarded this year to the author of the best work on aerial navigation.

THE Marquis de Mouzilly de St. Mars has, it is announced, placed an order for a Breguet aeroplane which is to be fitted with one of the Gobron eight cylinder (sixteen piston) aeronautical engines.

THE event of the past week in the aeronautical world has undoubtedly been the wonderful performance of Wilbur Wright with his aeroplane. Following a flight of sixty miles in 1 hr. 52 min. 40 sec. in extremely cold weather on Wednesday, the 30th ult., on the last day of the old year he started out to establish a new record, an attempt which was entirely successful, as he remained in the air for no less than 2 h. 20 min. 23 sec., during which time he covered an officially recorded distance of 77½ miles, notwithstanding that the thermometer stood at freezing point. Wilbur Wright thus secured the Michelin prize of £800 for the longest flight on a heavier-than air machine recorded in 1908, a replica of a fine piece of statuary called "The Triumph of Aviation," and the Triaca prize of £20.

THE following are the principal flights made by Wilbur Wright in France and the dates of the same:—August 8th, 1 min. 45 sec.; August 13th, 8 min.; Sept. 3rd, 10 min.; Sept. 5th, 19 min.; Sept. 16th, 39 min.; Sept. 21st, 1 hr. 31 min.; Oct. 6th (with passenger), 1 hr. 4 min.; Dec. 18th, 1 hr. 54 min.; Dec. 30th, 1 hr. 52 min.; Dec. 31st, 2 hrs. 20 min. In addition to the prizes mentioned above, the daring aviator has, since he went to France, won a number of others, including one of £200, another of £100, and one of £40, so that the past year has not been an unfruitful one for him from a financial point of view.

A NEW addition to the long list of aeroplanes with which experiments are being made in France is the Bonnet-Labranche aeroplane. The machine consists of an upper surface 7 metres long and 10 metres wide in front, tapering to 4 metres behind. There is a double box below the stem; two side wings are below the front, and a vertical rudder is located forward of the seat. This rudder is, however, only used in emergencies, vertical steering being done ordinarily by means of a small propeller in front whose shaft can be turned up or down. The driving propeller is behind the driver's seat, and is driven by a 70-h.p. motor. The machine is intended to carry two persons, and is stated to have shown great stability and rigidity.

M. DUFAYEL has placed at the disposal of the French Automobile Club, who are charged with the organisation of the event, a sum of £800 to constitute four prizes in an aeroplane race from Bagatelle (the Bois de Boulogne, Paris) to Sainte-Adresse. The event is to take place on July 18th next, and it is specified that the journey must be finished on that day. The prize money is to be divided in such a way that the actual winner will receive £400, the second to arrive £200, the third £120, and the fourth £80.

THE French Minister of War has just asked for specifications for an aerial cruiser to fulfil the following conditions as to speed, capacity, &c. A speed of thirty-one and a quarter miles an hour is required for a period of fifteen hours, with six passengers of average weight of 11½ stone each. Navigation also is to be possible up to an altitude of 6,560 ft. The maximum total volume of the cruiser is to be 6,500 cubic metres, and the total length 295 ft. During trial trips the aerial cruiser must accomplish a minimum circuit of 312 miles against a wind of 23 ft. per second within the space of fifteen hours, the circuit to be made without landing, and at least two-thirds of the voyage to be made at an altitude of over 4,260 ft. A bonus of £200 will be awarded to the designer of the plans of the cruiser, which will be classed No. 1, and smaller prizes, in proportion, will be given for the next best designs.

THE Automobile Club of Belgium has decided to interest itself in aeronautical matters, and has appointed a committee to deal with the subject.

AN anonymous donor has, through Count de la Vaulx, given another prize of £400 to the Aero Club of France for the encouragement of aviation.

THE first annual dinner of the Aeroplane Club will be held at the Savoy Hotel, London, on Wednesday next. Cinematograph pictures will be exhibited and a discussion will follow the dinner. The club has already reached a membership of 870.

THE Rhenish Westphalian Airship Company is the name of a new concern which has just been formed in Elberfeld, Germany, with a capital of £5,000. The object of the undertaking is to construct a new airship which will be 180 ft. long, and have a capacity of 2,200 cubic metres; it will be fitted with a 50-70-h.p. engine, and will be able to carry six passengers.

NEW additions to the growing list of experimenters with aeroplanes are being made daily. It is announced from Chalons, France, that M. Pasquier, of Rheims, is about to carry out some trials with an aeroplane of the bi-plane type. The engine is of a special design, and, although developing 60-h.p., is stated to weigh only 88 lb., or under 1½ lb. per horse-power; this will be connected up to two propellers each 7 ft. 6 in. in diameter. At

Amiens Mr. Henri Robart is experimenting with an aeroplane having an area of 50 square metres and fitted with a 40-h.p. motor. At Sainte Cecile (Bouches du Rhone) M. Morgue is building an aeroplane in which the stability is maintained by means of a gyroscope. The apparatus, which is of the bi-plane type, will shortly be tested on the racecourse at Orange.

MR. WILBUR WRIGHT brought his stay at Le Mans to an end on Sunday last, when he began to make preparations for transferring his aeroplane to Pau. The machine, which was found to weigh 7 cwt. 38 lbs., was packed up, together with the starting appliances. Mr. Wright does not believe that during the present year aeroplanes will become sufficiently perfected to be of general utility, but as far as his own machine is concerned he is hopeful that when his new engines are ready he will be able to remain in the air for four or five hours, and to cover distances of from 200 to 300 kilometres. With regard to modifications of his system, he states that while for the present he proposes to preserve his starting and landing apparatus in its present form, he is engaged in devising a method of rising from the ground which would enable him to dispense therewith.

MR. ORVILLE WRIGHT, accompanied by his sister, sailed for France on Tuesday on board the Kaiser Wilhelm, in order to join his brother Wilbur in France.

WE hear that Mr. H. R. Pope, of the Itala Automobile Company, Ltd., has ordered two Wright aeroplanes, and that he will be shortly going to Pau, France, to receive a course of lessons in the handling of the machines from Mr. Wilbur Wright.

THE aeroplane "Silver Dart," constructed by the Aerial Experiment Association, recently made four successful flights at Hammondsport, N.Y., U.S.A. The association, at the head of which is Mr. Alexander Graham Bell, the inventor of the telephone, has constructed four aeroplanes to date, each being an improvement on its predecessor. The machine, which weighs complete with operator 850 lb., is fitted with a 50-h.p. engine. The propeller is driven by a V-belt, the same as in a motor-cycle.

MR. HOWARD WRIGHT's helicopter is now completed, and has been sent out to Italy. The tests of this flyer carried out in England have been eminently satisfactory. Mr. Wright is now building, for an English enthusiast, a large bi-plane, which he hopes to complete early in February. Both his workshops in High Street, Marylebone, and his larger premises at Battersea Park are now busily employed on machines which are being constructed to order.

A Poor Aeroplane Inventor at the Paris Show.

As was the case at the Agricultural Hall Exhibition a couple of years ago, among the exhibitors at the recent Salon in Paris of models of suggested flying machines, were several shown by poor inventors, one of whom is caricatured in the above sketch from the "Auto."

GOSSIP FROM PARIS.

The End of the A.C.F. Grand Prix Race.

The boycotters of the Grand Prix have carried the day. At the expiration of the delay on the eve of the New Year no one had added a single car to the list of entries published in the *M.C.J.* last week. Even the Marquis de Dion, who had taken the lead of those favourable to the maintenance of the international competition, confessed he had been beaten and consequently found it useless to inscribe his cars. The great official speed race is therefore suppressed at least for this year. "Will it ever be revived?" is a question which the most interested parties, that is to say, the automobile manufacturers, are loth to answer. Indeed, they themselves do not know. One of them, however, said to me on January 1st, "Thank goodness the Grand Prix is as dead as a door-nail." It may be so; but, as one of the leading motor car agents remarked with much truth, it will depend a good deal on the sale of French-made automobiles at home and especially abroad. He affirmed, "If the exports fall off considerably, as I fear they will, it would not be astonishing to see the very same men who were the chiefs of the boycotting campaign transformed into the most ardent champions of the great International race in 1910."

Touring in France.

At Pons, a little town in The Charente, on the direct road from Bordeaux to Paris, the great Route Nationale runs straight through the vaulted substructure of an old monastery.

The Champion Flyer of 1908.

Wilbur Wright has won the Michelin prize of £800 and the bronze reproduction of the annual cup. His performances on 30th and 31st December, executed in spite of the intense cold, were perhaps yet more remarkable than his previous flights and show he is incontestably worthy of the title of "King of the Air." On the first occasion he flew during 1 hour 26 minutes 10 seconds, covering a distance of about sixty miles, and on the second he remained in the air no less than 2 hours 20 minutes 44 seconds, flying an officially controlled distance of a trifle over seventy-seven miles. M. Barthou, Minister of Public Works, and the champion of aviation in the Cabinet and in the French Chamber and Senate, had gone from Paris to the Auvours camp on purpose to see the wonderful spectacle. It was the first time he had witnessed a flight, and it astounded him more than he had expected. I noticed he watched the aeroplane with intense interest while the aviator made it sometimes soar to an altitude of more than 100 yards and at others caused it to skim the ground before rising again to the height of twenty-five or thirty-five yards, which was maintained for the greater portion of the record flight. When the signal was given that the sun had set and that consequently it was useless for him to prolong the experiment Wilbur Wright brought his machine gracefully and softly to the ground close to the spot where M. Barthou was standing. In a few minutes the Minister had accepted Wilbur Wright's invitation to take a seat on the aeroplane. What his sentiments were when, after a few minutes' flight,

he set foot again on *terra firma* may be judged by his exclamation, "Yes, indeed M. Wright you have proved once more to-day that aviation has entered the phase of practical utility." On the same day Henry Farman and Moore-Brabazon at the Chalons camp were to have tried to beat the American aviator's record, but they both had difficulties with their motors, which refused to work properly. The consequence was that Henry Farman made three flights of only a few minutes' duration, while Moore-Brabazon failed to get his machine to leave the ground.

The Aeronautical Show.

The Salon de l'Aeronautique has closed its doors. It was a huge success at least in so far as the attendance of the public was concerned. Many tens of thousands of Parisians had witnessed the flights of aeroplanes at Issy-les-Moulineaux, and all the inhabitants of La Ville Lumière had at one time or another seen the steerable balloons navigating the air high above the loftiest monument of the city. But at the Grand Palais the people came to touch and to examine closely the mysterious machines which, till then, they had only seen from a distance. The dense crowds that collected round them during the whole time the show remained open demonstrated the extraordinary interest taken in them. If, however, the manufacturers did not profit by that circumstance to take large orders, it is pretty sure that the show will facilitate the floating of aviation companies. Whether that result is an advantage may be questioned. Of the aeroplanes which were exhibited only a very few had ever flown, and it may be taken for granted that most of them will never leave the ground. Nevertheless capital will doubtlessly be found to construct them for sale, because now every one's ambition is to have a flying machine. When it is at length discovered that 75 per cent. of them are built in such a fashion that they cannot possibly fly, it is to be feared that capital will begin to fight shy of even those aeronautical investments which promise success. That is one of the dangers threatening the new-born industry, and it is certain it has been increased by the phenomenal success of the Salon.

Paris under Snow—The Triumph of the Automobile.

"It's an ill wind which blows no one any good." The wind which blew the snow to Paris last week blew the horses off the streets in less than a couple of hours, but the motor-cars, private vehicles, taxi-cabs, and even the lumbering top-heavy buses proved themselves equal to the emergency. While the horse-omnibuses and cabs had to be taken home or left standing by the roadside till a few horses having been rough-shod were at last able to drag them to their respective depots, the motor-buses and cabs were rushing about without a moment's rest as if nothing unusual had happened. The petrol motors thus once more proved their superiority over the "moteurs à crottin." It was a veritable triumph for the new means of locomotion. Most of the taxi-cab drivers did not think much about that, but, applying the economic principle of supply and demand, raised their fares proportionately. To take a party home from the theatre the price charged was rarely under 20 francs, especially if the distance was at all considerable.

MARNEY.

FROM Washington, U.S.A., comes the report that the motor-car will be the official vehicle at the White House after March next, when two vehicles are to be placed at the service of the newly-elected president, Mr. Taft.

At the recent Paris Salon Messrs. Iglésis and Regner, of 32, Rue Reunequin, Paris, had on view an interesting little dynamo known as "La Magicienne," intended for lighting and ignition purposes, as well as for the mechanical starting of the petrol engines of motor-cars. The machine is arranged to be driven off the engine by suitable gearing; it is entirely self-regulating, and maintains the small battery of accumulators for lighting and ignition purposes in a fully-charged condition. To start the petrol engine, the dynamo is made to act as a motor, being supplied with current from the battery.

CONTINENTAL NOTES.

A Motor Sleigh Competition.

The Touring Club of France is organising a motor sleigh contest, which will take place at Monestier-de-Clermont (Isere) on the 24th inst. The sleighs will be submitted to different level-way and hillside experiments which will have the character of tests rather than of races.

La Coupe des Voiturettes.

The "Auto" is determined that the suppression of the Grand Prix shall not entail that of the race for light cars known as the Coupe des Voiturettes. As the A.C.F. refuses to organise it, that journal will undertake the task alone. The competition, which is to be International, deserves to succeed, as it will certainly stimulate manufacturers to improve the light cars which are in such demand at the present time. The "Auto," which has published the rules and regulations for the competition, is looking about for a suitable

that in the case of there being more than sixty entries elimination trials shall be held, leaving thirty cars to compete in the final race.

An Automobile Meeting at Cannes.

The Automobile Club of Cannes is organising a number of motor events for March next. On the 14th of the month there will be a series of speed trials over the flying kilometre, on the 15th a hill climbing competition, on the 16th a fuel consumption contest, and on the 17th a brake trial.

Miscellaneous Items.

The Pipe Company have lately supplied a motor vehicle with a collapsible escape ladder to the Brussels Fire Brigade.—A motor-car exhibition is to be held in Prague from April 11th to 18th next.—A company has just been formed in Breslau with the title Die Breslauer Electromobil-Transport-Unternehmen

The recent Military Manœuvres in Germany.—Some of the Motor Vehicles at Bingen.

[Allgemeine Automobil Zeitung.]

circuit, which cannot be that of Anjou because it is to be situated within 62 miles of Paris and not to measure more than 25 miles or less than 15 miles. It is proposed to hold a race of 500 kilometres (311 miles) in the month of June next. The minimum weight of the cars is fixed at 600 kilogrammes. Both detachable rims and wheels are to be allowed. For the single-cylinder motors the bore may vary between 100 mm. and 120 mm., and the stroke between 250 mm. and 124 mm. For the double-cylinder motors the bore may range between 80 mm. and 95 mm., and the stroke between 192 mm. and 95 mm. For the four-cylinder engines the bore may vary between 65 mm. and 75 mm., and the stroke between 140 mm. and 75 mm. The entrance fees are £20 for one, £32 for two, and £40 for three cars. Some people seem to think the undertaking not to participate in the Grand Prix with heavy cars will not preclude those who boycotted the great race from participating in the Coupe des Voiturettes. However that may be, the "Auto" counts on a large number of entries before the expiration of the last day for the inscription of cars, on May 31st next, as the regulations stipulate

Gesellschaft (Betu), to establish a parcel delivery system in that town by means of electrical vehicles.

Les Termes Usités par l'Aerostation et l'Aviation.

Plusieurs de nos lecteurs, dit "l'Echo de Paris," nous écrivent pour que nous leur donnions la définition exacte des termes usités par l'aerostation et l'aviation. Répondons à leur désir. Aérostat est le terme générique employé pour les ballons de toutes sortes. Aéronef est le mot appliqué aux ballons dirigeables, selon M. Julliot, l'ingénieur de la "Patrie" et de la "République." Aéroplane, machine volante plus lourde que l'air. Les aéroplanes se divisent en monoplans (le Blériot), biplans ou cellulaires (le Farman), triplans, et multiplans. Hélicoptère, machine volante dans laquelle la surface portante est remplacée par des hélices sustentatrices devant maintenir l'appareil dans l'air. Ornithoptère, machine volante possédant des ailes battantes. Aéroneute, pilote d'un ballon sphérique ou d'un dirigeable. Aviateur, celui qui monte et dirige un aéroplane ou un hélicoptère.

EMERGENCY REPAIRS AND SOME WINTER MOTORING HINTS.

THE writer's notes that appear from time to time under the first part of the above heading are usually written with the object of putting wrong right, but having regard to the time of the year and the havoc that frost may play in the parts of a motor-car, it may not be out of place to pause for a moment and view things from the opposite standpoint, and adopt the principle that prevention is better than cure. In a recent issue of the *M.C.J.* mention was made of a road repair between Moscow and St. Petersburg. The object of calling to mind such a reference is that, though temperatures are experienced in the places named that a Fahrenheit thermometer would not condescend to register, one fears the winter grip less there than in Great Britain, where such variations of the quicksilver are unknown, the reason being that in countries like Russia, Canada, &c., time is taken by the forelock.

Water, which neither man nor beast can dispense with, and in a normal state is harmless, under great heat or excessive cold expands, and when subjected to either stress may become both troublesome and dangerous. As an hydraulic power its resources are far and away superior to any other known force; as steam its elasticity and strength is amply demonstrated daily before us.

Motor-Cars and Hunting.

The above illustration depicts a deer hunting party in Colorado, who have found the automobile an excellent adjunct to their sport.

and has revolutionised the commerce of the world. When frozen there is hardly a vessel that can be made by man which will withstand the enormous strains of its expansion. A good illustration of this form of energy is seen in the fissures made by frozen water in rocks, &c. It is in this phase that it will specially appeal to motorists.

Some little time ago a number of guns were sold by a Government to be broken up. Every known means to burst them within the range of paying possibilities were tried by the purchasers, but without avail; another lot was sold, and profiting by the experiences of those who had gone before, the buyer, being resourceful, thought he would try fresh ground; he had holes drilled and filled with water, then plugged up with screwed steel plugs and waited for the fall of the quicksilver; the frost did the rest. The desire here is to show what measures can best be taken to prevent cracked castings and burst pipes. The first thing to bear in mind is that the damage, when it takes place, is done before the thaw sets in. Older motorists know this quite well, but there are thousands of individuals who seem to have formed the erroneous idea that when they see a leaking pipe it is then the damage is taking place. When anticipating the subject of this article to a lady motorist and explaining the foregoing

to her, she replied, "All I know is that I never see any leakages in the bath room pipes until the thaw comes." Of course not, "ice" does not leak.

Taking the car first when at rest, the danger zone of any part, whether radiator, pump and connections, water jacket, pipes or castings is at the lowest point, where there should always be a drain tap; if there is one it should be opened when the engine is warm, run out all the water, and the walls will become dried with the heat. If there is no such means of draining off the water, disconnect the part, if possible, and empty out all the liquid. A tap should be added at the lowest point as soon as possible. Wrapping in blankets before the engine is cold is a wise precaution. A friend of the writer's had a quaint way of preventing any part of his car being frozen during the cold weather. The last thing at night he would go out to the motor house, run the engine until it was really hot throughout, and always once in the night go through the same operation, but this *modus operandi* would not appeal to many.

With an air-cooled engine there is little to fear from "Jack Frost." To pass on to when the car is running, it should be kept in mind that the function of the radiator is to cool. This may be carried to extremes; to prevent this, it is well to put the fan out of action in very cold weather.

Many anti-freezing mixtures are on the market, some good, others of a doubtful nature, but two simple, harmless, and not expensive additions are recommended. Glycerine is a most efficient agency when used with an equal amount of water, but it is more costly than methylated spirits. The latter is quite as effective, but gives off a slight odour; 20 per cent., or one-fifth to four-fifths of water is sufficient. It is a very old preventive, and used by chemists for similar purposes, even before the advent of the steam engine. The relative cost of these two may be taken as follows:—Glycerine, being heavy, is sold by weight, but calculated by measure is approximately 10½d. per pint. Methylated spirit is 6d. per pint, so that as less than half the quantity of the latter is required, and little more than half the price, it is about a quarter the cost; it is also much cleaner than glycerine, and gives quite as good results. It seems almost superfluous to add that a slow combustion stove in the motor house meets the case, but an open fire is most undesirable unless all petrol has first been removed, both from car and house.

Referring to repairs, a useful one was recently performed by a chauffeur on a magneto-fibre wheel. Some teeth had become stripped and no new wheel was to be obtained locally. As time pressed, a piece was taken out of a discarded wheel, shaped dovetail fashion and fitted into the place prepared for it. This makes a good, sound repair. A curious trouble arose with the writer. The car had been sent to a local repair shop in his absence, and on returning to use the vehicle it was found that it did not run with its usual freedom. On noticing that some of the pipes had been disconnected and fresh joints made, he thought the trouble was possibly at one of these. On taking down one of the pipes it was found that in making the joints new packing had been used and the hole in the centre of the same was only about half the size of the interior of the pipe. The result may easily be guessed. How simple a thing, and yet what trouble may thus be caused! There is no doubt but what this is a rather common error, and occurs more often than is generally known.

E. T. H.

Two petrol fire engines of the "Hatfield" type are now being completed at Greenwich for the London fire service. They will be capable of pumping 450 gallons per minute.

A PAPER will be read by Mr. R. F. S. Bircham on the "Use of Small Internal Combustion Engines for Marine Work," at the Institution of Automobile Engineers, on Wednesday next.

MESSRS. C. A. VANDERVELL AND CO., the well-known makers of accumulators, electric lamps, magnetos, coils, &c., of Warple Way, Acton Vale, London, W., have sent us an excellent perpetual calendar, which will serve as a reminder of their well-known productions.

THE SOCIAL WHIRL.

THE King, the Prince of Wales, and several members of his Majesty's house party at Sandringham recently motored to the Frankfort Wood and spent the day among the pheasants.

HIS EXCELLENCY THE EARL OF ABERDEEN has, like his predecessor, the Earl of Dudley, shown great interest in motoring matters. His encouragement has not been limited to opening the official headquarters of the Irish A.C., but he has also endeavoured to promote the welfare of the industrial side of the movement as well. A few days ago the Earl had a run in the "All Irish" landaulet belonging to Mr. Justice Ross. This was so successful that he decided to visit the works where the car was made, and accordingly he took advantage of being in Belfast recently to inspect the establishment of Messrs. Chambers Motors, Ltd. A long tour of the works was made by His Excellency in company with the Lord Mayor of Belfast, Sir Robert Anderson, and among the finished cars seen were vehicles for Lord O'Neill and Mr. C. G. Macartney, D.L., J.P.

MR. HARVEY DU CROS, sen., will shortly be taking a short holiday on the Riviera. Now that his son sits for Hastings he will be able to enjoy a recuperative rest without having to return at the call of the Parliamentary Whip.

I HEAR that Mr. A. Craig, a director of the Maudslay Motor Company, Ltd., Coventry, had some exciting motoring experiences during the Christmas holidays, he being snowed up for three days in Scotland.

ON Friday of last week, at the Villa Villa Restaurant—well-known to the motor trade of the West End of London—the principals of Messrs. Max Graddon and Lawson, Ltd., entertained their staff to a New Year's dinner. In addition to welcoming 1909 the occasion served to inaugurate the new partnership, and Mr. T. B. Lawson from the chair spoke most hopefully of the future. The management will remain as before, and with Mr. A. H. Storey as the works manager the company should develop a high reputation for carriage work. Mr. Storey has been responsible for the production of some of the Royal carriages. Mr. Lawson is the chairman of the concern, Mr. Max Graddon the managing director, and Mr. D. Paterson the secretary.

THE snowfall of last week seriously interfered with many house parties which had been arranged in country districts. Train communication broke down in many places and even motor-cars had a bad time. I hear of one motorist who overcame his difficulty in a way that should be remembered by others for service should the snow return. He was going to a ball ten miles from his home and over very bad hills. His motor-car was sent on a trial trip in the afternoon and failed at the first hill. They then tied ropes on the wheels, and in addition carried a hundredweight of cinders. Twice the car refused to pull, and each time a few cinders sprinkled in front of the wheels enabled the vehicle to proceed.

AT the annual dinner of the firm of Messrs. Gould Bros., of Exeter, last week, Captain Bazalgette proposed the toast of the firm, and also made a presentation to Mr. Ernest Gould, the managing director, from the staff. In his reply the latter referred to the increase in the motor business of the city and to the several successful non-stop runs carried out by the firm during the past year. A presentation was also made to Mr. Harrison, an important member of the staff.

LOLLIUS.

THE New Zealand four days' Motor Car Reliability Trial concluded on Monday. The course was one of 547 miles, over rough country, steep hills, and rivers. No fewer than thirty-six competitors took part in the event, and on the highest aggregate marks for reliability, hill-climbing, and petrol consumption Talbot cars were placed first, second, and third—a good beginning for the New Year.

HERE AND THERE.

A DELAHAYE motor fire engine has been built for the fire brigade of St. Etienne, France.

A NEW branch of the Arrow Motor Works is being opened by Messrs. C. A. White and Co. at 426, Hoe Street, Walthamstow.

AT 1, Nassau Street, Dublin, Mr. Barrett has ample facilities for charging accumulators, and also keeps a stock of all electrical accessories likely to be required by owners of motor-cars.

THE work on Petrol Motor Car Mechanism and Management, by Mr. W. Poynter Adams, recently noticed in these columns, has been added to the list of books supplied by Messrs. Cordingley and Co. through the post.

MR. W. F. PARKER is the manager of the Oxford Motor Cab Company, Ltd., 68, St. Giles', Oxford, which has motor-cabs and carriages for hire. The tariff which the company have issued is well calculated to secure public appreciation of this automobile service.

THERE is a very marked tendency on the part of village blacksmiths in America to take up the business of motor-car repairing. A Chicago correspondent reports that he finds also that the signs carried by these artisans have undergone a change, "Garage and horseshoeing," being one such sign that he encountered in the course of a recent tour.

The "Kempshall Girl," reproduced from an illustration just issued by the Kempshall Tyre Company of Europe, Ltd.

MESSRS. FRISWELL are using the latest and most up-to-date appliances for the washing of motor carriages entering their premises in Albany Street, London, N.W. In view of the arduous work and indifferent results obtained by the use of water just above freezing-point, they have installed a patent geyser, which gives a plentiful supply of hot water through the ordinary washing hose, for the use of the washers in their establishment.

MESSRS. DENNIS BROS., LTD., have sent us a photograph of one of two vans they have just delivered to the order of Messrs. J. and P. Coats, of Paisley. The vehicle, which is equipped with a 35-h.p. engine, is fitted with a body of novel construction, insofar as the lower half of the sides is made so that it can be dropped down while the top portion is like a revolving shutter. We may add that the vans were supplied through Messrs. Rennie and Prosser, the Glasgow agents for Messrs. Dennis.

IN a Board of Trade and Foreign Office report on the trade of Bangkok for 1907, it is stated that Siam is one of the principal markets for motor-cars in the East, the number now in use in the capital being about 300. The great majority of these cars are owned by Siamese, and employed for pleasure purposes. The import shows no sign of slackening, and as long as it is the fashion to drive a motor-car, so long will the demand continue. The roads are being, and have been in the last few years, much improved, the improvement being almost entirely due to the advent of motors.

FEBRUARY 1st is the latest date for tendering for the eight motor ambulances required by the Metropolitan Asylums Board.

THE Star Engineering Company, of Wolverhampton, have just delivered a new motor-van to the Co-operative Wholesale Society, of Manchester.

MR. F. C. LITCHFIELD, of the St. Giles Cycle and Motor Engineering Works at Norwich, has opened another depot at St. Margaret's Plain, in that city.

MESSRS. STATHAM AND CO. have depots for the storage of petrol, oils, tyres, &c., in the High Street, Kilkenny, and will be pleased to render assistance to motorists passing through the town.

THE County Chemical Company, Ltd., have removed to their new premises in Bradford Street, Birmingham—the land previously occupied by their factories having been taken by the G.W.R. for a new station.

THE Isotta-Fraschini car, which was entered for the 1908 Vanderbilt cup by Mr. C. V. Brokaw, and which Herbert Lytle drove into second position, has been disqualified on account of its being in excess of the maximum weight of 2,644 lbs. The second place consequently falls to the Mercedes driven by Lutgen.

WE illustrate herewith the smart 14-20-h.p. Siddeley car just delivered to Mr. Tomyns R. Brown by the Connaught Motor and Carriage Company, Ltd., Long Acre, W.C. This is the first vehicle of the 1909 model to be delivered; it has a 9 ft. 3 in. wheel-base, the chassis being fitted with a Connaught Roi des Belges body, with double extension Cape cart hood and screen. The car has

special wings, and is fitted with luggage grid, head lamps, and Blériot Scout Horn. The body has a very striking and handsome appearance, being painted in turquoise blue and upholstered to match, with waterproof covers for bad weather. A noteworthy feature in connection with the vehicle is that the doors open the reverse of the usual way, thus providing ample room for getting in and out of the car, a feature which ladies will greatly appreciate.

ANOTHER Light Agricultural Motor Competition is to be held at Winnipeg, Canada, from the 7th to the 17th July next. Classes will be provided for machines of (A) 20 brake h.p. and under, (B) 21 to 30 brake h.p., (C) over 30 brake h.p., (D) 75 brake h.p. and under. All entries must be sent on or before June 1st, 1909, to Mr. A. W. Bell, general manager, Industrial Exhibition, Winnipeg, the entry fee being £1 per motor. No restriction will be placed on the nature of the fuel used or class of engine. It is to be understood, however, that the fuel shall be such as can be readily procured in Canada. The tests will comprise ploughing, hauling, belt-driving and a brake test. In considering the merits of the competing motors, special importance will be paid to the following points:—1. Weight of motor. 2. Brake horse power developed. 3. Fuel and water consumption. 4. Distance that can be travelled without replenishing. 5. Turning capabilities. 6. Protection of working parts from mud and dust. 7. Accessibility of all parts. 8. Travelling speeds. 9. Ease of manipulation. 10. Clearance of working parts from ground. 11. Steadiness of running for belt power. 12. Selling price. 13. Design and construction of engine.

THE third Automobile, Motor Boat and Sportsmen's Exhibition of Canada will be held at Toronto from February 18th to 25th, with Mr. R. M. Jaffray as manager.

THE Chief Constable of Brighton wishes motorists to understand that leaving cars unattended in the public thoroughfares will not be permitted where obstruction is likely to be caused.

AT Peel Street, Accrington, Mr. William Heap has a well-equipped garage, where not only can petrol and spare parts be obtained, but all classes of repairs can be promptly carried out.

MESSRS. C. W. and O. LANCASTER, motor engineers, Settle, Yorkshire, have a well-equipped garage, with accommodation for about 100 cars. A large stock of accessories is kept on hand, and plant is available for the charging of accumulators, the vulcanizing of tyres, and for the carrying out of repairs of all kinds.

LIVERPOOL motorists, and also the American visitors who throng the "Adelphi" during the summer, will be glad to learn that they have now at hand a depot where everything in motor clothing may be obtained. We refer to the new establishment of Messrs. J. A. Turner and Co. In addition to being one of the agents of Messrs. Dunhill, Messrs. Turner also make any kind of motor clothing on the premises, and have on view an extensive stock of goods, and as they have been established for many years they need no introduction.

P.G.R. motor spirit is being introduced into this country in three grades, viz., light, of 700-710 sp. gr.; ordinary, 720-725 sp. gr.; and heavy, 750-760 sp. gr. Several depots have been established in the United Kingdom, and it can be obtained from most of the garages throughout the country. The headquarters of the Petroles de Grosnyi (Russie) Société Anonyme are 101, Leadenhall Street, London, E.C., and the quartette of leading claims for the P.G.R. spirit are lightness, power, purity and economy. Several well-known motorists who have given the spirit extended trial have expressed themselves as well satisfied with the results—both from the standpoint of cleanliness and also mileage per gallon.

AMONG the firms who are now making a speciality of catering for the wants of motorists in the way of motor lubricating oils and greases are Messrs. Butterworths, Ltd., of May Buildings, North John Street, Liverpool. Their productions are used in every clime, whilst the hundreds of testimonials received from automobilists are proof of the quality of the firm's oils. We understand that those motor-owners who have not yet tried the Butterworth oils will, on application, be sent a sufficiency for a real test. The firm has lately issued an elegant autocar log book, which contains a large amount of useful information, and should be in the hands—or pocket—of everyone who makes motoring a trade or a pastime.

THE Englishwoman's Year Book for 1909 comes to hand from Messrs. A. and C. Black, with several new features and the old ones brought well up to date. An article on motoring, by Miss N. G. Bacon, refers to the popularity of motoring and some matters of interest to ladies. She refers to a motor school where ladies are trained to adopt motoring as a profession and gives full particulars of membership of the Ladies A.C. One mistake occurs in the little article which will be apparent to our readers when we quote that "Miss Muriel Thomson was winner of the Ladies' Motor Match at Brooklands in 1908; her car was a 12-h.p. Austin Papplen." The book is of considerable value to all interested in the many activities of women nowadays.

To the order of Messrs. King and Co., 465, Union Street, Aberdeen, Messrs. J. T. Clark and Co., Ltd., Rose Street, Aberdeen, have built a new motor-cab which they have named the Empress. The body is mounted on a 14-h.p. two-cylinder Adams chassis and is of novel construction, designed to completely isolate the driver from the four passengers. To secure this both sides of the body proper are carried forward to the front edge of the driving seat. A central division is fitted on the seat, and the near side of the body in front is closed in so that a recess is formed. In this is placed a seat for one passenger. Two others are carried on the rear seat and the fourth on a folding seat behind the driver, with a back rest tipping towards the off-side door. The measurements have been carefully studied with a view to meeting the requirements of the police authorities.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

INDIVIDUALITY OF DESIGN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We take this opportunity of thanking Mr. Herbert J. Chapman for the eulogistic remarks which he makes regarding certain original features of our car, and we feel that we ought not to pass over some of the questions he raises without reply. He appears to be under the impression that we have given up tiller steering; this is not the case. We have adopted wheel steering and embodied it in one of our standard designs to meet the requirements of clients who prefer this system. We still make tiller-steered cars for clients like your correspondent, who prefer the tiller and single-lever hand control.

In answer to Mr. Chapman's reference to wire wheels, we still believe in wire wheels, and now that a few other firms have followed our lead the public are gradually beginning to understand the advantages of the wire wheel; and it is a significant fact that at the present time practically all the cars we turn out are fitted with wire wheels. Needless

corner is such that a motorist coming round it would not be able to see any one in such a position until it would be too late.

I submit that in all probability the motorist would then have to pay for this wretched fool's carelessness, either by a very heavy fine or a more or less long term of imprisonment. Although this is the only case of the kind which has come under my observation, I have heard of others of a similar nature. This is a serious matter, as the most careful driver may get into trouble through similar circumstances.—Yours truly,

ARTHUR J. RICHARDS.

DANGERS OF PETROL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—A few days ago there appeared in several of the daily newspapers (and also in the *M.C.J.*) a letter from a gentleman who had noticed with some concern the growth of the sale of petrol for domestic

The Scene of the Motor-Car Accident near Conway. The cross marks the point where the lady is supposed to have fallen over the cliffs.

to say, we still supply cars with wood wheels to suit the demands of those who prefer them.

We can understand Mr. Chapman's fears that, having conceded to public opinion in one or two features of design, we may be gradually effacing the individuality of the Lanchester car, but we can assure Mr. Chapman that we have not the slightest intention of building cars of the ordinary type with bonnet in front. The car which we are now building has been our standard design for the past four or five years, and has apparently established itself in the public favour as a rival to the orthodox type which has come to stay, but as manufacturers we cannot afford to lose orders by neglecting the demands of a large section of the motoring public. Thus, in adapting the wheel steering and foot control to some of our cars as a supplementary design, our car is now able to enter a market that was hitherto closed to it.—Yours truly,

C. H. LANCHESTER.

A ROAD DANGER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to bring before the notice of the readers of the *M.C.J.* a fact which came under my observation on the evening of Boxing Day. At about 9.30 p.m. I was out walking and I came upon a drunken man lying across the road at a dangerous corner. The nature of the

purposes, and who drew attention to the dangers which attend such use. The Public Control Committee of the London County Council, as the executive committee under the Petroleum Acts, has a very large experience on this subject, and, as chairman of that committee, I should like to add a few words of warning.

Petrol can be obtained in almost every business street in London, and the public appear to be insufficiently acquainted with the dangers that arise in its use. Whatever warning may be labelled on the vessel containing it, or whatever warning may have reached the mind of the person who is going to use it, seems in a large number of cases insufficient to ensure the observance of necessary precautions. The general public will probably never realise that a light many feet away may be a source of danger, on account of the property possessed by petrol or benzine of freely giving off inflammable vapour, and the slowness with which this vapour will diffuse into the atmosphere. In comparatively still atmospheres, such as that of a room, the heavy vapour will slowly travel distances of ten, twenty or thirty feet in a direction induced by a fall of the ground or gently moving air currents; and, if it reaches a light, will instantly flash back and ignite from the spirit from which it is evolved.

The conditions of domestic life will always expose women who use petroleum spirit to serious risk. In a house there is always the possibility of the presence of a light, and interruptions and incidents may occur at

any moment and cause a woman to forget the precautions she should take. Recently a woman, while cleaning some article of apparel, as she thought at a safe distance from a fire, was startled by the boiling over of a kettle, and, forgetting what she was engaged upon, went to remove the kettle from the fire. The instant she touched the kettle flame leaped to the spirit remaining on her hands and seriously burned her.

Another danger attending the use of petroleum spirit in the manner above referred to results from the careless and almost criminal habit of throwing petrol after use down the drain. A number of serious accidents have occurred in London sewers, and one can hardly imagine a more terrible situation than that of a sewerman, without any avenue of escape, suddenly surrounded by a sheet of flame caused by the ignition of petroleum vapour given off by spirit which has, in a moment of thoughtlessness, been cast down a sink or the pan of a lavatory.

Much advice has been tendered as to the precautions to be taken in using petrol in the home. It is only a shade less mischievous than teaching a child how it may safely play with fire. There is only one proper course. Words of caution are neglected, or never properly reach the intelligence of the user of the spirit, or are forgotten at the critical moment. Dry cleaning should be done only on the premises of a licensed dry cleaner, where skilled workpeople are employed, suitable apparatus provided, and all precautions taken against accident.—Yours truly,

WILLIAM HAYDON.

Chairman of the Public Control Committee, London County Council,
County Hall, Spring Gardens, S.W., January 2.

A SUGGESTION FOR SURREY MOTORISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I trespass once more on your space to ask all motor-car owners in the county of Surrey to take out their licences in any county but Surrey? I think it disgraceful, considering the way in which we unfortunate motorists who live in Surrey, and therefore have to pass through the various parts of Surrey to get out of it, or visit our friends, are mulcted in fines for the most trivial offences by policemen who are taken off their proper duties simply because trapping is so profitable. The police of Surrey invite fast travelling and travelling to the common danger, by reason of never being seen upon the roads; they are all behind hedges, and it is their favourite sport, whilst to expect justice for motorists at such places as Kingston, Guildford, Epsom, Reigate, &c., is utterly absurd.

I do trust that some means will be taken to frustrate the fine-collecting propensities of the Surrey police, who entirely neglect their ordinary duties, as trapping means promotion.—Yours truly,

J. CROW.

STARTING ENGINES BY THE LEFT HAND.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It has long been a mystery to me why motorists and motor drivers almost universally use the right hand for starting the motor. As petrol engines nowadays nearly all revolve like the hands of a watch—from right to left—there is always a possibility of injuring the hand or wrist should a back-fire occur when turning the starting handle by the right hand. And, again, the position which the body must assume when the right hand is used is awkward in the extreme, and being twisted around that more force may be exerted, the balance of the body is not at all secure.

Back-firing accidents may be averted by employing the left hand. In this case the motorist stands squarely in front of the car, the right hand having a firm grip on the radiator or dumb iron. The handle is grasped firmly, but loosely, with the fingers of the left hand curved around the handle. As the feet are placed widely apart, a good balance of the body is assured, and, if a back-fire should occur, the elbow is not cramped, as is the case in the right hand method, but the hand is thrown outward and upward, the loose grip permitting the fingers to fly open, and all risk of injury is done away with. More power may also be exerted, as the right hand on the radiator materially assists the other member to turn the motor over quickly and without undue effort.—Yours truly,

OLD HAND.

MOTORS AND ACCIDENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I draw your attention to the report under the heading of "Motor-Car Accidents" in the daily papers of December 29th and 30th, from which it would appear that a man named William Tibbett was found by a police-constable lying on the roadside near Glington at 7 o'clock a.m. on December 28th? The man had received injuries to the spine and bowels. He stated that he was returning from Peterborough, and, when near Glington, was run down by a motor-car. The occupants of the car, he stated, pulled up, dragged him to the side of the road, and left him there. He lay on the road all night.

The Automobile Association caused exhaustive inquiries to be made in the locality, and our representative now reports as follows:—

"I have personally interviewed the doctor who has the case in hand. He thinks it is quite impossible for the man to have been knocked down by a car, as the injuries sustained are so very slight, being one or two cuts on the hand and a bruise on the buttock. He is certainly suffering from pneumonia, which was brought on by exposure. It was highly probable,

he thinks, that the man ran into an ordinary cycle. So far as I can ascertain the police are not taking any steps in the matter. I have obtained the opinion of another doctor and also a magistrate, and it is universally accepted that the man in some way fell into the ditch, as the night was intensely dark. The man himself attributes his accident to a car. He is, however, entirely alone in this statement, which is almost universally discredited locally."

At an inquest held at Altrincham on the 1st inst. concerning the death of a man named Blease, who had been run over by a motor-car, it was conclusively established that the unhappy victim was in a drunken sleep in the road. His widow is reported to have stated that her husband was addicted to drink, and apt, when under its influence, to fall down in the road and go to sleep. It is hardly necessary to add that the jury returned a verdict of "Accidental death," and exonerated the driver from all blame.—Yours truly,

STENSON COOKE.

Secretary, The Automobile Association.

THE POSITION OF HEADLIGHTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Lawrence's letter in the last issue of the *M.C.J.*, the forks of lamp brackets should, according to some directions recently given in a French journal, be placed absolutely perpendicular to the frame of the car, so that the beam of light will be projected at right angles to the vertical plane. Many motorists think that the lamp should be inclined slightly forward, so as to light up the road immediately in front of the car. This is a mistaken idea, however, as quite enough light will fall on the road directly in front of the car to show up inequalities in the roadway, water courses, &c., and if the beam of light is thrown directly ahead in a horizontal direction, such road dangers as unlighted horse-drawn vehicles will be noticed sufficiently early to avoid collision. For the proper fitting of lamp brackets the car should be placed on a perfectly horizontal floor and the brackets adjusted until they are absolutely vertical and in line with each other.—Yours truly,

PARISIAN.

TO ENCOURAGE THE AVIATION MOVEMENT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—So much talk has been going on in the Press lately on the subject of aviation, and the cause of it not being studied in this country as it ought to be, that I feel justified in sending you this letter, which, if you think worthy of such, I should like to see in your columns. Some papers give as a plausible cause of this country's rear place in the movement of aviation the lack of prizes offered to successful inventors; others to lack of men willing to risk their life and limbs for the sake of progress.

I wish to put forward the case which I and a few workfellows of mine consider as ours. I have studied aviation and watched its progress for the last six years. I made Professor Langley's aeroplane my starting point in model making, and I have made several working models which have satisfied my expectations, but I got thus far and no further—not because there are no prizes offered. All the prizes in the world would not advance me much, and I would gladly give time and the little I have learnt on the subject, and risk my life in attempting to fly, but I cannot give that which I have not got to the cause of flight, and that is the necessary capital to make a man-lifting aeroplane.

I am sure I am not the only one in this condition, and I think that some rich enthusiasts could sacrifice a little to help poor inventors willing to do their best for the movement.—Yours truly,

WILLING TO HELP.

REPLYING to P. J. and Co., the name and address of the makers of Oldsmobile cars is the Olds Motor Works, Lansing, Mich., U.S.A.

THE sketch bearing the legend "A new idea in Country House design" was the work of Mr. W. G. Aston, and first appeared in our late contemporary "Motoring Illustrated."

TOWN FOR REPAIRER.—"E. D." writes that he is desirous of starting in business as a motor-car repairer. He wants to know of a growing town that is not adequately supplied in that respect.

A CLIENT of the Jermyn Street Motor Hire and Repair Works, Ltd., on Thursday, December 31st, lost his 880 by 120 Stepney wheel and cover between West Hill, Sydenham, and Wells Street, London, S.W. The company will be pleased to hear from the finder.

REFERRING to the letter from Mr. Theodore Tinne on the Dust Problem in our issue of the 26th ult., "Headlight," in the "Planet," says:—"Mr. Tinne thinks that a course of experiments might indicate a definite relation that ought to exist between the total adhesive weight of a car and the power of the engine that is to drive it, suggesting 1 cwt. to 1 h.p. as a possible solution to the difficulty. I think that it would be difficult to lay down any hard and fast rule, for differences of road surfaces and slopes would make this well-nigh impossible, but I do think that the majority of drivers do not realise that there is always a maximum efficient speed which is constantly varying according to surface, slope, and relation of h.p. to the weight of the car. Acceleration of the engine when this speed is reached may increase the pace, but the increase is infinitesimal compared with the amount of power that goes to waste in the shape of 'slip,' with the result that the waste in petrol and wear of tyres is out of all proportion to the advantage gained, not to mention the dust which is kicked up in the process."

MOTORIZING ACCESSORIES.

Benetfink's Accessories.

We have received from Cheapside, London, E.C., a supplementary list of the latest motor accessories, clothing, &c., stocked by Messrs. Benetfink and Co., Ltd.—a useful addition to the recently-published catalogue entitled "Everything for the Motorist." This contains illustrated descriptions of wrenches, pliers, terminals, and other "little things that count for much," as well as of horns, lamps, non-skids, &c. A section of the list is devoted to motor clothing, stylish garments for ladies and gentlemen being illustrated in great variety.

Moseley Tyres.

A new list of Moseley tyres has been issued by Messrs. David Moseley and Sons, Ltd. This can be obtained by readers on application to the firm at the Chapelfield Works, Ardwick, Manchester. It gives particulars of the firm's non-skid detachable tyres, their plain beaded-edge tyre with square tread, which is guaranteed for 3,000 miles within six months; and their non-skid beaded-edge tyre. Space is also devoted to their tough grey motor tubes, which contain but a small proportion of mineral matter and can be patched many times without any evil consequences to the rubber. Particulars of the re-treading and repairing department of Messrs. David Moseley and Sons, Ltd., are also given in the list, as well as a description of the detachable tyre, which, having been thoroughly tested for four years, comes with the recommendation of experience. This is attached to a special rim which can be fitted to any wheel without charge. The wheel itself consists of a hollow metal hoop concaved at each side so that it can take the rings of the flanges. These are detached by means of a turnbuckle screw with a right and left hand thread. By means of a tommy-bar the bead can then be extended for the removal of the tyre. The turnbuckle and the space above are completely covered by a little metal clip, so that mud or other possible intrusions are excluded. It is claimed that Moseley's tyre can be detached, a new inner tube inserted, the tyre re-attached and inflated in from five to ten minutes by any novice.

Electrical Specialities.

From Messrs. C. A. Vandervell and Company, of Warple Way, Acton Vale, London, W., comes a useful catalogue (conveniently divided into six sections to facilitate the reference to their electrical productions for motorists), a copy of which they will be pleased to send to any reader on application. Their specialities include accumulators, ignition coils, electric driving and interior lighting lamps, magnetos, charging plants, switchboards, sparking plugs and other accessories calculated to add to the convenience of the motorist. We hope to refer to some of the leading specialities in an early issue; meanwhile we would mention that their department for the repairing of accumulators, coils, &c., is one of real convenience to the motorist.

The Gabriel Horn.

In our issue for the 26th ult. we made reference to the Gabriel Horn.

Fig. 1.

For 1909 this is being made with a new valve which is said to be a great improvement on that which has hitherto been fitted. It is claimed by Messrs. Brown Bros., of Great Eastern Street, London, E.C., who are placing the horn on the British market, that it cannot stick up under any conditions.

received the serious attention it deserved from those who own cars, and some views on the subject brought to our notice by the County Chemical Company, Ltd., of Bradford Street, Birmingham, are deserving of notice. The heavy stiff grease which has often been employed is liable to cut into tracks, leaving the gear wheel to run unlubricated, setting up friction and causing wear. Then it has also been observed that as the bearing in the box cannot be lubricated until sufficient heat is engendered to melt the gears the bearings have a very short life, a noisy gear-box

becoming inevitable. Of course the ideal system of lubrication is to have a film of oil adhering to each of the rubbing surfaces. Thus the friction of solids is prevented and a fluid friction only is set up. This result can now be obtained by the adoption of "Vasoleum"—a lubricant for gears and differentials brought out by the County Chemical Company, Ltd. While securing such a result "Vasoleum" is of sufficient consistency to prevent leakage either through the gear-box or axle sleeve. The use of this lubricant will ensure quiet running of the parts, prevent all undue wear, and generally facilitate the work of changing gears. Altogether "Vasoleum" is one of those standard specialities of the company that deserve a trial from the many motorists who have not yet secured their ideal lubrication.

Vasoleum.

The question of the lubrication of gear-boxes and back axles has scarcely

A Special Rim for Detachable Non-Skids.

The Shrewsbury and Challiner Tyre Company, Ltd., Manchester, have lately introduced the special rim illustrated in Fig. 2, to overcome the difficulty of detachable non-skid bands injuring the walls or beads of

Fig. 2.

the tyres, by the chafing action of the metal hooks, this being prevented by employing a secondary clinch A to the rim. The ordinary clinch admits the bead of the tyre as usual, and the second carries the hooks of the non-skid, the chrome leather band of which envelopes the whole of the tyre, so that no metal portion is in contact with the actual cover. The firm find the arrangement is most economical in use, as the ordinary tyre can be used without a rubber tread, the price of which is about 25 per cent. cheaper than the round-faced tyre. Of course the band can be renewed from time to time on the same casing and can be retreaded at half the original cost.

Tools and Horns.

Mr. R. Broadhurst, of Smithford Street, Coventry, is introducing to motorists some extremely good types of accessories. Several specialities are referred to in a new list just issued which will be of service to owners of cars anxious to be acquainted with the latest devices for their efficient and economical use of their vehicles. A useful accessory is the "Autorette" ratchet and box-tube spanner. This is supplied in a neat, well-finished and durable leather case with a stiffened back, well capable of withstanding any rough usage to which it may be subject. The spanner has an extension piece for the six sizes of the box-spanner and tommy bar. Mention may also be made of another series of motor box tube spanners marketed by Mr. Broadhurst. This set consists of a dozen key spanners of the most useful sizes, an extension piece and a spanner. The key spanners take practically all nuts from $\frac{1}{2}$ in. to $1\frac{1}{2}$ in. across the flats, and the set comprises all the sizes commonly used in motor work. A point worth noticing is that the spanners can be used with handle alone, thus corresponding to bent box spanners or with the extension piece and handle. In the latter service it corresponds to the improved straight box spanners, as the handle is a much more satisfactory tool than the ordinary tommy. Motor tool kits, jacks, and similar tools are also handled by Mr. Broadhurst, whose specialities also include horns of various patterns and tones. Among the latter is a new oval Sirene and the "Aurora." The latter is of such a design that it can be fitted in a very small space in practically any position, whilst its deep sonorous note makes it a very effective road clearer. The list in which these goods are described is, as we have said, one of considerable interest and should find favour with our readers.

CLUBS AND ASSOCIATIONS.

MOTOR UNION.

THE partnership between the R.A.C. and the M.U. ceased on the 31st ult., and in a farewell word the latter declares that it stands in a much stronger position now than at any other period of its history.

Car owners and motor-cyclists who have not yet joined any automobile organisation were probably interested in the advertisement of the Motor Union in our last issue. The Union has a record of good work accomplished for the benefit of motorists in both its legislative and touring departments. Its achievements in appeals in the High Court and at Quarter Sessions have proved to the advantage of every motorist, and its constitution is such that the control of affairs is entirely in the hands of the duly elected representatives of the individual members (who pay one guinea per annum) and the representatives of affiliated clubs.

NOTTINGHAMSHIRE.

THE annual dinner of the Nottinghamshire A.C. is being held on Friday, the 8th inst., at the Victoria Station Hotel, Nottingham. H.S.H. Prince Francis of Teck will be present.

The club held a committee meeting on the 1st inst., when it was resolved that a medal be presented to Mr. M. Ross Browne, who has won more of the club's competitions during the season than any other member.

On the 21st inst. Mr. C. Y. Knight will lecture on his engine, and on the 28th inst. the annual meeting of the club will be held at the headquarters.

SCOTTISH.

As announced in our last issue, the Scottish A.C. has acquired a club and motor house in Blythswood Square, Glasgow. This is the fine open square in which the cars assembled for the start of the 1906 Scottish Reliability Trial, and the house is easy of access from West Campbell Street.

It is hoped to set apart accommodation for the use of lady members of the Club, and after the official entry into the premises at Whitsun they will be adapted to the purposes of the Club with all possible speed. New members are now being admitted for the financial year commencing February 1st next. Mr. R. J. Smith, 163, West George Street, Glasgow, is the secretary.

AUSTRALIAN CLUBS.

THE Automobile Club of Victoria held a hill-climbing tournament at Lilydale recently, a feature of the contest being the fast times put up by Mr. J. W. Moffat on his 25-h.p. Talbot.

A reliability trial organised by the Tasmanian A.C. took place on November 7th and 8th, the course selected being from Launceston to Hobart and return, a total distance of 243 miles. Seventeen cars took part in the run, the winners of the classes being Messrs. T. C. Archer (Cadillac), A. Hart (Darracq), and P. O. Fysh (Argyll).

A one gallon petrol consumption trial was announced for the 12th ult., with the following circular route:—From Kew or Camberwell, via Norwood Road to junction just outside Fern Tree Gully, and thence via Oakleigh and Malvern back to the starting point.

THE Liverpool A.C. and the Shropshire A.C. have decided to associate with the R.A.C.

THE Liverpool A.C. is giving up the club room in the Exchange Hotel, Liverpool, and committee meetings, &c., will in future be held in the secretary's office, 1 and 2, Ashton Chambers, Hackins Hey, Liverpool.

ROAD REPORTS.

RICKMANSWORTH.—Motor warning signs are to be erected at Mill End, Rickmansworth.

SUSSEX.—Application is to be made to the L.G.B. by the East Sussex County Council for the imposition of a ten miles an hour speed limit on motor-cars on a portion of the Tonbridge to Hastings main road in the parish of Salehurst. Objections, if any are to be made, must reach Whitehall by January 14th.

TEN MILE LIMIT APPLICATION.—Among the applications which have been lodged with the Local Government Board for the institution of ten mile speed limits are those of High Wycombe, Findon, Calford and Mayfield, Sussex.

HAMPSHIRE.—The Winchester and Romsey road at Ampfield Hill is under repair, as is also that between Kingsclere and Basingstoke at Pitt Hall.

FROM Messrs. Warwick Wright, Ltd., comes a copy of the latest catalogue of Metallurgique cars. This is arranged in a somewhat novel method, which enables the page referring to any particular model to be turned to instantly. For the 1909 season four types are being made, viz., 12-h.p., 18-h.p., 26-h.p., and 40-50-h.p., all fitted with four-cylinder engines. Full particulars are given of each of these cars, while many of the special details of the chassis are illustrated. References are also included to the Metallurgique motor-boat, and to the Glissoire shock absorber.

CASES AGAINST MOTORISTS.

"ONLY TWO."

According to a local report "only two motorists were summoned at Grantham on Saturday for exceeding the speed limit on the Great North road."

A TRAILER POINT.

At the Newport (Salop) Petty Sessions Pryce Henry Lloyd, of Queen Street, Wrexham, haulier, was charged by Sergeant Roberts that he, on the 30th ult., at Newport, being the owner of a trailer attached to a heavy motor-car, did not have the weight, &c., painted legibly thereon as required by the above orders. A further charge was also preferred for not carrying a person on the said trailer competent to effectually use the brake thereof, such brake not being so constructed to be able to be worked from the motor. Defendant was fined 10s. and costs (8s.) in each case, the licence being endorsed in respect of the latter charge.

THE SPECIFICATION OF POLICE TRAPS.

At Wimbledon, Mr. E. A. Lastsmith, of Drayton Gardens, Kensington, was summoned for driving a motor-car at a speed exceeding the twenty miles speed limit in Morden Road. Mr. Leechman, who defended, contended that the summons was irrelevant and wanting in specification. He quoted a decision given in the Scottish Court of Session in July last. In that case the defendant was first charged at Dumfries Sheriff Court with driving a motor-car over a quarter of a mile on the Ballock road at thirty-six miles an hour. The Sheriff repelled an objection to the relevancy of the complaints, but the Court of Session set aside the conviction. Lord Ardwell, who gave the leading decision, said the action was irrelevant and the pleadings wanting in specification, as they did not say the exact distance over which the speed limit was exceeded. It was not sufficient merely to say a quarter of a mile. The present case, Mr. Leechman said, was much stronger than the Scottish one, for the summons did not say where the offence was committed, except in Morden Road. He held that it must set out exactly the distance measured from point to point. The Bench adjourned the case for a fortnight in order to consider the point raised. A number of summonses for similar offences were also adjourned.

PASSING ON THE NEAR SIDE.

At the Brentford Court, Sydney Jebb, giving an address at the Army and Navy Club, Pall Mall, and also of Firbeck Hall, Yorkshire, was summoned for negligently driving a motor-car at Brentford, and on a second summons for failing to give audible and sufficient warning by sounding a bell or other instrument of the approach of the car.

Mr. Barker, who prosecuted for the Commissioner of Police, said that on the afternoon of November 21st a boy was alighting from a tramcar at the compulsory stop at Kew Bridge. A motor-car driven by the defendant came along between the tram and the kerb, struck the boy, passed over him, and inflicted serious injuries. The lad was now out of danger, and he (Mr. Barker) wished to state that the defendant had dealt generously with the lad, who was in a nursing home. He pointed out that a motorist approaching the near side of a stationary tram was bound to reduce speed to such a degree that there would be no danger to passengers alighting from the car, and he should also give notice of his approach.

Mr. Jebb said he put the brake on as soon as he saw the lad, and released it to prevent dragging the boy. His car was going at about ten miles an hour, and he could not say if he sounded his horn at that point, but he had frequently done so just previously. In his opinion, he was justified in passing a stationary tramcar on the near side, and he saw nothing of the boy until about five yards away. The lad appeared to be about to run to the kerb and then hesitated and went at a slower pace.

In giving the decision, Mr. Montgomery said that this was an illustration of the dangerous practice of motor-cars passing on the near side of a tramcar. The penalty would be £5 and £5 costs, and the second summons, for not giving notice of approach, would be dismissed.

ELECTRIC TAIL-LIGHT.

It was through no fault of Mr. T. Davies, Chief Constable at Portsmouth, says the "Sussex Daily News," he should have failed, at the week-end sitting of the Borough Court at Portsmouth, to have substantiated a prosecution against a prominent motor-car owner of Sussex for an alleged breach of the Parliamentary Act governing the carrying of rear lights on motor-cars. Two of Mr. Davies' policemen said they were certain that when the car of Mr. George Wilder, of Stansted Park, Sussex, passed them in the London Road, on November 10th no rear light was visible. The Sussex squire, however, had a novel and strong defence. Mr. Wilder asserted that his car was fitted with electricity, that the rear six-candle power light was just above the identification plate, that the whole of the lamps were supplied from the same accumulator, and that on reaching Stansted Park the rear lamp was found fully alight. The inference, therefore, was that after the policemen had seen the glare of the front lamp it had prevented them seeing the small rear light. The magistrates believing that the policemen might have been mistaken they dismissed the information.

A FINE INCREASED.

A singular course was adopted by the Shoreham magistrates on Monday in regard to a previous judgment in a summons against Albert Harris, chauffeur, of Manor House, Hove, for exceeding the speed limit. Originally the justices imposed a fine of £20 and ordered the licence to be suspended. Defendant's employer, a military officer, asked the Bench to impose the heavier penalty of £30 (which he was prepared to pay), in order

to avoid the suspension of defendant's licence. It was stated that Harris was a careful driver, and that he had exceeded the proper speed at the request of his employer, who was in a hurry to return to barracks. The fine was increased to £30.

BATCHES.

At Kingston four motorists were fined on the last day of 1908 for exceeding the ten-mile limit in Richmond Park. Others were also convicted for exceeding the legal limit on the Portsmouth road. Six motorists were also dealt with on the same day at Croydon—fines in every case.

EXCEEDING LEGAL LIMIT.

Mr. Constantine Doresa, one of the survivors of the disaster at Messina, was fined at Woolwich on Tuesday for driving a motor-car at the rate of twenty-seven miles an hour in Shooter's Hill Road, on December 22nd. Defendant appeared in person, and pleaded "Guilty." Two other convictions were proved against him, and he was fined £7 with 14s. costs.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE Polack Tyre and Rubber Company has been registered with a capital of £40,000.

MESSRS. MAX GRADDON AND LAWSON, LTD., has been registered as a limited liability company with a capital of £2,000, and offices at Mildmay Avenue, Newington Green Road, N.

ROM TYRE AND RUBBER COMPANY.—£5,000 (4,000 £1 preference shares and 4,000 5s. ordinary). As title. 32, Rosebery Avenue, London, E.C. (100,642.)

VINET RIM SYNDICATE.—£10,000 (£1). Dealers in motor accessories, &c., sole agents for the United Kingdom and its colonies and dependencies for the Vinet rim, &c. Agreement with M. Kapferer. (100,577.)

LONDON ROAD-CAR COMPANY.—In a circular to the debenture stockholders, the secretary of the company states that he is forwarding warrants for interest on the debenture stock. Payment is made at the rate of 5 per cent. per annum in order to comply with the provisions of the contract for the sale of the company's undertaking to the London General Omnibus Company, which provides for the exchange of the present 4 per cent. debenture stock for 5 per cent. B debentures of the latter company. The amalgamation of the undertaking with that of the London General Omnibus Company has proceeded since the resolution of July 24th last, and the business is approaching completion.

BEAUFORT MOTOR.—For the year ended June 30th, 1908, the directors have been chiefly concerned in settling the liabilities of the company and realising stock on hand to the best possible advantage. The directors have succeeded in arranging matters satisfactorily, and have agreed to transfer the goodwill of the company to the London and Paris Exchange Motor Agency, Ltd., for £25,000, being half the nominal capital in that company. The directors have agreed to forego their fees in respect of the past year.

RESIDE AND CO.—£3,000 (£1). Agreement with J. Reside and W. Barraclough, to acquire the business carried on by Reside and Co., and to carry on at Brighouse and elsewhere the business of electrical, mechanical, and motor engineers, &c. Perseverance Works, Huddersfield Road, Brighouse. (100,812.)

HUMBER, LTD.—The annual meeting of Humber, Ltd., was being held at Coventry last week as we went to press, Mr. Edward Powell, chairman, presiding. The chairman said in the early part of this year the directors had reason to anticipate a trade which would have resulted in a good balance-sheet, but when trade became depressed the directors thought it was not good policy to insist upon contracts which had been placed being carried out. Cars had been sold at large reductions. The motor business was now double the value of the cycle business, and that huge motor business had been grafted on to the cycle section with but little increase of capital. In 1900 their sales amounted to £223,000, while seven years later the sales amounted to the huge sum of £1,080,000. For the past year sales totalled £682,000. It was said that the Humber trade had gone, but from August last to December 25th, which was the dead season, sales had totalled to £105,000. With regard to the reconstruction scheme, the chief criticism seemed to be directed against the preference shareholders being asked to subscribe more than the ordinary shareholders. He pointed out that preference shares would be entitled to a cumulative preferential dividend of 8 per cent. He moved the adoption of the report. Mr. Davy seconded the motion. Lord Russell thought that due time had not been given to the shareholders to study the reconstruction scheme. The shareholders had to face the situation that last year they received 20 per cent. dividend while this year they had to listen to suggested liquidation. He, therefore, moved that the meeting stand adjourned with a view to an independent opinion being obtained upon the affairs of the company and the proposed scheme from a committee. Mr. Basden seconded, and suggested that an adjournment should take place before speeches of criticism were made. The resolution of adjournment to January 31st was carried unanimously and a committee was appointed, this consisting of Earl Russell, Mr. D. F. Basden, Major Ashworth (Nottingham), Mr. Frederick Goddard, Mr. G. E. Haworth (Manchester), Mr. R. Fane De Salis (London), and Mr. Berry (Leeds).

FIAT MOTORS, LTD.—At the meeting of Fiat Motors, Ltd., held on the 31st ult., the report of the directors for the year ending September 30th was submitted. This recorded that the balance-sheet showed a net loss of £7,677, almost entirely accounted for by extraordinary circumstances.

The new works and stores at Wembley are now completely organised and for the last few months have shown a substantial profit, which should be increased in the future.

MAJOR SPILSBURY has presided at an extraordinary general meeting of the Mercedes Company, at No. 1, Broad Street Place, London, at which a resolution was passed authorising the alteration of the capital of the company, consisting of £350,000 ordinary shares of £1 each. The following were the terms of the resolution:—"That the capital of the company be divided into £250,000 ordinary shares of £1 each and into £100,000 6 per cent. preference shares of £1 each."

MOTORING IN NEW ZEALAND.

THE usefulness of the motor-car was again shown during the Ministerial party's tour through Otago Central. A 12-14-h.p. "Stuart" car awaited the Prime Minister at Omaku, and took him and his party to the towns off the railway line, while the Minister of Lands travelled along the line and received the deputations there. The car left Omaku at 10.35 a.m., running over the Manuherika Bridge to Ophir. Leaving Ophir at 1.25, Cambrians Creek was crossed within half an hour, and the Dunstan Creek a little later. Nearing St. Bathans, however, a short halt was made to inspect the "flushing channel," a fast flowing stream about two feet

[Rivista Mensile del T.C.I.]

deep. There was no time to wait, however, and the Stuart made a plunge in and got safely up the other side. A ford like this, states the "New Zealand Motor and Cycle Journal," would have caused no end of fun in the New Zealand Reliability trial, as the Mayfield watercourse which "hung up" several cars in this event was absolutely nothing to it. A right hearty welcome was accorded the party at St. Bathans by the residents of this typical mining town, which was decorated with flags, &c., and ringing with cheers for the Prime Minister. A stop was afterwards made at Rough Ridge, and the night spent at Naseby. Leaving this town at 10.45 a.m. next day, an easy run on first-class roads saw the Prime Minister receiving the Waipiata deputations at 11.40, and then the car was railed back to Dunedin. During the whole run a distance of some eighty odd miles was covered in about four hours travelling time, with a short stop to remove an offending drop of water in the carburettor, this being the result of the bath in the St. Bathans flushing channel. Without the car several of the out-of-the-way towns would have had to be cut out of the programme. We might add that the car in question is a Star, built by the Star Engineering Company, of Wolverhampton. Owing, however, to another firm having registered the word "Star" before the Star Engineering Company placed its vehicle on the New Zealand market, their machines are known there as the "Stuart."

FORTHCOMING EVENTS.

JANUARY, 1909.

- 12th (Tu.).—Extraordinary General Meeting of the Automobile Association.
 14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
 16th (S.).—Last day for receiving Short Stories for the *M.C.J.* Competition—see page 967.
 16th-25th.—Brussels Motor Show.
 21st (Th.).—Annual General Meeting of the Southern Motor Club.
 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
 23rd (S.).—Annual Dinner of the Coventry Motor Club at the Craven Arms Hotel, Coventry.
 Annual Dinner of the Lancashire A.C. at the Park Hotel, Preston.
 26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.
 30th (S.).—Annual Dinner of the Auto-Cycle Club.

FEBRUARY.

- 2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.S.H. Prince Francis of Teck will be among the guests.
 4th (Th.).—Annual Dinner of the Southern Motor Club.
 19th-27th.—Manchester Motor Show at Belle Vue.
 17th (W.).—Paper on Lubrication by Mr. J. W. G. Brooker at the R.A.C.
 24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
 Motor-Car Show at Barcelona.
 20th-27th.—Cordingley's 14th Annual Motor-Car Exhibition and Market, Agricultural Hall, London.

MAY.

- 14th (F.).—British Motor Boat Club meeting at Erith.
 24th-29th.—Irish Reliability Trials—provisional date.

JUNE.

- 14th (M.).—Commencement of the Scottish Reliability Trial.

AUTOMOBILE ACCIDENTS.

A SAD accident in the district of Penmaenmawr on Saturday night is reported. Two ladies, daughters of Mrs. Charlesworth, of Boderw, St. Asaph, were returning to St. Asaph from the direction of Bangor. The younger Miss Charlesworth was driving, and the chauffeur sat beside her, whilst her sister sat behind. The part of the main road along the coast where the car came to grief is about fifty yards on the Conway side of Penmaenbach point. There is a jagged piece of rock projecting upwards a considerable height between the road and the precipice, and known locally as "The Devil's Thumb." The road dips downwards on the Conway side of this rock, but not at all steeply. Miss Charlesworth appears to have lost control of the car, which swerved suddenly to the left, dashed towards a narrow opening in the boundary wall, knocked part of the wall down, jumped through the gap, and came to rest within about eighteen inches of the edge of the cliff. The younger Miss Charlesworth was thrown from her position at the wheel, and over the edge of the cliff. No doubt in falling down the cliff she would be stunned and much injured, but, in any case, her body rolled or dropped a distance of sixty feet into the sea, the tide being at the flood at the time, and was carried away, her hat only being afterwards found. The elder Miss Charlesworth was not thrown out of the car, and only sustained a severe shock. The chauffeur was thrown from his seat and fell on to the rock. At present the circumstances appear difficult to understand.

In Dumbarton Road, Glasgow, on Monday evening, a motor-van became wedged between two electric tramcars travelling in opposite directions. The motor-car was smashed, and the driver sustained injuries necessitating his removal to the infirmary. Both the cars were badly damaged, and one, derailed, crashed through a shop window.

THE British Barignand and Marre Engine Company, Ltd., 10, Poland Street, Oxford Street, London, W., have just issued their new catalogue of the "B. and M." motors. The list is well got up both from a typographical point of view and in the clearness with which the various salient features of each item of the components are shown. It contains much of an informative and interesting nature, and includes an illustration of the new type "F" four-cylinder "B. and M." engine (80 by 100 mm.), which has been specially constructed for van and cab work. The firm will send a copy of the catalogue to any of our readers mentioning the *M.C.J.*

"POLICE CONTROLS."

THE police "control" in the Coombe Road, New Malden, has been actively at work during the last few days, and not only have the police been timing motorists, but the production of licences has been demanded in many cases.

At Saltwood, near Hythe, a police trap has been established. ACCORDING to a local paper "the wintry weather has had an adverse effect upon the Kesteven police traps, for only two drivers were hauled before the Spittlegate (Grantham) Bench on Saturday last."

BUSINESS NEWS.

MESSRS. JOHN HUTTON AND SON, of Dublin, are the agents in Ireland for the White steam car.

A NEW departure in the matter of guarantee has occurred to Mr. Chas. Friswell, and as from the 1st inst. the "Standard" six-cylinder car, manufactured at Coventry, will be guaranteed as follows:—"Friswell (1906) Limited, hereby guarantee the "Standard" Motor-car No.-- this day delivered, and further agree to execute gratuitously all necessary repairs (tyres excepted) not arising from, or due to neglect, or accident, for a period of twelve months from this date." In sending us this information Messrs. Friswell remark that "the difference between this guarantee and the ordinary one is this: The usual custom of the trade is to give a twelve months' guarantee to replace parts which break by reason of flaw or fault in workmanship; these parts must, however, be first returned to the works for examination, and if found faulty are replaced free of charge. The guarantee, however, does not include the fitting of these parts, and therefore, when the bill for the repairs is rendered the value of the parts replaced very often is a mere shadow, as compared with the bulk of the bill. The meaning of our guarantee, however, is that, no matter what happens, we guarantee to keep the machine in thorough repair, provided that it has ordinary care."

As was briefly mentioned in our last issue, Mr. Tom Williams, who until recently was responsible for the management of the commercial side of Vauxhall Motors, Ltd., is putting a car on the market to be known as the "Williams." Two types of this machine will be available, viz., a 16-h.p. and a 20-h.p. model, fitted with engines comprising four cylinders cast *en bloc*, of 80 mm. and 90 mm. bore respectively, magneto ignition and White and Poppe carburettor. The vehicles are being manufactured by Vauxhall Motors, Ltd., whose successes during the past year in the 2,000 miles trial and hill-climbing events are a guarantee that the new car will be a high grade machine. Mr. Williams intends to make a special feature of taking second-hand cars of any make in part exchange, and he also has an interesting scheme in hand that will appeal to agents. The home of the Williams car will for the present be at the depot of Swan, Ltd., 212, 214, 216, and 228, Pentonville Road, King's Cross, N.

CAPTAIN THEO MASUI asks us to state that only those chassis of the Gregoire-Gordon cars which are supplied through him, and bearing his special name plate and number, carry his full guarantee, and are built especially for the English market according to his specification, and will be tuned up under his supervision. He cannot accept any liability regarding Gregoire chassis which are supplied through other sources, neither is he prepared to supply spare parts for same.

NEW works have been opened for the production of the Lee-Trigwell detachable skidless band, which is being marketed by the Automobile Contract Company, Ltd., 51, Conduit Street, W.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, JANUARY 16, 1909.

[No. 515.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

PRIZE COMPETITION.

AS recently announced, we are offering a prize of two guineas for the best original short story of motoring interest suitable for publication in the *M.C.J.* The story should be between 1,000 and 1,200 words in length, and the main incident should, of course, centre about the automobile.

The latest date for submitting the MSS. will be the first post to-day, January 16th, 1909, and the award will be notified as soon as possible after that date, the Editor's decision being final.

With reference to the stories which do not win the prize, the right is reserved to publish any which we may deem suitable, making payment at our usual rate of remuneration.

All MSS. should be forwarded addressed to the Editor, *M.C.J.*, 27-33, Charing Cross Road, London, W.C., the envelopes being marked "Short Story" on the top left-hand corner.

COMMENTS.

LAST week we commented upon the Brentford case, in which the magistrate fined a motorist for not passing a tramcar on the off side and suggested that the particular circumstances of the moment should be taken into consideration in such cases. This seemed reasonable, especially as the Commissioner of the Metropolitan Police had declared there was no definite rule or law on the subject. On this point an important instance has occurred at Bradford. Two tramcars were standing alongside, leaving ample space to pass on either side, but not enough for a vehicle to go between them. The driver of a motor-car belonging to Mr. J. Wade, a member of the Bradford A.C., passed the tramcar, which had been travelling in front of him but was temporarily stopped to discharge passengers, on its left or near side. This was contrary to Article 4 of the Motor Cars (Use and Construction) Order, 1904, which reads:—"Every person driving or in charge of a motor-car when used on any highway shall comply with the regulations hereinafter set forth—namely, he shall when meeting any carriage, horse, or cattle, keep the motor-car on the left or near side of the road, and when passing any carriage, horse, or cattle proceeding in the same direction, keep the motor-car on the right or off side of the same." For not acting according to the regulation the driver, Burton, was summoned, and the Bradford magistrate, being of opinion that a tramcar was a carriage within the meaning of the Order, convicted the defendant. The Bradford A.C. took the matter up, and their solicitors having got the stipendiary to state a case secured the matter being taken to the Court of Appeal.

Tramcars v. Motor-cars.

THE case was heard on Tuesday before the Lord Chief Justice, Mr. Justice Bigham and Mr. Justice Walton, and, on a strict construction of the case, they dismissed the appeal. The Lord Chief Justice pointed out that in framing the regulations it had been overlooked that on certain roads there were vehicles that ran on fixed rails and were incapable of lateral deviation. Obviously in many cases the regulation compelling motor-cars to pass on the off side could not possibly be carried out; for example, in the case of a motor-car overtaking a tramcar pro-

ceeding from Westminster Bridge to Blackfriars along the Thames Embankment. It was obvious that though the obligation might in some cases be desirable, as when passengers were alighting from a tramcar, a hard-and-fast application of the Order would lead to danger and difficulty. At the same time it was impossible to say that a tramcar was not a carriage. He would gladly have held that tramcars were not carriages for this purpose had he been able to, and in his judgment the sooner the regulation now in question was modified the better it would be. The other members of the Court delivered judgment to the same effect. We understand that an attempt will now be made to secure an amendment of the Local Government Board regulations—a matter that rests with Mr. John Burns, whose practical acquaintance with traffic questions should lead him to fall in line with the view of the Lord Chief Justice without much delay.

Motor-car Imports.

THE final month of 1908 fully maintained the reputation for quietness which last year obtained as regards the importation of foreign-built motor-cars and parts into this country, the total of cars, chassis and parts only amounting to £216,680 as compared with £224,862 in December, 1907. Taking the whole of the past twelve months, however, the shrinkage in the imports is probably not so great as many have, in view of the quietness of trade generally, expected. The arrivals of complete cars during the year numbered 3,830, of a value of £1,389,552; 3,370 chassis estimated at £1,063,077 were also received, to which have to be added motor-car parts to the extent of £1,659,832. It is not possible to give an accurate comparison of these three items with 1907, as the basis on which the return is made was not on the same lines. The value of the aggregate imports of cars, chassis and parts, however, only reached a total of £4,112,461, as against £4,552,786 in 1907 and £4,371,660 in 1906.

Exports of British Motor-cars.

TURNING now to the British export trade in motor-cars during 1908, the returns available show that this branch has also been affected by the general depression in trade, the value of the aggregate shipments during the last twelve months only having amounted to £1,262,803 as contrasted with £1,324,958 in the preceding twelve months. Altogether 2,220 complete cars were sent out of this country during last year, of an estimated value of £803,579. The number of chassis exported was 225 (£75,984), while parts were responsible for a further £383,240.

A Question of the Early Future.

SEVERAL interesting questions will arise as the airship goes into the air. The Congress that has been sitting in London this week has been mainly concerned with the sporting side of aeronautical advance. But there are legal issues involved, as Mr. Roger Wallace has pointed out, and these must be settled in a broad manner so as not to hamper progress or discourage experiment. Major Baden-Powell, whose military fears have been somewhat discounted by the views of other officers, draws attention to an initial point upon which agreement should be found in this country. One of the matters to decide upon, he suggests,

is as to who is to be considered the responsible head in such affairs. Are these questions for the Home Office, or is the Board of Trade to have control? The Foreign Office and the Defence Committee will also want to have their say. Then how are such difficult issues to be decided, when we have no experts with any experience of aerial navigation (beyond a few trials in very primitive apparatus)? The council of the Aeronautical Society of Great Britain is now considering the various points of importance, and may be able to lay valuable suggestions before such a body as is finally appointed to control those going up in the air in ships. Probably the Aero Club, too, and other bodies may be able to offer good advice. But such institutions cannot make the laws! Who, then, shall legislate for the aerial State?

The President-elect of the U.S.A.

♦ ♦ ♦
 MR. WILLIAM H. TAFT, the President elect of the United States of America, is following in the Roosevelt line so far as the automobile is concerned. Some time ago we reproduced a photograph of the retiring President on his White steam car, taken at his summer residence at Oyster Bay. Now Mr. Taft has

chosen a car of similar make for his personal use during his presidency. By the kindness of Mr. Frederic Coleman we are able to reproduce a photograph taken during the Christmas holidays at Augusta, which is the first picture ever taken of the whole Taft family since his election. The fact that Mr. Taft has been travelling on official business in different parts of the world while the children have been at school has made such meetings very rare indeed. Mrs. Taft is seated next the President-elect on the rear seat, while the children are seen in the revolving seats, and the youngest child is sitting next to the driver, H. N. Searles, who has been in charge of President Roosevelt's White cars for two years.

Roadway Dangers.

♦ ♦ ♦
 THE dangers of the tramway and electric light standards placed in the centre of the roads have often been referred to in these columns. Point is given to the risks run by an accident which occurred the other day to the Hon. Lionel Walrond, M.P. He and Mrs. Walrond had been to the Devon County ball at Exeter, and the former was about to return to Bradford, Mrs. Walrond staying in Exeter. Accompanied by Mr.

H. A. Troyte, he started from the city, a chauffeur driving the car. A skid caused the vehicle to collide with the tram standard in the middle of the road, with the result that the M.P. and the driver were badly cut about the face and hands by being pitched forward into the wind screen. A local report says that many people are not surprised at the accident happening, and have wondered that many others have not previously occurred. As a matter of fact, only a few days before a car collided with the identical post, but not in such a manner as to seriously injure either the car or the occupants. There seems no doubt that the driver thought he had a perfectly clear road, and was keeping at a respectable distance from the fountain at the top of Sidwell Street, and the electric light standard close to it, on which two small lamps were alight.

On the Thames Embankment.

♦ ♦ ♦
 THE compromise which was effected when a grudging permission was given by one branch of the Legislature to the L.C.C. to run its trams along the Thames Embankment has produced a state of affairs which is not creditable to those responsible for the traffic arrangements of London. The electric cars now run close to the kerb on the side nearer the river, and the result is seen in the dangers to pedestrians that frequently occur. In order to mitigate these somewhat, there have been placed at six points along the Embankment wooden platforms in the roadway alongside the tramway lines. The object is to enable passengers and also pedestrians to take refuge from the press of traffic. These refuges are the outcome of a recommendation made to the Council by the police authorities, and three more platforms are to be added to those already erected. Although these devices have the appearance of being of a temporary character, there is little doubt that they will be replaced before long by permanent structures.

A Motor Marine Trip.

♦ ♦ ♦
 MOTORISTS having had many enjoyable excursions together on land, the question of organising a cruise by motor-boat has two or three times been raised. Nothing, however, has been done in the matter until at length the Motor Yacht Club contemplates the organisation of a cruise along the French canals, to take place in May or June. In order that this be successful it is necessary that at least ten motor-boat owners should agree to take part, and the secretary is now awaiting acceptances from that number for a ten days' cruise. The boats that are not large enough to cross under their own power will be carried over to Havre by steamer. The owners of the large boats will of course save their hotel bills by living on board their own vessels. Altogether the idea is one that is extremely feasible and should provide considerable pleasure should it become a realised fact.

Roadside Conveniences.

♦ ♦ ♦
 THE roadside telephone call-box may, as motoring increases, become a useful addition to the landscape. But the stretches of roads are so long that accidents may happen at points so distant from these instruments that they may be really useless. At the same time there are many places where their utility would be unquestioned—provided, of course, that their location was generally known to travellers by road. In this connection, therefore, mention may be made of the enterprise of Messrs. Mens and Co., of Boscombe, Bournemouth, who have set up a call box near Lyndhurst, on the London-Bournemouth road. This will be available to all motorists requiring assistance, whether by night or day, and suggests a new activity for those organisations which are concerned with the maintenance of the road for motorists. Already the various agents who have been appointed at villages and out of the way places have proved of service to motorists and steadily there is growing up an organisation—by associative effort and by private enterprise—which will considerably minimise any sense of insecurity that may have

been felt in the past; all this is to the advantage of the motor movement, assuring those who take up the car, whether for pastime or business, that help can be readily obtained in any untoward circumstances. The next move will be to persuade local authorities to give less encouragement to the police traps that rob many country places of prospective trade and popularity.

An Inconvenient Happening.

A gentleman residing at Herne Hill, and having City offices in Chancery Lane, invited some friends to dine at the Criterion Restaurant, London, whither he drove with two of them in a hired motor-car. Two other guests went in their own car, the drivers being instructed to return at eleven o'clock. At that hour the host came to the door and ordered his car to be brought up.

Police and Motorists.

At the annual dinner of the Yorkshire Automobile Club, at which Prince Francis of Teck represented the Royal A.C., an important speech was made by Major Atcherley, the Chief Constable of the West Riding. Unlike some of the police authorities nearer London, he is quite ready and anxious to co-operate with motorists in order to bring about a good feeling as well as a just administration of the law. As a first step he suggested something in the nature of a reconnaissance of the county in order to select the particular places where danger signals might usefully be located. In making such a proposal the Chief Constable was able to point to the county of Shropshire, where something of the kind has already been done. We would suggest that here is a piece of work which the provincial clubs generally might take up in conjunction with the Chief Constables. The indication of danger zones, where motorists should be more than ordinarily careful, is work that ought to be more generally encouraged by the authorities. Another good point made by Major Atcherley was to the effect that policemen were not taken

"Ancient and Modern."—A Dennis Turbine Fire Engine and First-Aid Machine alongside one of the oldest of Fire Engines, viz., a small manual pump, dated before 1700.

The photograph from which the above illustration is reproduced was taken at the Birmingham Central Fire Station by the courtesy of Chief Officer Tozer. The fireman in charge of the ancient "Fire Squirrel" is dressed in the uniform of the Hand-in-Hand Insurance Company of 1696.

Then he went inside to fetch the guests who were dining with him, and, returning to the entrance again, was amazed—rain was falling heavily—to see his car disappearing at a smart pace. Subsequently he ascertained that two gentlemen and a lady had come out of the restaurant while he was fetching his friends, jumped into his car, and ordered the chauffeur to drive to Liverpool Street station. The chauffeur did not particularly notice who had got in, and obeyed the instructions. On arrival at Liverpool Street one of the gentlemen inquired, "How much?" "Oh, Mr. — will attend to that," said the driver, who seems to have thought his employer was the other gentleman who had walked off to the booking-office. "Am I to go to Herne Hill," the chauffeur next inquired, and receiving the reply, "No, go home, my man," he went home. It is suggested that the persons who journeyed to Liverpool Street mistook the car, although an expensive one and handsomely appointed, for the useful taxicab. The incident, small in itself, is suggestive of the need of care being exercised by the man on the outside seat as well as the persons who enter within.

into the hunting field, and that something of the spirit which animated those who followed the Master of Hounds should be inculcated into those who form the motoring community. This will only be the case when the police act with impartiality.

FROM Messrs. J. Willing, jun., Ltd., comes Willing's Press Guide and Directory for 1909, a concise and comprehensive index to the press of the United Kingdom. The classification appears to be brought well up to date and the work easily maintains its reputation.

SOME interest has recently been aroused in motoring circles in connection with a report that the British representatives of the holders of the patents relating to the Mercedes cars, particularly as regards the "gate change," were about to make a demand for a royalty on all chassis fitted with the same. It was rumoured that notices to this effect were to be sent out on Monday, but they had not been issued, so far as we could learn, at the time of going to press.

THE NOTTS A.C. DINNER.

I ALWAYS look forward with pleasure to the annual dinner of the Notts Automobile Club, and hied me down to the City of Lace on Friday, last week, partly by road and partly by the Great Central Railway, whose station adjoins the hotel in which the banquet was held. Although fine it was a bitterly cold day, but this did not prevent many of the visitors coming on their cars. Among the first I met was Mr. Percy Richardson, of the Sheffield-Simplex Company, who had run over from Sheffield on one of the new gear-box-less cars, and who, like many others, was not loth to seek shelter near the warm fire.

NEEDLESS to say, the dinner was a brilliant success. A pleasant feature of the annual event has always been the presence of ladies, and, except that the toast list is perhaps already a trifle long, I should be inclined to think that Mr. Booth Granger, the hon. sec., owes them an apology for not including a toast to "the ladies" in the programme.

MR. FREDERIC COLEMAN, of White steam car fame, was in good form. "So full was he of 'yarns' he quite overlooked, in

I MISSED the presence of Mr. H. Bircumshaw, a popular member of the club, who was unfortunately not well enough to attend. Mr. Chas. E. Welles-Lucas, the hon. solicitor, was, however, as usual, the "life" of the little party which assembled in the smokers room after the dinner. During the last few years Mr. Lucas has been called upon to defend a large number of motorists in different parts of the country, and the stories he can tell of his "tussles" with the police are well worth hearing. By the way, Mr. Lucas gave me a very simple formula for quickly ascertaining the speed in miles per hour when a policeman swears you have covered so many yards in so many seconds. All that one has to do is to divide the yards by the seconds and multiply the result by two. A little calculation will show that the result, although not quite accurate, gives a very close approximation. By its means Mr. Lucas has on more than one occasion been able to show the magistrates how little reliance they could place on the policeman's evidence owing to the impossible speed he had sworn to—150 miles an hour in one case! I give the formula, as one never knows when it may come in useful.

ALTOGETHER the evening was a most enjoyable one. The success of the gathering was in no small measure due to the efforts

A Sheffield-Simplex Gear-box-less Car ascending Perloek Hill.

this speech, that the main object of it was to propose the toast of the R.A.C., an omission which, on it being jocularly pointed out by Mr. Julian Orde, was enthusiastically given. If you meet Coleman at any time, ask him to tell you the story of "The Accident, the Coincidence, and the Habit."

ONE of the chief features of the evening was the presentation to Mr. Chas. Hardy, the esteemed president of the club, who has been forced to resign the position he has so long held owing to his removal from the district. The presentation took the form of a beautifully chased Chinese silver vase over a hundred years old. I believe that Mr. Hardy intends to settle in the South, so that what will be the Notts A.C.'s loss will be a gain to the R.A.C. Lieut.-Col. Birkin is to be Mr. Hardy's successor at Nottingham.

IN Mr. P. S. Clay Nottingham has not only a capable chief constable, but an excellent after-dinner speaker, and his "turn" is always looked forward to with interest. Nor were we disappointed. Among many of his witty remarks one of the best was the reference to "the little list," which, like Gilbert and Sullivan, he keeps of motorists, and to which he intends to add the name of H.S.H. Prince Francis of Teck!

of the indefatigable hon. sec., Mr. Booth Granger. It is not generally known that this gentleman is an excellent amateur photographer, as may be judged from the fact that he carried off the first prize in the Photographic Competition organised by the Club last year.

ARCANUM.

AT Bawdlands, Clitheroe, Messrs. Slinger and Sons have a well-equipped garage where all classes of cars can be repaired. Body painting and trimming work is also undertaken and a large stock of accessories kept on hand.

THE prevalence of foot and mouth disease among animals has recently led to the enactment of a somewhat unusual prohibitive measure by the Canadian authorities. At the beginning of this month motor-wagons were refused permission to cross the ferry from Detroit to Windsor, Ont., it being charged that, as they have been doing a large business in the transportation of hides and other animal products, their service was a distinct menace to Canadian animal health. Motor vehicles of other kinds than those used for commercial purposes are only permitted to cross from Detroit to Canada after they have been thoroughly cleansed of mud and dirt. It is expected, however, that the quarantine measure will only be in force for a short time.

The Great Lakes of Connaught.

BY J. LL. WARDEN PAGE.

(Concluded from page 972.)

IRISH towns are seldom interesting, and there is little to see in Castlebar. Indeed, we only pass through it because it is *en route* for Lough Conn, the third of the great lakes of Connaught. To reach it we will take the road through Turlough, where there is a fine specimen of a round tower presiding over the ruins of another abbey, and thence, after winding over a moorland country, come in due course to Lough Cullin and the hamlet of Pontoon, if so it may be called, for it consists but of an inn, a cottage, and a police barrack, now unoccupied. "Why doesn't the Government let it instead of leaving it to fall into ruins?" I asked of a "bhoy." "Faith, they nivver know whin they mayn't want that same," he replied, with a grin.

Pontoon is delightful. The homely little inn stands on the very edge of the lake, with a rocky but well-timbered ridge at its

pleasant scenery of wood and water. It seems a prosperous little town enough and has a great name among fishermen, for the Moy is one of the best salmon rivers in Ireland. Over the long bridge and up the steep street our road passes westward to Crossmolina; and if Molina was a motorist I do not wonder that she was *cross*, for a horrid road it is and bumpy. However, in eight miles we have done with it, and, turning sharp to the left in the village street, head southward towards Nephin, which now rises magnificently right ahead. This is a give-and-take road with occasional stony patches; and it is lonely, but the scenery is fine. Mountain and moor spread out on either hand; occasionally there are glimpses of Lough Conn, now away to the left. Ere long we reach Coolnabinnia Police Barracks, and find a better road leading down the valley to Crumpaun

The Road on the Side of Sheffra Mountain, near Leenane, co. Mayo.

back, and a lovely little pass, through which another road, with which we have nothing to do at present, leads to Newport and the coast. It is a great resort of fishermen, who come after the pike for which Lough Cullin is so famous, and of which ferocious and gigantic specimens in glass cases decorate the walls of the dining-room. Those not bent on fishing might do worse than climb the ridge aforesaid, which commands a view of the whole of Lough Conn, from Ballina spire at the northern end to the single arch bridge close to Pontoon which spans the little channel between Lough Cullin and Lough Conn. And away to the westward, seemingly close by, though really some miles away, heaves up great Nephin, next to Mweelrea in Connemara.

From Pontoon to Ballina is but twelve miles, and the road for some distance runs close to the lake. It is a pretty good road on the whole, though there are some sharp little "pinches." Ballina lies a little beyond the north end of the lake on the tidal river Moy, in the neighbourhood of some

Bridge, at the head of Lough Belton, a small but pretty sheet of water. Hence an undulating road drops gradually to Newport, a village-town on a wooded estuary of Clew Bay. At Newport we strike the road to Westport, which is reached over quite a good surface. From Ballina by the way we have come it is nearly forty miles.

Westport is one of the most beautifully situated towns in Ireland. It lies in a wooded basin hard by Clew Bay, the blue waters of which are studded with innumerable islands. Over all soars the great cone of Croagh Patrick. But commercially Westport induces melancholy. It is another town over which Ichabod might be written. It tried for the Atlantic trade; built warehouses and mills, erected a mile or two of wharves. Alas! the Atlantic trade did not come.

We see more of these empty mills as continuing our journey southward, we take the winding uphill road that climbs over a shoulder of Croagh Patrick. They are depressing objects, and

we are glad to leave them behind for the moors and see once more the Connemara mountains cutting the skyline. This road to Leenane is liberal in the matter of hills. There is a hill of one in ten out of Westport, and another with a nasty twist in it abreast of Croagh Patrick; but, once away at the back of the mountain, all is plain sailing. The road runs down the wild Erriff Valley, the scenery, especially at Erriff Bridge, being very fine. The dark mountains to the left are the same that we saw from the other side of Lough Mask, which is now only seven miles away as the crow flies, though the crow would have to fly pretty high to clear Maamtrasna, Benwee, or Devil's Mother. The Devil, by the way, is much in evidence in Irish place names. We know of a Devil's Punchbowl, a Devil's Glen, a Devil's Ladder, and divers other places or objects with which Satan appears to have been connected. "The Devil seems to own a good bit of Ireland," remarked an English tourist. "Yes, yer honour, but shure he's an absentee landlord," was the reply. And that tourist will think twice before "taking on" another child of Erin!

A little beyond Devil's Mother comes Leenane, at the head of that long arm of the sea known as Killary Harbour. It is shut in by dark mountains, and the surroundings generally are, I suppose, the finest in Connaught. But what strikes us most is the presence of a finger-post—the first we have seen! The

The Right Hon. Earl of Dudley, P.C., G.C.M.G., G.C.V.O., landing at Fremantle to take up the duties of Governor-General of Australia. The car which he is about to enter is a Daimler, which was placed at his disposal by Mr. Richard Strellitz, of the well-known shipping firm of that name, and was used for a trip extending over fourteen miles, after which His Excellency expressed himself as highly satisfied with the vehicle.

characters are in Gaelic, and therefore absolutely useless to the Sassenach, and indeed to most Celts. But what of that? It is a finger-post undeniably, and finger-posts in the West of Ireland are about as plentiful as pineapples at the North Pole. Long life to it!

We ascend the hill behind Leenane and find ourselves at the mouth of the valley that runs right down to Maam and Lough Corrib. For we are approaching Lough Corrib again, and at Maam Bridge meet the road coming down the pass along which we travelled a day or two ago. For this has been a "circular tour." This road through the Maam valley runs at the very feet of the Maamturk range, a bold, rocky rampart. There is an inn of sorts at Maam Bridge, but most motorists will prefer the hotel at Recess, which lies up the pass and round the corner, on the road from Galway to Clifden. This is about the best hotel in the country, and Recess quite a charming spot at which to be benighted. Here, amid lovely surroundings of mountain, lake and woodland, we will make our last halt ere tackling the thirty-five miles of highway that lie between Recess and Galway.

ON THE CARE OF A CAR.

MOTORISTS too seldom take a systematic record of the expenses in connection with their automobiles. And yet it pays to take great care of the car, for whatever is lost or broken will be found in the bill.

My golden rule is to keep a book, which I call the Car Book, showing the following:—

- 1st.—When batteries were charged last.
- 2nd.—When tyres were renewed or re-treaded.
- 3rd.—When valves were ground.
- 4th.—When dirty oil was run out of crank chamber.
- 5th.—When gear-box was examined and oil added to make up for what has wasted or leaked out.
- 6th.—Number of miles run each trip.

These may seem small matters, and many, I daresay, do not or will not trouble to take note of these things; but it is the little things that count in the end, and if the motorist does not keep a note of when these things want doing, there will soon be trouble.

I carry this system further, as I note in my car book where the spare parts, various tools, &c., are kept, so that I have not to turn the car upside down to find something that is wanted in an emergency. Beginners I would recommend to do as I did—that is, to make out a list of what they must do before they start their engine to go out for a run, and fasten this list just inside the lid of their tool-box, so that they can see it when they go to get their oil can to oil up. Novices will find this list worth a Jew's eye to them, as it will keep them from forgetting something that might cause their engine to overheat and spoil it. And it is astonishing what a much greater confidence a beginner has when he knows everything is in order.

Now with regard to the upkeep and cost of running a motor-car it should be noted that these will vary:—

- 1.—The greater the number of cylinders, the greater will be the amount of petrol and oil consumed, though with extra cylinders a steadier running and quicker going is obtained. My car is two-cylinder, and consumes one gallon of petrol to eighteen miles.
- 2.—The heavier the car the more petrol there will be used, and the greater the wear on tyres. But heavy cars are generally stronger than light cars, and, therefore, last longer.
- 3.—The car with high engine power and high speed is more destructive on tyres, and will also cost more in repairs, petrol, and oil.

It is clear that if speed is wanted it must be paid for like all other "luxuries." But if expenses are to be kept down, and we are content with a moderate speed, we can go in for a good make of a one or two cylinder car. There are many of these on the market, and I think that the small well-made car will be the car that will stay longest. But a cheap car is dear at any price, for what is saved in first cost is spent later in repairs.

From experience, I find that a general repair should be made once in two years; also that a set of tyres should last two years. So, on these lines, I have in yearly upkeep and actual running cost only debited half of the cost of repairs and half the cost of tyres. On these lines, my costs work out at 4½d. per mile, not including capital charges, nor for cleaning and looking after, as I do this myself. I would say to those about to invest—Don't let these figures frighten you; for much of my travelling is done in climbing up the mountain roads in the Isle of Man, where I have to keep on the low gear a good deal. Much better results could be got on good and fairly give-and-take roads.

G. GILLMORE, Hon. Treasurer of the Manx A.C.

THE transport of mails from the steamer at Bombay to the General Post Office and railway station is usually done by bullock carts, but for the Christmas service a Renard road train was employed and the mail, consisting of over 1,200 large boxes, and letters and parcels weighing 90 tons, was conveyed in remarkably quick time so, that all the up-country trains left to time, almost an unique experience at that season of the year.

GOSSIP FROM PARIS.

An Aero Fete for the Benefit of the Earthquake Sufferers.

The Aviation and Steerable Balloon Fete which it is proposed to organise at Longchamps, Paris, in favour of the victims of the earthquake in South Italy and Sicily is a captivating idea, but unfortunately its success must depend on the condition of the atmosphere, which is fickle. M. Georges Prade, of "Les Sports," the author of the project, which is placed under the patronage of the Paris Press Syndicate, is an enthusiastic supporter of the aviators, who, he is sure, will go to Longchamps to show their machines in flight with as great eagerness as they exhibited them in the Salon. He is certainly not mistaken in counting on them to aid to the best of their ability in obtaining as large a sum of money as possible to assist the very many thousands of survivors of the cataclysm which laid waste a vast region and destroyed so many towns and villages. But there are serious objections at least to the date of January 24th suggested for the fête. It would be scarcely possible to make the necessary preparations in so short a delay. Moreover, I have heard several aviators express regret that the idea was started, because they fear it will either be found impracticable, or that it will result in a poor show in so far as the aeroplanes are concerned. It is possible the steerable balloons may come from their sheds outside Paris and circle over the heads of the public assembled at Longchamps, on condition, however, that the wind is not blowing a gale. But the aeroplanes cannot yet perform a similar feat. If they are to fly at Longchamps they must in the first place be brought there and then be protected in sheds or great tents before and after the performance expected of them. The construction of the necessary sheds would be costly, and it would occupy a considerable time to put up the tents. Then, again, how many aeroplanes are there in France which have already flown and can be relied upon to repeat the feat at a given moment, even if the weather is calm? And it so happens that it seems likely the two most celebrated aviators will, notwithstanding their good-will, find it impossible to participate in the projected fête. Wilbur Wright's machine is at Pau and Henry Farman's is sold. Their absence would be regrettable, but if only the other aviators succeeded in showing off the qualities of their flying machines the public would be satisfied. Were it possible for Wilbur Wright to bring his machine from Pau, he alone would astound a million or more spectators, who would not much care what the other flying men might achieve or only attempt.

The Farman Aeroplane Sold.

Henry Farman has sold his aeroplane! It will be interesting to see whether its present owner will achieve as great feats with it as the English aviator did. Be that as it may, Henry Farman has undertaken to teach a man to fly with it, and declares his machine is so easily managed that it will not take him more than two or three days at most. Why did he part with the aeroplane with which he earned such world-wide renown? I put that question to him, and his explanations were to the point. He said that since he established his aeroplane shed on the Chalons camp he had used the machine for all sorts of experiments. He had transformed it successively in numerous ways, sometimes into a triplane, at other times into a biplane with reduced length of wings, &c. He had tried it with motors of various horse-power and with and without *ailerons*—that is to say, surfaces destined to produce the same effect as Wright's system of twisting the wings. In fact, he considered he had learned all that could be learned with the aeroplane, which he had from the first regarded as nothing but an experimental machine. He therefore accepted one of the numerous offers he had received to buy it. Even before disposing of it he had commenced the construction of a second aeroplane shed at Bouy (Chalons) because he was determined to set to work at once building two new machines. Both of them will be biplanes, but very different from his original aeroplane. That machine in its smallest biplane form had 32 square metres bearing surface, which was increased to 64 square metres by the addition of the third plane. The speed attained varied between 40 and

80 kilometres an hour according to the larger or smaller bearing surface, the larger or smaller horse-power of the motor employed, and the larger or smaller propellers. The two new biplanes, one of which will be completed about the end of February or in the first fortnight of March at the latest, will contain many improvements and be driven by motors of 56-h.p. and 40-h.p. respectively. It is almost certain both of the machines will be provided with skis, similar to those employed for the Wright Brothers' aeroplane, to enable them to alight without accident on very rough and broken ground. No catapult will, however, be required to start Farman's new aeroplanes.

A Warning to Tourists in France.

An English motorist who this time came by train to spend the New Year week in Paris, and who is contemplating a tour through France in the early spring, asked me whether it was really true the system of drawing up *procès verbaux au vol* for excess of speed had been abolished. I was, unfortunately, unable to reassure him completely, because, though M. Lepine, the amiable Paris Prefect of Police, has strictly prohibited the practice in the department of the Seine, there are numerous other departments in which the municipalities have not followed his example. I should be sorry to think the mayors of those country towns wilfully set traps with the object of filling the coffers of the township with the often undeserved fines imposed on unwary motorists. But it

Wilbur Wright, the Flying King of 1908.
L'Industrie Velocipedique et Automobile.

has been demonstrated over and over again that at certain moments the gendarmes are, so to say, mobilised especially to take the numbers of the motor-cars as they pass. The official wearing the cocked hat, often concealed behind a tree, does not, as a rule, trouble to stop the vehicle, though he could do so by simply raising his hand, but contents himself with simply making a note indicating his estimation of the speed. Sometimes, but not always, he is assisted in the calculation by another gendarme posted on the road at a distance varying between a quarter of a mile and one mile. In either case it is much the same thing. The calculation is invariably against the motorist, though generally wrong. The unfortunate tourist, the victim of—well, I will call it "the unintentional error," is not given the possibility to prove the gendarme's mistake, because he is allowed to go on his way unconscious that the *procès verbal au vol* has been drawn up. It is not till some time later, when he may have even forgotten he ever passed that way, he learns he did so on a certain day and at a certain hour at a speed "endangering the safety" of the other users of the highway. The arbitrary decisions of the mayors limiting the speed of motor-cars in their respective communes, and the unfair practice of prosecuting people for alleged offences they are not even warned they have committed, make the tourists in France, whether they be Frenchmen or foreigners, pray for the prompt adoption of M. Barthou's promised reform of the legislation on highway traffic, which will, it is anticipated, unify the rules and regulations throughout the whole of the country and prohibit everywhere the *procès verbal au vol*. MARNEY.

THE SOCIAL WHIRL.

H.S.H. PRINCE FRANCIS OF TECK is proving a most devoted chairman of the R.A.C., and a worthy successor to the enthusiasts who have preceded him in that office. Last week he attended the dinners of two provincial clubs; he will similarly honour our friends across the Border at the annual gathering of the S.A.C. His engagements for the summer are already becoming numerous and the *bonhomie* of the Prince will make him a welcome guest at the provincial meets of the Club. At the Yorkshire Club's dinner he had a great reception, being welcomed with musical honours, which were almost renewed when he promptly accepted the hint previously conveyed by Mr. A. E. Masser that His Serene Highness would find much enjoyment at the club's annual gathering at Saltburn. Mr. Robert Armitage, M.P., was among the members of the Yorkshire A.C. who attended, while the Somerset A.C. and the Barnsley A.C. were also represented.

SOME idea of the increased reliability of motor-cars was conveyed to the minds of motorists who attended the Yorkshire Club's dinner by the reference to his own motoring career by Major Atcherley, the Chief Constable. He said he had been a motorist six or seven years, and "I was practically under my car for the first two years and in it at times for five years."

Motoring to the Hunt.—A scene at the Meet of the Southwold Hunt at Spilsby.

I LEARN that the committee of the Irish A.C. have decided to offer the post of vice-president of the club, rendered vacant by the death of the Earl of Drogheda, to Lord Northcliffe.

SHERRINGTON MANOR is a magnificent mansion at Selmeston, a pretty little village about ten miles from Eastbourne and seven from Lewes, where resides Mr. Cecil Chandless. Mr. Chandless is a motorist and his garage is not many feet away from the house. On Saturday evening his chauffeur was overhauling his 30-h.p. *Metallurgique*, being at work in the pit with a portable electric light. Without any warning the globe suddenly broke and the floating petrol vapour was ignited. Instantly the car was enveloped in flames. The chauffeur's cries attracted the attention of an electrical engineer, who was near by, and with commendable promptitude he liberated the unfortunate chauffeur. His action and presence of mind undoubtedly saved Westlake's life. The roof had already caught fire, but it was quickly extinguished by means of buckets of water. Two other vehicles were got out before much damage was done, but the *Metallurgique* was destroyed.

MR. A. HUNTLEY WALKER, whose garage at Hayes was destroyed by fire last week, has received an anonymous postcard,

bearing the London postmark, and couched as follows:—"Glad no one was hurt, but not less glad that there are fourteen less infernal machines—wish it was 14,000. Motors and most motorists are a curse to the country." What of anonymous correspondents?

It is hoped that the pleasure the motor-car is affording the Chancellor of the Exchequer during his holiday on the Riviera will increase his enthusiasm for the automobile. At Cannes he is motoring daily to the golf links, some six miles away from the Riviera Palace Hotel, where he and his family are staying. He has also been motoring along the good roads of the district and generally proving that the motor-car is one of the greatest economisers of time that has lately been introduced. Surely, after such an experience, Mr. Lloyd George will be chary of any temptation to harass its progress by increased taxation.

ON the last Tuesday in 1908, when the snow fell so heavily, only three cars were reported to the A.A. as having gone through from London to Brighton; on the following day seven were reported, as compared with the usual number of about a hundred a day.

AMONG Lincolnshire motorists none are better known than Sir Hickman Bacon, Bart., the premier baronet of the country, whose interest in motoring has been of more than an academic order. He is practically acquainted with the interior of some of the largest motor works in the Midlands, and he generally spends his vacations on the car. After several weeks in Ireland during last autumn he came to the conclusion that the roads there were very good; certainly an improvement on many that were traversed at the time of the Gordon Bennett Race. He was particularly struck by the scenery of the valley of the river Slaney, and is one of the British motorists who have been faithful to the Emerald Isle so far as the holiday season is concerned.

MISS CHARLESWORTH has provided the papers with an exciting sensation at a time when the Parliamentary recess has left them with columns to fill. The young lady seems to have been an enthusiastic motorist, *au fait* with many types of cars and also conversant with the firms that supply accessories and clothing. Thus the "Daily Graphic" gravely reproduced a photo of her motor hat with the name of Dunhill upon the lining, and another paper declared how she motored in the snow from Perth to Wigan, "using a stock of petrol obtained with a part of the proceeds of a diamond brooch pledged with a pawnbroker." She obtained her chauffeur from the Daimler Company, and the family solicitors also render similar service to the Automobile Association. Altogether the mystery provides opportunity for a real motoring novel, and one wonders whether Mr. and Mrs. C. N. Williamson or Mr. Gerald Biss will be first in the press with the same.

THE Hon. W. W. Vivian, of Bangor, had an almost providential escape from serious injury the other night. Motoring from Ogwen Lake towards Bangor he suddenly, just on the Bangor side of Ogwen Lake, crashed into some unseen but powerful obstacle. On stopping the car, it was found that two or three huge boulders had fallen from the mountain side, and it was with these Mr. Vivian's car had collided in the dark. Though the car was somewhat damaged no one was hurt.

AMONG those who accepted invitations for the first annual dinner of the R.A.C. and its associated clubs on Thursday was the Earl of Kimberley—a keen motorist and the son of the late Earl, who led a political party in the Lords for so many years. The first occasion I met the present holder of the title was a few Easters ago, when he was motoring in the west, making the County Down Hotel, at Clifton, his headquarters. Few more favourable centres for really interesting automobile excursions could be found. There are trips to be enjoyed to Cheddar, Weston-super-Mare, and, a little further afield, the glorious valley of the Wye. The Earl of Kimberley's home is in Norfolk, where he takes an interest in matters of local government and stands up for the rights of motorists upon occasion.

LOLLIUS.

SOME ROADSIDE DILEMMAS, THEIR CAUSE AND SOLUTION.

THE easiest, but rather humiliating, solution to a *panne en route* is to carry a long rope, and when trouble comes to search for either a passing kind-hearted fellow-motorist or to hunt for a horse, but either method of obtaining a tow usually goes against the grain, "Most of us have been through it," and then

"We felt to madness, but the full heart gave
No utterance to the ineffable within;
Words were too weak; they were unknown; but still
The feeling was most poignant."

But these little tribulations have their advantages; they teach one to know one's griefs, and "pride" comes in, and does more, it often suggests a way out, without having recourse to the rope. In looking over my diary of more than ten years' motoring at home and abroad with a view to narrating a few of my friends' and my

was in sight, so we took off the now V-shaped rod; it was a tube, and by fixing it in the fence we managed to return it once more to approximately its correct shape. The rod was then replaced, the chain put in position, and letting the clutch in this time with care we once more took to the road. Alas! straightening steel tubes cold is not much good; before we had proceeded another quarter of a mile it resumed its former misshape, and again the chain was flung. It was late, as I have already remarked, and we had had no tea and desired to reach London for dinner. It was clear the tube would not hold as it was, and then an idea struck us. We cut the tube in the centre with a file, after bending it once more straight; we then cut with our pocket-knife a bit of wood out of the fence, the length of the tube, this we made more or less round, and forced into each end of the tube, so that we had a tube of the right length with an inner lining of wood. We then drilled a few holes through the tube and wood with a hand drill that we luckily had with us, and through these we put a few bolts and fixed them with nuts, and in addition we wound the whole

Touring in Brittany.—The Chateau de Josselin.

own misfortunes, the dialogue between Gobind, the eighty-year-old one-eyed Indian, and Rudyard Kipling, mentioned in the latter's "Life's Handicap," comes to my mind. Like him, I write "of all matters that lie within my understanding, and of many that do not," but chiefly of the things that my friends and I have seen and experienced together. May my readers' knowledge piece out my imperfections, and if my plain tale appeal to similar casualties to theirs, the piecing out process may on some future occasion prevent time being lost.

It was on that popular Brighton road; we were on an excellent little car, one of the old 6-h.p. single-cylinder Wolseleys, and had stopped on Bolney Hill to gather some tempting primroses. On starting—it was on an incline—I must have let the clutch in rather sharply; there was a growl of anger from the car, and we started, not forward, but backwards. The brake soon stopped that, and then the chain was seen to be trailing in the dust. A torque (distance) rod had not relished the fierce clutch and had bent, and so the back axle was no longer at the right distance from the gear-box and the chain came off. It was late, no one

tube from end to end round with string. This held, and we reached home without further trouble. The moral seems to be, to let in the clutch with care; if it is fierce, spin it in the lathe, and afterwards castor oil it; also carry some spare bits of tube, a blow lamp, some solder, and a hack saw. The latter would have cut the tube better than a file, and a piece of tube sweated in might have made a better job than did the piece of stolen wood.

On another occasion, while in Somerset, on a two-cylinder vertical-engine car, an inlet valve spring broke. The fault was soon located and a new one put in. Still the car was weak; compression was good, but the car would hardly climb even a little hill. The cause, after a time, was found to be that the new inlet valve spring, though the same length as the other, was stiffer, so that the valve did not open as quickly as the other and its cylinder did not get a sufficient charge. Cutting off one turn of the spring effected a cure. It also taught me for the future to know what weight should lift the valve, and to see that this test was applied before a new spring valve was put in. On most cars $1\frac{1}{2}$ lb. to 2 lb., when put on the top of the stem, should

lift the mushroom off its seat, but this, of course, varies with the compression. With new rings inlet valve springs must be weaker.

Speaking of valve bother reminds me that—I suppose most men know it now, I did not in my early days—there should always be room to slip a piece of thin paper between the exhaust valve stem and its tappet. When valves are repeatedly ground in they sit a wee bit lower, and so, when they get hot with running, may be kept from closing by being held up by their tappet. The treatment is—if there is an adjustment—adjust the tappet so that there is room for the piece of paper between the two, or file one of them, so that there is. On cars with laminated exhaust valve springs it is as well, in cases of loss of power, to see that one of the spring leaves is not broken. I found this to be the source of worry on a Wolseley once, but I had looked at many other possible causes before I chanced on this, the real one. Valves, too, may be held up through the valve or tappet guide being worn or gummed with burnt oil. These guides do not, I fear, get the cleaning they deserve; the stems, too, like an occasional rub over with graphite; doing this may obviate a roadside stop, and the worry of a diagnosis.

Piston rings, of course, are as a rule fitted at home, and generally when new ones have been put on the piston the compression is poor, and the running for the first few days the reverse of pleasant. A good way to avoid this is, after fitting the rings, to

The Hon. Lionel Walrend's 28-36-Daimler Car after the accident last week. From a snapshot in Messrs. Gould Bros. Garage, at Exeter.

take the valves out, and by means of a leather belt run the flywheel off some engine shafting, and to do this, if possible, for a day, of course keeping the piston and rings well lubricated all the time with "thin" oil. This beds them in and makes the first trip on the new rings much more pleasant. In most neighbourhoods there are some works where, for a trifle, permission to do this can be obtained.

Probably the chief cause of roadside stops, after ignition torts, are the result of a fierce clutch. Leather-faced clutches still seem popular, and really answer well providing they receive an occasional dose of castor oil, or, what is better, Collan oil. If the clutch is still fierce, and there is time to take it down, it is a good plan to file three recesses on the male part under the leather, and to slip in three bits of watch spring. These cause a slight bulging and thus a gradual engagement. I remember once being hung up in Norfolk by a sheared-off crown wheel, which was solely due to a fierce clutch. The three hours we spent on the road taking down the gear-box and rebolting the large bevel to the differential sleeve impressed me greatly with the need of a gentle clutch. Still, it was done on the road, with six odd quarter-inch bolts which had to be held in a shifting spanner while their heads were filed so that they could sit in the differential sleeve flange. The conclusion was that we wished we had had a vice fixed to the step of the car.

Ignition torts should not cause a road stop, but what should be is not always the case. If the electric leads are well insulated and supported, the accumulators kept charged, and the coil

trembler or make-and-break platinum points are kept clean and adjusted, there should not be much trouble. Still, wires do break, and it is as well to carry spare cable and some insulation tape. The latter is also of use if a rubber water joint "plays up."

Steering gear bother once made me rather warm. We were near Royston, in fact descending that hill, when we noticed the car wobbled. Examination showed a break in the rod joining the two front wheels, which was temporarily spliced by slipping in a small box spanner drilling holes in the tube, where the tommy holes were in the spanner, and so with bolts making the tube once more solid. What was more unpleasant was, once, while up north, the ball end of the steering rod slipped out of its socket. Nothing occurred, but it might have. The nerve shock resulted in our now using leather covers for these joints, and, in addition, we always inspect and oil them before going out.

I suppose everyone has been held up at some time by a choked jet in the carburettor. We thought we would obviate all this in our latest motor and had a petrol filter fitted; it answered splendidly until the gauze strainer became choked late one night when on the way home from Bexhill. Taking the gauze out by lamp-light made us rather sorry that we were not insured against fire. The lesson was, carry an electric torchlight, also to occasionally clean the strainer, which is more easily done in the garage than on a muddy road. A spare full can of petrol has its merits; we learnt that lesson by walking two miles for some, and it was driven home by the rain and the absence of an umbrella!

Most, in fact all the cars we have had or been in, have been able to make us understand when they were hungry for lubricant, and, as luck would have it, either their smell or knocks have always saved us from the disgrace of a halt due to want of oil. Still, it is a good thing to keep the glasses of the drip lubricators clean, so that a glance can show whether the oil gets into the pipe that leads, as the case may be, to either bearing or crank. We also have discovered why exhaust pressure lubricators are being supplanted by the pump variety. To get the pressure pipe off the exhaust and clean it may burn fingers as well as cause unparliamentary language. We once had a hot engine that "yelled" for oil, and we satisfied its cravings by pouring oil down the air vent into the crank case. It was impossible to clear the pressure pipe with the tyre pump, it had to be done with heat and a blowpipe at home, and then there was trouble.

Once in France we met a man stranded as a result of a choked exhaust box, but he had found the cause and was cleaning it when we stopped to offer, in bad French, our aid. We saw that box undone! It did remind me of my boyhood and the conjuror we used so to admire; he honestly took out as many odds and ends as the conjuror did from a top hat.

Our pride once made us drive four miles on that little 6-h.p. Wolseley with a cracked crank shaft; the brasses held it together; it was broken in the pin. It would have been cheaper to have hired a horse, for it spoilt the brasses. Still, with loud knocking noises we reached home.

A broken spring, of course, need cause but little delay, now that proper first aid splints with clamps are sold, but a similar arrangement can be improvised out of two tyre levers and a couple of clamps. The ones that carried us home from near Canterbury once were the property of a cook, who used them to keep his mincing meat machine on the kitchen table; and that reminds me, if I were writing some "Golden Rules" to stick up in a garage, the first one would be lubricate between the spring plates once a month and the shackle pins every week, also see that the nuts of the spring clips are tight; the working loose of these is a common cause of a broken spring.

C. T. W. H.

WHEN it becomes necessary to descend a very steep hill, it is best at the top of the hill to engage the second or first speed, even though the brakes are supposed to be sufficiently strong to hold the car on any gradient. With the low gear in mesh, if the brakes do not hold, by simply letting in the clutch the engine will be found sufficient, if not to stop the car entirely, at least to retard its motion to a safe limit.

THE NEW BRITISH ARMY AEROPLANE.

ON Saturday the new British Army aeroplane made a flight of about twenty yards at a height of about 10 ft. from the ground. Two days previously the machine had been taken from the Balloon Factory at Farnborough to the adjacent golf links for a test along the ground. It is 40 ft. in length, 3½ ft. wide, with a space of about 7 ft. between the upper and lower planes, the latter being concave and sloping from front to rear. In the centre of the aeroplane are the 50-h.p. engines with the propellers almost flush with the front of the planes. A difference compared with the Army aeroplane that came to grief at Aldershot some months ago is seen in the removal of the radiators to the rear of the steersman's seat. Running out behind these is a 10 ft. frame carrying a square of canvas, another being fixed in front of the engines. The three lifting planes suggest, however, the most notable innovation. These are operated independently of each other. The central one is 20 ft. long, those on either side being about 5 ft. in length. They project fully 12 ft. in front of and midway between the superposed planes, being fixed on a bamboo framework which allows them to be depressed or elevated at an angle to the aeroplane itself. The

THE WARFARE OF THE FUTURE.

IN the course of a recent address before the American Chemical Society on the subject of "The Warfare of the Future," Mr. Hudson Maxim remarked that, "Now that the flying machine has become an actuality, and as all that now remains to be done is to perfect already existing means and apparatus in order to complete the conquest of the air, it is well to forecast some of the adjustments that will be necessary to meet the changed conditions when we shall have our aerial navies of commerce and of war. That the flying machine will find very wide application in future warfare there can be no doubt. Furthermore, it will be the demand for the flying machine as an engine of war that will give to the industry its greatest stimulus. Some terrible things have been predicted for the flying machine as a war engine. Many a sanguine inventor has claimed that with the advent of his flying machine battleships, coast fortifications, and cities could be utterly destroyed by dropping dynamite from the air. It is comforting to know that no very great loss of life or property would result from dynamite dropped from flying machines, for the reason that dynamite requires confinement to work very wide destruction. The flying machine will have very great use in war as a

The New British Army Aeroplane.

machine is supported on a light chassis mounted on four bicycle wheels. On the Thursday Mr. S. F. Cody occupied the seat and demonstrated the easy response to the steering gear. Two days later, as we have said, it rose from the ground to the satisfaction of Mr. Cody and the officers in charge. The experiment of placing the radiators so far behind the operator's seat, however, disturbed the balance, and when these have been moved nearer the centre a further trial will be undertaken.

At Tuesday's Congress the representation of national organisations on the Federation was discussed, and it was decided to allot votes to each country in three sections—spherical balloons, dirigible balloons, and aeroplanes. With regard to the first-named the existing system will remain, the votes accorded on dirigible balloons will be commensurate with the net tonnage lifted by the vessels of each country that have during the year travelled not less than fifty kilometres in a circle. With regard to aeroplanes, the basis of representation will be on the number of effective machines that have covered during a year one kilometre in a straight line. A maximum of twelve votes for each section was decided upon. It was agreed to found a prize fund of nearly £50,000 for dirigible balloon and aeroplane competitions. The next conference will be held in October.

scouting craft for the purpose of locating an enemy and inspecting his position; but the enemy will have his aerial pickets out too, and there will be many a tilt in the air between the warring craft. Then it will be that speed will count for much, and there will be intense rivalry between the nations in the production of flying machines that will fly fast and fly high, for those able to fly the highest will have a tremendous advantage over their enemies. It will be the high flyers that will win. In the not distant future we shall have our automobiles of the air, and in the wars of the future we shall have our aerial battleships, our cruisers, our torpedo-boats, and torpedo-boat destroyers. Although the value of the flying machine in future wars will be mainly as a scouting craft, still its value and importance for that service alone is hard to over-estimate, for the flying machine vedettes will be at once the eyes and ears of the armies of the future; and they will have their use in naval warfare too, for there will be the aerial torpedo scout on the lookout for torpedoes and torpedo-boats, which will signal the approach of danger.

A SPANISH aeronaut, Senor Luiz de Palacio, has designed a new two-seated aeroplane fitted with a 50-h.p. engine, with which he intends to shortly carry out some trials in the neighbourhood of Paris.

AERONAUTICAL NOTES.

THE Asociacion de Locomocion Aerea is the name of a new society which has been formed at Barcelona.

SOME trials are shortly to be made at Jemappe-sur-Sambre, Belgium, with a new aeroplane designed by M. J. Lepouse.

IT is announced from Berlin that Herr Hans Jorch, of Mayence, has succeeded in flying a distance of 20 yards with an aeroplane built to carry two persons and a large supply of petrol.

IT is reported that the Frankfort firm of August Euler has acquired the sole right of manufacturing in Germany aeroplanes on models at present owned, or in future possessed, by Messrs. Voisin Frères, of Billancourt, near Paris.

M. RENE GASNIER, of Angers, France, is rebuilding the aeroplane which met with an accident last summer. The reconstructed machine will be of the biplane type, and when finished will weigh about 10 cwt.; it is being fitted with a 50-h.p. Antoinette engine.

IT is proposed that the Eiffel Tower in Paris shall be used for the purpose of testing the stability of models of aeroplanes, by allowing inventors to use the top platform of the tower as a place from which they can allow their models to glide or otherwise fall to earth.

THE Aero Club of Belgium, which is contemplating publishing a map showing places where flying machines can safely land, has written to the mayors of all the towns and villages in the country asking them to point out any open spaces in their areas suitable for such purpose and having an area of at least 2,600 feet by 1,300 feet.

MR. WILBUR WRIGHT will remain for about a month at Pau, where he is being joined by his brother, Orville Wright. After instructing a number of pupils there he will return to America, in order to complete the official trials of the Wright machine which were cut short by the accident last year.

THE French Society for the encouragement of aviation announces that Mr. Wilbur Wright has agreed to give at an early date a series of demonstrations in flight at the new aerodrome at Juvisy, and that the proceeds of the exhibition will be handed over to the fund for the earthquake sufferers in Italy and Sicily.

THE date for closing entries for this year's Gordon Bennett race has been postponed from February 1st to March 15th. The rules of this contest are to be altered as the progress in flying machines may dictate, and on Tuesday the Federation decided that "(1) Heavier than air machines must accomplish a fixed circuit, having a perimeter of from five to ten kilometres, a total distance of not less than 20 kilometres; (2) machines may touch the ground, or land during the circuit, without being thereby disqualified." A large number of entries is expected.

THE Conference of the Fédération Aéronautique Internationale was begun at the Ritz Hotel, Piccadilly, London, on Monday, when thirty-six delegates attended, representing the United Kingdom, France, Germany, Belgium, Spain, and America. Owing to the ill-health of Prince Roland Bonaparte, Mr. Roger Wallace, K.C., was elected as president and occupied the chair on Tuesday and Wednesday. M. Besançon, the general secretary of the Federation, was similarly absent and his duties devolved upon Mr. H. E. Perrin. Practically the whole of the first day's sitting was devoted to England's appeal against the award in the last Gordon Bennett race. During the discussion Comte de la Vaulx acted as chairman, and at the close the following statement was issued, "That the International Conference, meeting to decide the winner of the Gordon Bennett Balloon Race, declares: That having taken note of the official award of the German Club whereby

Colonel Schaeck, exclusively on a point of law, was declared the winner, that having considered the various proposals submitted to the meeting, some of which suggested that the first place should be awarded to Mr. John Dunville (the British representative), and that Colonel Schaeck should be disqualified, regrets That the obligatory interpretation of its rules prevents the Conference from giving retro-active effect to the decision of May 27, 1908; and also regrets that having before him the propositions put forward in a perfect spirit of sport by the Aero Club of the United Kingdom, Colonel Schaeck should have expressed willingness that the first prize should be awarded to the club that protested against him, provided that he himself were awarded a place in the race, and to accept the division with Mr. Dunville of 12,500 fr. This attitude is deplored by the Conference, which, nevertheless, accepts the classification of the German Club."

ALREADY nine entries have been received for the aeroplane competition which is to be held at Monaco from the 24th inst. to March 24th; they comprise three Antoinette monoplanes, entered respectively by Lieut. Bourgeat, M. René Demanest, and the Antoinette Company; three Voisin biplanes—two by M. Delagrangé and one by Baron de Caters. A Breguet-Richet gyroplane and a Breguet biplane by M. L. Breguet, and a Vuitton-Hubert helicopter by M. G. Vuitton. The regulations for the competition show that prizes of the value of £4,000 are being offered. The competitors will be required to pass over, in flight and without touching ground, the line of jetties closing the harbour of Monaco, to cross over the sea, round the red and white flag of the International Sporting Club of Monaco planted at the point of Cap Martin, and then return by the same course, passing again over the jetties. The length of the course is about six miles. The aeroplanes must be provided with some means of keeping them afloat. Competitors can make as many attempts as they wish between 10 a.m. and 5 p.m., but must advise the committee before 9 o'clock in the morning. The main principle of the competition is that the prizes will be awarded on the aggregate time for three flights of the course, the fastest taking the first prize, which is of £3,000, the next best securing the second prize of £600, and the next the third of £400.

ON Monday Mr. Orville Wright arrived at Plymouth on his way to join his brother in France. He hopes to be back in the United States in the spring, to carry out their contract with the Government, the conditions of which must be fulfilled before June 28th. They have to make one flight of an hour, as well as another full-speed test. If they attain forty miles per hour they get 25,000 dols., whilst if they can fly forty-four miles they will secure 35,000 dols. Asked as to whether the ultimate conquest of the air by man was at hand, Mr. Wright said the future lay with aeroplanes, by reason of the fact that they were of smaller size, and were more easily controlled than the dirigible machines, although the latter would have their distinct uses. "I do not," he added, "agree with the opinions of some that the aeroplane will soon come into use as a commercial vehicle. Other modes of transport are so much cheaper that on a purely commercial basis the aeroplane would have no show. There can be no doubt whatever that in a few years heavier-than-air craft will become common both in Europe and America."

AN aero section has been added to the Belgian automobile exhibition, which opens in Brussels to-day (Saturday). In addition to a large number of models, the exhibits will comprise Baron de Caters' triplane with Vivinus engine, Baron Pierre de Crawhez's monoplane, an orthoptère by M. Adhemar de la Hault, and an aeroplane with Pipe engine belonging to M. Fleming.

Monsieur A. Clement and his Atrahip.
[From a caricature sketch in the "Agenda du Chauffeur," published by Madame Lockert.]

THE GOBRON AERONAUTICAL MOTOR.

FOLLOWING up the descriptions we have lately published of the Gnome, Pipe, Farcot and other light petrol motors exhibited at the recent Salon in Paris, and which have been specially designed for use on aeroplanes, we are now able to illustrate the extremely novel engine introduced for a similar purpose by the Société Gobron-Brillié, of Boulogne-sur-Seine, France. The cylinders, which are of the usual Gobron construction, form pairs, and each pair is arranged at 90 degrees from its neighbour, the group being thus in the shape of an X. As is well known, the explosion takes place between two pistons in each cylinder, which, by the expanding gases, are forced away from each other. All the connecting rods of the lower pistons in one plane are connected to a single crank pin. The outer pistons of each pair of cylinders are connected by rigid rods with cross-heads E, in the two extremities of which are supported by a sort of universal joint the long connecting rods B², four of which work on the same throw of the crank shaft, which is enclosed in the central case.

Another novel feature of the engine is seen in the fact that the usual cam shaft and gearing for operating the valve gear has been dispensed with, its place, so far as the exhaust valves are concerned, being taken by an eccentric cam C centrally located on the crank shaft and actuating the valves through lever *l* and rocking beams *a*. The eccentric is provided with a double groove connected together at one point and in which runs a sort of shuttle. As the cam revolves the shuttle passes from one groove to the other and so operates the levers of one or other of the exhaust valves of the adjacent pair of cylinders at the desired moment. As for the inlet valves, these are of the automatic or suction type, the mixture being supplied from a single carburettor so located that the gas has to travel at equal distance to each of the cylinders. Two magnetos are employed for ignition purposes, each machine

Fig. 1.—General View of the Gobron Eight-Cylinder (16-piston) Aeronautical Engine.

supplying current to four cylinders, so that in case of accident to one set the motor would still operate. In fact, the engine really comprises two twin-motors, since the idea has been carried out of making the four cylinders in one plane independent of the other, so that in case of a breakdown of one set the motor could work on at a sufficient speed to allow the aeroplane to safely descend. The magnetos, which are driven by skew gearing off the end of the crankshaft, are mounted on small platforms attached to one side of the central crank case.

The cylinders are provided with copper water jackets, the circulation being maintained by a pump driven off the crankshaft through the vertical shaft *l*, seen in Fig. 1, for which, as also for the sectional views, we are indebted to "La France Automobile." The lubrication is maintained by means of a small gear-pump which draws the oil from the lower part of the cylinders and forces it back to the upper portion of the same. The cylinder

bore is 90 mm. and the stroke of the two pistons 160 mm., the engine developing 60-h.p. at a speed of 1,200 revs. per min. and 80-h.p. at 1,600 revs. The weight of the motor is given as 330 lbs., equal to, taking the maximum power developed, about 4½ lb. per h.p.

MOTORING IN ALGERIA AND TUNIS

CAPTAIN JAMES ARCHIBALD, of Washington, U.S.A., has recently returned from a two months' motor tour through Algeria and Tunis. He was much impressed with what he saw, and predicted that these two countries will become a favourite touring ground. He considers the roads the best in the world, superior even to the national roads of France. Captain Archibald went from Tunis to Le Kef, Bone, and to a point 100 miles beyond Biskra, then back to Constantine and Algiers. "It was by invitation of Comte Roger Martimprey, whose grandfather was at one time Governor of Algeria, that I made the trip," states Captain Archibald. "As an example of what the French have done, they have connected the sea coast towns of Bougie and Djidjelli by a road cut right out of the side of the cliffs. And it should be noted that the total number of inhabitants of these two towns is less than 40,000. This means that the Algerian authorities are building for the future. There are mines, farming lands, and residential properties to be developed along the coast that will make it a rival to the Riviera. There are thousands of miles of roads in Algeria and Tunis, marked every ten miles with a stone and at every cross-road with a guide-post right out into the desert. And all these roads are magnificently built, straight and smooth as a billiard table. Not only are the main cities connected by broad highways, wonderfully graded and drained, with tunnels when necessary, and covered ways through the mountains that would do credit to the best railroad systems in America, but even the remote mountains are networks of skilfully-surveyed bridle-paths, connecting the main roads for mules, donkeys, or camels."

MESSRS. PEARSON AND COX, of Shortlands, Bromley, Kent, sole agents for the Maxwell (American) car, several of which they have disposed of, are building a new and novel type of steam car with triple cylinders.

CONTINENTAL NOTES.

A New Motor-car Regulation in France.

A new regulation with regard to motors came into force in France on January 1st. It is apparently framed to secure the abolition of swinging number-plates, and specifies the size of lettering to be used on the plates and the method by which the rear plate is to be illuminated at night.

A Novel Tyre.

A decidedly novel solution of the tyre protector problem was shown at the recent Paris Salon by M. Tedesco, of 6, Rue du General Appert, Paris. It is known as the Talasso "route artificielle" or artificial road. The inventor argues that it is the road which does all the damage to the pneumatic tyre, and it is therefore to the road that we must look for protecting the same. He has therefore taken a number of paving blocks, placed them around his tyre and drawn them together by a tread. Consequently the delicate tyre no longer comes in contact with the road. The accompanying illustration shows the manner in which the interesting solution of the problem has been carried out. The "paving stones" referred to consist of rubber blocks B, whose profile resembles a horseshoe. The two ends are provided with steel hooks F, which engage with the clinches of the rim G. Within the mass of the rubber are incorporated layers of strong fabric A, which insure its rigidity. Twelve to sixteen of these blocks are arranged around the tyre and are connected together

by a chrome leather tread C, provided with steel studs E, and bolted to the centre of each block. The tyre itself is completely protected by this supple and strong protector. There are only two objections to this interesting invention, viz., its great weight and the fact that it does not prevent moisture reaching the rim.

La Coupe des Voiturettes.

The "Auto," of Paris, has already received numerous proposals of circuits for its Coupe des Voiturettes race, which is to be held in June next. One of them is close to Beauvais, in the department of the Oise, and another starts from Forges-les-Eaux (Seine Inférieure). According to the authors of these proposals both the circuits offer every possible advantage for the competition; that of Beauvais measures about 34 kilometres and is at a distance of 70 kilometres from Paris. The Forges-les-Eaux circuit, which forms a triangle with Forges as its apex, measures 35 kilometres; it is situated at about 115 kilometres from Paris and has the advantage of being fairly close to Rouen and Dieppe. Among the various other circuits suggested one starting from Amiens and passing by Querriers and Saint Gratien is rather captivating; it is composed of excellent broad roads and measures exactly 25 kilometres. In its whole course it does not pass through any agglomeration of houses, as even the village of Querriers is not traversed and there is not a single level crossing. Though the choice of the circuit will not be made immediately, six light cars—three Ravels and three Sizaire-Naudins—have already been entered for the race.

An "Elastic" Wheel Competition.

The "Auto" of Paris is organising a competition of spring and "elastic" wheels, as substitutes for pneumatic tyres. The event will be held from April 7th to the 17th next; the competing devices are to be fitted to motor vehicles, the latter being divided into five classes according to horse-power and total weight in running order. The minimum fixed is: Class A, 750 kilos.; B, 1,000 kilos.; C, 1,250 kilos.; D, 1,500 kilos.; E, 1,750 kilos. The test will consist of eight daily runs, during which time the cars will journey from Paris to Nice and back.

Public Services in France.

In the French Chamber of Deputies recently, M. Janet pointed out the advantages of an increased number of automobile services, and the suggestion was made that the Government should pay a bonus to even small enterprises of this kind. This would lead to the substitution of motor-buses for many horse-drawn mail coaches, which would greatly increase the speed and comfort of these services, and at the same time help the automobile industry.

The Improvement of the Roads.

Mr. Walin, the Chief Engineer of Roads and Bridges, of Brussels, considers that the line of the road of the future will be so laid out that the radii of the curves shall be the greatest possible. The radius of 328 ft. will be considered a minimum for important roads in the open country. In passing through towns and villages as well as in very mountainous countries, this minimum may be reduced in exceptional cases. In the future roads will have to be so laid as to avoid railway level crossings and drawbridges swinging on a vertical axis. It will have to be so laid out as to open up branch roads largely at the points where they join the main road. When the conditions are such as to deceive automobilists as to the direction they have to take, the causes of error should be masked by trees or by special constructions completed, when necessary, by very legible signs. As far as possible, the roads must be adapted for high speeds, broad, with easy grades and plenty of trees, and constructed with a view to a heavy and rapid traffic, but completed, if needs be, with branches to unimportant industrial centres, so as to satisfy the demands of local traffic.

Miscellaneous Items.

In view of the recent increase in the Kaiser's fleet of motor-cars, His Majesty has decided to reduce the number of his horses and carriages by half during the coming spring.—A motor-car exhibition is to be held in Antwerp from May 8th to the 23rd next.—The Pipe Company, of Brussels, has just supplied a 28-h.p. motor vehicle with expanding ladder for use in connection with the upkeep of the overhead conductors of the electric tramways in the Belgian capital.—The French Automobile Club has given a sum of £120 to the subscription which has been opened in France on behalf of the earthquake victims.—It is reported that the municipal authorities of Budapest are in the market for a number of motor-wagons.

Aviation et Chapellerie.

Les chapeliers d'Issy-les-Moulineaux surent profiter du mouvement créé dans leur commune par les expériences des aviateurs. Ils mirent en vente des casquettes de modèles différents baptisés; "la Farman," "Delagrange," "Malécot," &c. Les dits modèles, copiés sur le genre de coiffures portées habituellement par leurs parrains, furent marquées à l'intérieur de belles lettres dorées du nom de l'aviateur. Ces casquettes surent des fortunes diverses: la Malécot, par exemple, fut moins vendue que la Delagrange. Celle qui fit fureur, c'est la Farman. Vendue d'abord 1 fr. 45, elle fut tarifée deux jours après 2 fr. 45.

At Cecil Street, Carlisle, there is accommodation for about thirty cars at Fendley's Motor and Engineering Works. Plant is also available for carrying out repairs of all kinds, and a large stock of accessories is kept on hand.

SOME USEFUL NOTES.

It is very necessary to protect the joints of the steering gear, and for this purpose many cars are provided with leather-covered joints. This is a very desirable provision, and one which should be made by all who use their cars irrespective of weather. The joints should be thoroughly washed with a painter's brush and paraffin, and then given a good supply of motor grease, the whole being enclosed in a flexible leather casing, which can be sewn around the joints by any harness-maker or shoemaker.

When travelling over rough roads the driver should sit in such a position that the feet will not be shaken off the pedals. Otherwise, when the clutch is disengaged, as it should always be for a rough spot, and the car allowed to "coast," the feet may be jarred off the pedals, allowing the clutch to slam in, and causing great strain on the gears and transmission mechanism.

If a valve or the porcelain in a sparking plug breaks—fortunately both occurrences are now very rare—care should be taken to

HERE AND THERE.

MESSRS. BURNHAMS, metal sign makers, &c., have opened a garage and motor works at St. Paul's Works, Deptford.

DURING 1909 two new stations were opened by the London Fire Brigade, one at Holloway and the other at Tooting, the plant of the latter consisting entirely of motor appliances.

FIFTY Argyll taxicabs are now run in New York by the Universal Taximeter Cab Company. The chassis were imported from Scotland, and the bodies were built in Boston from original designs by the Universal Company.

MR. A. F. SHAKESPEAR, of Bromley, an old-established motor engineer and repairer, is shortly taking over new and large works at Whitstable-on-Sea, Kent, which are being specially equipped for motor-boat repairs and building.

A MEETING of motor-car manufacturers and importers was held at the Hotel Cecil on Tuesday to discuss the question of certain foreign patents in their relation to motor-cars. Various resolutions were adopted and the gathering terminated with a vote of thanks to the chairman. The proceedings were private.

A French Travelling Theatrical Party now makes its journeys from town to town by the special De Dion Motor-Bus depicted in the illustration. Not only does it carry the Actors and Actresses, but, as will be seen, the roof is specially arranged to convey the properties.

ascertain whether any of the pieces have got into the cylinder. If so, they should be removed before attempting to run the motor, as it does not take a piece of steel or a few chips of hard porcelain a very long time to so cut a cylinder that it must be renewed. As a rule, cylinder walls are not of sufficient thickness to permit re-boring if it is necessary to take off more than the merest suspicion of a cut, and a few chips caught by the piston can make fairly deep grooves the entire length of the stroke.

To prevent any emery or other abrasive material from falling into the cylinder while grinding in the valves it is a good plan to tie a length of strong string to a small piece of waste and force the latter into the cylinder. If any of the mixture should happen to fall off the valve, the waste catches it, and when the grinding operation is completed it may be drawn out with the waste by means of the string.

In the case of a nail puncture in an outer cover, the hole made by the nail should be covered by sticking a bit of prepared canvas to the inside of the casing to prevent grit and water from working in between the inner tube and the cover.

THE Hon. Charles S. Francis, the American Ambassador to Austria-Hungary, has lately ordered a special electrical motor landaulet, which is to be exclusively used for making calls at the palace of the Emperor Francis Joseph. With its dignified appointments and two men on the box the vehicle will no doubt attract attention in the streets of Vienna.

A NEW tyre, in the construction of which solid rubber enters, is now being tried on a 50-h.p. six-cylinder Thames car. This is known as the Blaisdell, and the rubber is claimed to be prepared in such a way as to secure the utmost resilience while being able to withstand punctures and other terrors of the road. We hope to record our own impressions of the running of a vehicle fitted with these tyres at an early date.

MESSRS. VAN RADEN AND CO., LTD., of Coventry, forward their general price list for 1909, in which are set forth particulars of their patent spun glass and woven glass accumulators, to which we recently referred in these columns. The illustrations also include hand lamps, roof lights and reading lamps for the interior lighting of the car, the Van Raden induction coils, low tension contact makers, sparking plugs and other electric devices with which the name of the firm has been long associated.

MR. D. T. ALLEN has opened a large new garage at Bromley, Kent, adjoining the south station on the London road. There are two main road entrances and accommodation for over a dozen cars.

WE illustrate herewith a new two-cycle motor which has recently been put on the market by the Wisconsin Machinery and Manufacturing Company, of Milwaukee, U.S.A. As will be seen, it is of the differential piston type; there are three valves to each cylinder, all of them of the common poppet type, operated from a cam shaft, as in an ordinary four-cycle motor. The cam

shaft, however, turns at the same speed as the crank shaft. The novel feature of the engine is that it does not pre-compress its charge in the crank case or any other chamber, the charge being drawn directly into the working cylinder. A is the working cylinder and B is the annular chamber. Supposing the piston to be at the top of its stroke and the charge contained in A to be exploded, driving the piston down; when the latter gets well toward the bottom of its stroke the port F is uncovered and a large part of the burning gas passes out through the exhaust valve D, which has been opened at the proper time by its cam. Meanwhile the downward movement of the piston has created a vacuum in the closed chamber B, which increases as the piston continues to move down. When the piston is near the bottom of its stroke it uncovers a series of ports G and the remaining burnt gases rush through these to fill the vacuum in B. After this movement is well under way the valve C is opened by its cam and mixture is drawn in around C to fill A directly from the carburettor. When the piston reaches its lower dead centre the valve C closes; so as soon as the piston has moved up far enough to close the ports G it begins to compress the mixture in A. The valve E then opens and remains so for the entire up stroke, so that the burned gases are completely exhausted from the chamber B.

It is reported that arrangements have been made between the Hart-Kraft Motor Company, of York, Pa., U.S.A., and the Post Motor Company, of New York, whereby the latter establishment will undertake to put no less than 1,100 petrol lorries, made by the former, in service within a radius of fifty miles from the American metropolis. The maintenance of these machines will be undertaken by the Post company, which will lease them on yearly contracts to establishments which have need for their services.

WHITAKER'S ALMANACK for 1909 preserves the features which have given it an authoritative position among this class of book for more than forty years. The index now extends to over 6,000 references, and the section relating to the British Empire has been considerably extended, while new articles deal with the Navigation of the Air, the new Patent Law and similar matters. The progress of the motor industry in the British Isles is also briefly set forth. As a work of reference, despite the publication of several other annual works, Whitaker's Almanack increases in favour.

A DEBTOR at the Hertford Bankruptcy Court, who had been carrying on business as a horsebreaker, attributed his insolvency to the increasing use of motor-cars, with the consequent bad trade and loss of business.

A NEW organisation known as the Women's Motoring Club of New York held a two-days' run from New York to Philadelphia and back on the 11th and 12th inst. The motto of this club is "By women; for women," and the run was for cars driven by women, and only women passengers were carried.

MESSRS. WADHAM BROS., of Waterlooville, near Portsmouth, automobile engineers, have opened their new garage and works, covering a space of some 4,000 square feet. It is situated less than fifty yards from the main London road. The establishment is lit throughout by electricity, and every facility and accommodation will be afforded automobilists touring in and about the district.

THE Junior and O.T.A.V. Cars Company, Ltd., of Long Acre, London, W.C., have taken up the agency in the following districts, South Essex, Kent, Surrey, Sussex, Hertfordshire, Bucks, and Middlesex, for the Bentall cars, manufactured by Messrs. E. H. Bentall and Co., of Heybridge, Malden, Essex. The London manager of the Junior Company, Mr. E. E. Leverett, will be pleased to explain the points of the new vehicles to any interested inquirer.

WE learn from the "British and South African Export Gazette" that Mr. Cecil Dawes, engineer to the Transvaal Taxi-Cab Company, Ltd., which, by the way, proposes shortly to increase its capital and to place at least 100 cabs on the Johannesburg streets, is expected to visit England at an early date, his object being to complete negotiations for the purchase and shipment of the first consignment of cabs. With Capetown and Durban also interested in the "taxi," and other Colonial centres likely to become so, the South African market for these vehicles is destined to prove an important one.

FROM the Daimler Motoren Gesellschaft, of Unterturkheim, Germany, we have received a copy of the 1909 catalogue of Mercedes cars. This gives full particulars of the various models—15-20-h.p., 35-h.p., 45-h.p., 55-h.p., 65-h.p., four-cylinder vehicles, and the 65-h.p. and 75-h.p. six-cylinder cars. The two smaller types have cardan shaft transmission while the others have side chain drive. The list is well illustrated, views being given of each of the chassis as well as of the engines and other parts of the mechanism. The final portion of the catalogue is devoted to full-page pictures of the different types of bodies which may be adapted to these well-known machines.

View of Rear Axle of D.S.R. Car. (See page 973 last issue.)

THE French Minister of Public Works has issued a notice to the effect that the painting of the identification number on the radiators of motor-cars does not fulfil the requirements of the law in France and that the numbers must be shown on a proper plate.

THE Allen-Liversidge front-wheel brake has been entered for a trial by the R.A.C. of its anti-skidding properties, and of its general efficacy. Provisional arrangements have been made for the test to take place in the first week of February.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

UNUSUAL MAKE-SHIFT REPAIRS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—An account of how I made the vulcanite pipe stem of a tobacco pipe answer as a temporary carburettor jet may interest some of your readers, as I think this is one of the most curious make-shift repairs. It happened this way. The car—a single-cylinder—started misfiring, and when popping in the carburettor commenced I decided it was time to have a look round. Dismounting the carburettor, I found the jet choked, and in removing this with a spanner it unluckily broke in two in the jet chamber. I had not another jet with me and as the carburettor was of an old type things looked awkward. Pulling out my pipe, I was about to light up, when the thought occurred to me that the round vulcanite pipe-stem might answer as a substitute for the jet. As luck had it it was a good fit, and I found that I could screw it into the carburettor. The jet was a shade longer than the other, but with fell air I was able to start up the engine, and I got home without further trouble.

The question was recently asked me as to why an engine that has been running comparatively quietly will become noisy. Of course, there are several reasons for this. A knock may set in through pre-ignition, insufficient lubrication, &c. Another cause is a loose holding-down bolt to the cylinder, when it follows that at each explosion there is a tendency for the cylinder to be forced up off its seating. Hence a metallic kind of clink, which is not easy to locate, but simple to remedy.

and each cylinder firing right and compression on each good. The trouble, however, was due to a simple matter, yet sufficient to upset the engine running. After starting it up, I saw a tiny puff of smoke blowing from two of the plugs, and I saw that the copper washers had been left out. When these were fitted, the engine showed its proper power.

It is well to look at the tap now and again of chemical fire extinguishers, as I had one with the tap quite seized up, and it was impossible to turn it even with the hammer. This was no doubt due to some of the liquid getting round the joint, but had it been suddenly wanted, and had I not noticed the defect, serious damage might have been done.—Yours truly,

S. I.

CARS AS BATTERING-RAMS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The daily papers have been speculating on the possibility of the car which was involved in the so-called "Cliff Mystery" having caused the damage to the wall, seeing that the car itself was not very badly knocked about. There does not appear to be anything very remarkable in the car having knocked down the wall without being itself disabled. Anyone who has had a certain amount of driving experience has probably met with far stranger and more unaccountable incidents than this.

Motoring in High Altitudes.—A car at the Lick Observatory, on the summit of Mount Hamilton, California, 4,400 feet above sea level.

The following, which came under my notice lately, shows that a very simple matter will cause a knock:—The owner of the car thought that something was wrong, as there was a continual knocking. I noticed this, and at first put it down to back-lash in the universal joints or something loose in the bevel drive, but these were found all right. The cause was very simple, as I found partly by accident, for the inspection lid on the crank case was loose. It took two minutes to tighten up the wing nuts and cure the trouble.

The following tip about metallic disc clutches may be useful:—If the car has been standing idle for a little time there is sometimes a difficulty in starting. The pressure of the springs after a long stand presses the plates together so tightly that they do not disengage easily on the depression of the clutch pedal, so that it is a job to get the gear in. A mixture of paraffin and thin oil will free the clutch, and if slipping sets in this may be overcome by adding some thick oil as required.

There is no part of a car where first-class material and design are of so vital importance as in the steering gear. I was once mixed up in an ugly smash through the steering gear suddenly going, and since then I have always been careful to see that these parts are adjusted. Of course, a certain amount of wear is bound to set in, even with the best attention.

When it is raining and the roads are heavy, in changing tyre cover or tube on the road it is difficult to avoid mud and grit getting into the cover. Of course a rag comes in useful for wiping the mud off the tyre and the rim, but I have found an ordinary scrubbing brush is a great deal better, and one with very stiff bristles does best. The same brush is often useful for a cleaning up on any part which cannot be scratched.

I was testing a new car lately, and it did not seem to pull as it ought, and after having to drop into second gear for a bit of a hill, I thought it time to have a look round. Before starting everything seemed all right,

I was once driving in Gloucestershire a small car, fitted with plain tyres, which began to slide bodily downhill, on an atrociously greasy road, with the back wheels locked. As it started this glissade at the top of the hill, which was about half a mile long and had a sharp turn at the bottom, I was not left with many alternatives. If the brakes were kept on the car would slide down, and if they were taken off it would run down faster, so I steered for the gutter at the side of the road and still applied the brakes. The end of this was that the car started to go sideways, eventually ran across the grass along the side of the road and charged a wall. About two yards of the wall were demolished and the car then receded from its onslaught and ran backwards to the bottom of the hill, where it slowed up and stopped, as the road was dry and the tyres could get a grip.

But, in spite of the wall being knocked down, the only marks on the car were at the front of one dumb-iron, where the paint was gone, and a similar scratch on the front of the corresponding mudguard; the dumb-iron was not bent nor even was the mudguard, while both headlights were unharmed. How these things were possible is still a mystery, but, after the experience, I can quite believe in a car knocking down a wall and being only slightly damaged itself.—Yours truly,

GLOUCESTER.

V388

AN ENGINE QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a twin-cylinder car with automatic inlet valves, which runs beautifully except for a loud sucking noise, which I am told is the result of engine having suction valves. The carburettor has an automatic air valve, and the main air intake is a pipe about an inch diameter, running round to exhaust pipe, where it opens out tundish fashion. Is it possible to do anything to do away with this noise without affecting the power, &c., of

the engine? The last two-cylinder car I had also had automatic valves, but this noise was not noticeable; this car had inlet and exhaust valves on one side, and the main air intake was close to the exhaust, and had a bell-shaped mouth with fine mesh netting cover. The new car has valves on opposite sides, and has a long way to fetch the air.—Yours truly,
W. T. J.

[The noise can be remedied by fitting a miniature silencer on the end of the air pipe. It consists simply of an enlarged chamber with one end perforated with sufficient small holes to more than equal the area of the air pipe, or a larger air pipe might in this instance effect a remedy. We do not think the automatic inlet valve has anything to do with the noise.]

USING THE ENGINE AS A BRAKE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice your correspondent "Mazagran's" remark in a recent issue of your Journal, that certain firms have designed their engines so as to use them as a brake, &c., when running down hill, and that by entirely closing the throttle a charge of fresh air is drawn into the cylinders at each suction stroke, thus thoroughly scavenging them. Might I remind him of the lubricating oil that has worked up with the pistons since the spark was switched off, and the effect of same when you switch on again?—Yours truly,

GOLLIWOG.

The Star 16-h.p. Double Landulet recently supplied by the Star Engineering Company to the order of Mr. Rafael Gordon, of Madrid.

ACETYLENE LAMPS IN FOGGY WEATHER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—When out driving at night during the recent foggy weather I have found that my acetylene lamps, although of great power, were of very little use in lighting up the road: indeed, I found them rather a nuisance than otherwise. I shall be glad to know if this is the experience of other motorists, and also whether there is any means of making these lamps of service in periods of fog.—Yours truly,

SUSSEX.

"E. D.'s" inquiry *re* suitable places for starting in the motor-car repairing business has brought several replies, which have been forwarded to our correspondent.

"POLICE CONTROLS."

THE measured furlong at Barnes has been in frequent operation during the past week.

MOTORISTS driving on the Epsom road should beware of the trap in the London Road, Morden.

THE controls in Long Bennington, and between the parishes of Great Ponton and Colsterworth (Lincolnshire), are generally policed at the weekend.

THE exclusive agency in this country for the well-known Leon Bollee cars has been placed in the hands of the Connaught Motor and Carriage Company, Ltd., of Long Acre, W.C. Some time ago this important agency was carried by the Victoria Carriage Works, and as the late managing director of the latter now occupies a similar position in relation to the Connaught Company, the agency is thus transferred practically to its original quarters. Recent purchasers of Leon Bollee cars through the Connaught Company include Lord Listowel and Lord Ashburton.

ROAD REPORTS.

SPEED LIMIT.—The Beckenham Council has decided to apply for an order for a ten-mile speed limit for motor-cars in certain parts of the district.

SCOTLAND.—The Cupar District Committee have applied for an order from the Secretary for Scotland to restrict the speed of motor-cars to ten miles an hour at twenty-one points within the area of their jurisdiction.

CARRICKFERGUS.—An inquiry was held at Carrickfergus on the 7th inst. on the requisition of the Carrickfergus County Council, that a speed limit of ten miles should be imposed in the town and to a distance of three miles outside. Counsel attended on behalf of the Irish A.C. to oppose the application and members of the Club residing in the district were present and gave evidence. A police sergeant who was witness for the County Council, when cross-examined stated that if warning posts such as were erected by the Club cautioning motorists to drive slowly through the town were erected at each entrance they would have the desired effect.

ARGYLLSHIRE.—The County Council of Argyllshire has agreed to improve the bend on the Rest and Be Thankful Hill, made famous by its inclusion in the route of the Scottish Reliability Trials. In consideration of this service a Scottish correspondent suggests that motorists should remember the county when registering their new vehicles.

REIGATE.—Mr. Fred T. Clayton, the Reigate Surveyor, reports that the London and Brighton main road is under repair from the level crossing at Reigate Station, through the tunnel, to the Market Place. He suggests, as an alternative route, that motorists should take the London road right at the junction with Tunnel Road, about 300 yards south of the level crossing, and then take the turning to the left at the corner, by the Red Cross Posting House.

WALTON-ON-THAMES and **Woking** are to have their ten mile speed limits as soon as the prescribed warning signs are ready for erection along the lengths of road dealt with.

THE SONG OF THE AUTO.

BY DR. J. M. HARPER.

Up with you then, as a token of mettle,
Hey, ho, my lady! ..
Into the tonneau the rest of you settle,
Hey, ho, my lady!
With care wind around you your wrappings and fall,
As springs the long bonnet away from the wall.
The horn sounds hurrah as the piston makes test,
The balm of the morning with cheer fills the breast,
The soul finds delight in the motion that's rest,
All in our outing, my lady!
Speed then, since steer we must;
Into the highway, out of the dust,
Fleet as the wind, fleetest, fast,
Into a present just out of a past.
Away through the suburbs, where lanes seek escaping,
Hey, ho, my lady!
Away where the landscapes find sunshine and shaping,
Hey, ho, my lady!
The fields green and gold kiss the hedgegrows near by,
Befringed by the woodlands that coy with the sky.
The horn flouts alarm as if 'twere a jest.
It's echoes make laughter from hill slope to crest:
Hurrah for the bliss of the motion that's rest,
All in our outing, my lady!
The rubbers are nerved with full faith in their humming,
Hey, ho, my lady!
The gearing gives answer that more speed is coming,
Hey, ho, my lady!
Dangers ahead, in defiance of harm,
Declare for retreat, as the horn sounds alarm,
The breeze in it passion the tonneau is pressed,
A waltz, 'tis for all, where speed is the zest,
With mirth unrestrained by the motion that's rest,
Hey, ho, my lady;
Be prudent, you say: What! with joy still awaking?
Hey, ho, my lady!
Ah, ha, press the lever, such joy ne'er forsaking,
Hey, ho, my lady!
Onward, and on, with the blood all a-leap,
What reck's though the wind feels a rage in its sweep;
Yea, onward, and on, till the sun's in the west,
Till motion be spent with the honk making jest,
As halting-place finds for that motion its rest,
All in our outing, my lady!

—The Canadian Motor.

THE Maudslay Motor Company informs us that Messrs. Walker and Co., of Colombo, have been appointed sole agents for the Maudslay cars in Ceylon.

CLUBS AND ASSOCIATIONS.

ROYAL.

INVITATIONS to the first annual dinner of the R.A.C. and its associated clubs, over which Prince Francis of Teck presided, on Thursday, had been accepted by H.S.H. Prince Alexander of Teck, Sir E. R. Henry, Chief Commissioner of the Metropolitan Police, and Mr. E. H. Evan-Lombe, the High Sheriff of Norfolk.

The reduction of the driving examination fee of 5s. has increased the number of candidates. On Saturday an examination of soldiers desirous of taking up motor-car driving was held at Aldershot, and other tests are being arranged for Birmingham, Exeter, Plymouth, Portsmouth, &c.

AUTOMOBILE ASSOCIATION.

As was recently announced in our columns, the Automobile Association has a stand at the New York Motor Show which opens at Madison Square Gardens on the 16th inst. Cordial relations have been established during the past season with the American A.A. and kindred societies, and American tourists who may be visiting Great Britain with their motor-cars will benefit by the rule passed on Tuesday (January 12th) at a special general meeting of the A.A., whereby members of the Irish Club and foreign motoring organisations, permanently resident in their respective countries, are now admitted to membership at the special subscription of £1 ls. per annum—the ordinary subscription to the association being £2 2s. Full particulars of this concession may be had on application to the secretary, at Princes Buildings, Coventry Street, London, W.

NOTTINGHAM.

As usual, the annual dinner of the Nottinghamshire Automobile Club, which was held at the Victoria Station Hotel, Nottingham, on Friday last week, proved a most enjoyable and interesting function. Mr. Charles Hardy, the president of the club, was in the chair, and was supported by H.S.H. Prince Francis of Teck, the chairman of the R.A.C., and Councillor J. T. Spalding, the Deputy Mayor of Nottingham. About 150 ladies and gentlemen attended the function, among those present being the Sheriff of Nottingham (Mr. E. Meller), Lord Herbert Scott, Mr. R. B. Bagnall-Wild, J.P., Mr. A. Richardson, M.P., Colonel Bosworth, and Messrs. A. Barlow, E. M. C. Instone, Julian Orde, Stenson Cook, A. McAlpin, Godfrey Lowe, C. E. W. Lucas, P. Richardson, C. R. Garrard, R. A. Young, Frederic Coleman, A. Mobbs, A. Tozer, M. Ross-Browne, and R. Cripps.

Following the loyal toasts, Councillor A. R. Atkey proposed "The City and County Authorities" in a humorous speech. Having referred to the humour of the attitude shown towards him by certain of the city fathers in the City Council, and the value of the grace of humour, he remarked that as motorists depended so largely upon the governors of the city and district, it was most essential the relations between them should be of a friendly character, and it had been part of the club's policy since its inception that—whatever else they did—they never failed, with unfailing instinct, to invite the representatives of those authorities to their annual dinner. Whatever their faults, the desires of the members of the club were the best, namely, both privately and as an organisation, to conduct their pastime in a way that should be creditable to the city. He hoped the day would be far distant when they would not feel perfectly safe, contented, and happy in extending their annual invitation to the authorities to join them on that occasion.

Councillor J. T. Spalding, responding on behalf of the borough, apologised for the absence of Major Ashworth, the Mayor, explaining that he had suddenly been called away to London on business. As far as the city authorities were concerned, they had had no occasion to complain of any breach of privilege by motorists. During the twelve years he had been on the Bench he had only had about two cases brought before him. Mr. E. Meller, the sheriff, also responded, joining with Councillor Spalding in expressing his satisfaction at the fact that motorists invariably drove through the city with very great care and discretion. Mr. R. B. Bagnall-Wild could not understand why he had been called upon to speak for the County, unless it was as "a bloated beak." He assured the club the only thing the county bench had done as a rule was to look after the safety of the people. At the same time, he felt that no one had done so much good for motorists in that direction as the club itself. While not feeling able to-day to claim that Notts had got the best roads in the kingdom, there was a promise of something better in the future. Personally, he was not of the opinion that motorists did as much damage as some attributed to them. He felt they did more damage to their tyres than to the roads, and that in a few years' time those who travelled too quickly would cease to do so because of that damage. He scarcely thought the Nottinghamshire County Council were putting quite the right material on its roads, but the matter would be looked into carefully, and in a few years they would, he hoped, have roads of which they might be proud.

In proposing the toast of "The Notts Automobile Club" H.S.H. Prince Francis of Teck regretted the absence of his friend, the Hon. Arthur Stanley, M.P., who, according to original intentions, was to have given the toast. He could not forget he was talking to friends, and loyal friends, of the club of which he was chairman. The committee of the R.A.C. would never forget with what extreme loyalty and wholeheartedness the whole of the Notts Club elected to join the parent club in London. The Notts club were in the magnificent position of having their own track upon which to run their own speed trials. It was indeed

a piece of exceedingly good luck that the Duke of Portland was in that county, and he was glad to think that the duke had given them the road and that they were enabled to perform their trials in a manner so efficient. Again, they had another great advantage in having the support of the law. He (the Prince) had said the previous night at Leeds, and he said it to them now, that the policy of the Royal Automobile Club was this: "Do not let us go against the law, but go with the law." So long as they went with the law they were acting to the advantage of the automobile world in Great Britain and Ireland. After referring with regret to the retirement of Mr. Charles Hardy, the president, the Prince continued that he was extremely pleased to be present in his capacity of chairman of the R.A.C., and he personally thanked Mr. Hardy for the very great work he had done in the county on behalf of automobilism, and it was very possible that he might do the same work for the club in the county to which he was going.

At this point an interesting departure was made from the programme, for before Mr. Hardy responded to the toast Mr. A. Barlow rose to make a presentation on behalf of the club members to their retiring president. Mr. Barlow remarked that, along with the joyous nature of the dinner, there was an undercurrent of sadness throughout the assembly, and that undercurrent was easily understood, because they had arrived at the parting of the ways, for they were going to say goodbye to their president, who, through force of circumstances, was leaving Nottingham. He could assure them that no man in the country was a more hardworking and energetic president than Mr. Hardy. He had practically attended every meeting of the committee, and that night they were to show some tangible form of their respect for him. Mr. Barlow, on behalf of the committee and members of the Notts Club, then presented Mr. Hardy with a handsome silver vase, a piece of Chinese workmanship over 100 years old.

The Novel Motor Coach recently designed and built by Messrs. John Norman, Ltd., Cardiff, to the order of an Antwerp Gentleman. To enable the car, the chassis of which is a 40-h.p. Darracq-Serpellet steamer, to be sent anywhere by rail the top boxes are removable and the backrests fold down. The inside of the body is fitted with folding polished card tables, &c., and is upholstered in leather. The inside of the roof is of bird's eye maple.

Mr. Hardy spoke feelingly in acknowledgment of the gift. He thanked the Prince, on behalf of the Notts club, for having honoured them with his presence, and for the words he had used in proposing the toast of the club. As to himself, it had always been a great pleasure to do what he could for the club, loyally supported as he had been by the committee and the members. Mr. Hardy specially referred to the way in which Mr. Booth Granger, the hon. sec., had helped to make the president's task as light as possible. It was a great consolation to know that Colonel Birkin, a man well known throughout the county, had accepted the presidency. No man was more fitted for the post, and they would give him their loyal support. Touching upon past history, the speaker remarked that not only was the Notts Club the first to become affiliated to the Automobile Club of Great Britain, but it was the first to rally round the old flag when the parting of the ways came. Although he was leaving the district, he would continue to take just as much interest in the club as before, and he hoped to remain a member as long as he had anything to do with a motor-car. Their presentation would always remind him of the happy days he had spent with the club.

The toast of "The Royal Automobile Club" was proposed by Mr. Frederic Coleman in a speech full of amusing stories; he congratulated the R.A.C. upon the affiliation of the Notts Club—a good example which was being followed by others, not quite so brave, loyal, and true, but, nevertheless, coming in to get the benefits offered, with the knowledge and full understanding that they were affiliating with a club that "did things." In responding, Mr. J. W. Orde said the road question was one which was going to occupy their attention very seriously for many years to come. The position had been reached when, with the ever-increasing demand on the roads, the latter had got to be improved in order to carry

a traffic which ran not only for pleasure, but for business, and it behoved County Councils and surveyors to study the question to make the roads suitable for motor traffic, and dustless as far as possible. Mr. O de also mentioned that the R.A.C. had before it a scheme of insurance.

Mr. Booth Granger, the hon. secretary, proposed the toast of "The Visitors." To this Mr. A. Richardson, M.P., responded, and mentioned that he had purchased a motor-car principally for business purposes. In his view the success of the motor industry in the future chiefly lay in the fact that it would be largely used in industrial and commercial concerns. He joined in the regret at Mr. Hardy's departure. P.S. Clay, Chief Constable, also replied, stating that motorists had not given him a great amount of trouble.

A further response was that by Col. Bosworth, the chairman of the Automobile Association. The Colonel remarked that he often thought that one of the greatest purposes achieved by meetings of that kind was the strengthening of that solidarity which is at present most necessary for everyone interested in the great motor movement. Anything that made for this good fellowship and comradeship could not be other than useful; on the other hand, any individual or group of individuals which did anything to create disunion or to disturb what he might call the general cohesion of motorists was doing an ill turn to the movement. There had been recently placed in his hands a copy of a letter issued by the automobile institution in the North to officially appointed repairers, and this document distinctly bound the holder of such an appointment not to exhibit on or about his premises any plaque or placard relating to an appointment by another automobile institution. This sort of "you-shan't-play-in-my-garden" action was calculated to create much irritation and to give grave cause of offence. He thought that every reasonable man would agree that were it possible to enforce such a condition, which fortunately it was not, a great hardship would be inflicted upon other societies—as, for instance, that of which he had the honour to be chairman—the Automobile Association. Even they were God's creatures and required competent repairers, and needed an outward and visible sign by which their members could recognise the premises of the man selected and appointed by their committee as a duly qualified engineer. Surely there could be no objection to such an indicating mark, and attempted prohibition could only lead to friction and disunion. He trusted that the matter would be immediately put right, because motorists had everything to lose and nothing to gain by squabbling amongst themselves instead of standing shoulder to shoulder to resist the forces of ignorance and prejudice.

The concluding toast was that of "The Secretary," submitted by the chairman, and heartily drunk by the members.

During the evening the president presented the cups, medals, and prizes to members who had been successful in last year's competition as follows:—

Photographic Competition.—1, Booth Granger; 2, A. R. Atkey.

Wilson Cup.—1 (Wilson cup and gold medal), M. Ross-Browne; 2 (silver medal), Dr. Tressider.

One Mile Handicap.—1 (gold medal), Dr. Tressider; 2 (silver medal), G. A. Bird.

Fastest Flying Kilometre for any type of car (scratch event).—1 (gold medal), F. Newton; 2 (silver medal), E. M. C. Instone.

Foster Cup.—1 (gold medal), M. Ross-Browne; 2 (silver medal), J. E. Stanning.

Special medal for the best performance of a member who has not driven a car more than twelve months.—T. Cuthbert.

Special medal given by the R.A.C. to the Notts Club for best performance of the year.—M. Ross-Browne.

A collection was made during the evening towards the Nottingham "Guardian's" Shilling Fund on behalf of the earthquake sufferers in Sicily, a sum of £8 6s. being realised.

YORKSHIRE.

THE annual dinner of the Yorkshire A.C. was held at the Hotel Metropole, Leeds, on Thursday of last week, when Mr. E. H. Hepper, chairman of the club, presided in the absence of the president, Earl Fitzwilliam. Among those present were Prince Francis of Teck, chairman of the R.A.C., Mr. Robert Armitage, M.P., Major Atcherly (Chief Constable of the West Riding), Messrs. E. Gordon Learoyd (hon. sec. Huddersfield A.C.), A. Armitage (hon. sec. Somerset A.C.), R. J. Wells (hon. sec. Barnsley), C. P. Wilson (hon. sec. Yorkshire A.C.), J. W. Orde (sec. Royal A.C.), A. E. Masser, H. R. Kirk, Warwick J. Wright, and R. Winn.

After the loyal toasts had been honoured that of "The Yorkshire A.C. and its affiliated branches" was submitted by Mr. J. W. Orde, who regarded the association as one of the most important outside of London, and pointed to the unique position it held in having the fine stretch of protected sands at Saltburn whereon to hold race meetings. He referred in detail to the figures recently published showing the number of motor-cars in the country. Throughout Great Britain and Ireland 74,000 cars were registered in 1905, whereas at the present time there were 154,391. In 1903 there were 429,000 horse-drawn vehicles in the country, but at the present time there were 402,000, which showed that the horse was slowly but surely disappearing in favour of the mechanically-propelled vehicle. Taking a grand total of all horse-drawn vehicles, the figure of 550,400 in 1903 had now decreased to 520,000. Motorists must use the highway with proper discretion. At present there was no uniform system for erecting danger signals. The first principle was that danger signals should all be in the by-roads, for it was the duty of a person emerging from such a road to watch the main road traffic, which undoubtedly should have the right of

way. Again, they should be erected in an absolutely uniform way, or, in other words, near the point of danger.

The Chairman responded, and referred to the postal vote of the club by which they had decided to join the R.A.C., and mentioned that the club supplied danger signals to district councils applying for them. With regard to the fact that no permits would in future be granted for road races, Mr. Hepper said he trusted that it did not mean that speed trials on hills were to be prevented, and that the Yorkshire Club would get a permit for the trials at Pateley Bridge, where in the last two years they had had some excellent climbs. Response was also made by Mr. Gordon Learoyd, who said in Huddersfield they had taken up the question of inconsiderate driving and had threatened those motorists who did not behave themselves on the road with legal proceedings.

Mr. A. E. Masser proposed "The Royal A.C.," and an enthusiastic welcome was accorded.

Prince Francis of Teck, who responded. His Serene Highness referred to the history of the club, and said that within two years they would have one of the most beautiful clubs in the world. The Yorkshire A.C. had joined the R.A.C. because they were Yorkshiremen and because they were sportsmen, and all Yorkshiremen stood shoulder to shoulder in every attack, in every battle. He was glad and proud to think that they had come to the Alma Mater of automobilism. The committee, of which he was chairman, considered that there was only one possible way by which the real interests of the automobile world could be served, and that was by one united body, so that when the day of battle came they might stand together united to carry forward the interests of the automobile world, and to try and withstand in every possible way the great animosities that they had had to contend with. Referring to recent events, His Highness said that automobilists had to regain their reputation, and that could only be regained by very tactful and very careful consideration. There has been some chaff about the writings in the Press. He did think that when certain motorists wrote to the Press they might write with accuracy, and not always advance engines of their own type. His Highness mentioned that of the clubs associated with the R.A.C. thirty-seven were loyal, with a membership of 6,927; there were thirty-six auto-cycle clubs, with 2,253 members; the R.A.C. members numbered 4,507, and there were a thousand individual associates, making a total of 14,687 members of the automobile world in Great Britain and Ireland who were unitedly standing together. Fifteen clubs, with a membership of 1,277, had not yet decided to affiliate. The R.A.C., he added, might claim that it had the goodwill of the automobile world.

THE CONDITION OF THE ROADS.

With regard to trade trials and hill trials, he was certain his committee would support all the trials of the trade manufacturers and the hill trials, year in and year out. What the Government took exception to were speed trials on His Majesty's highway. Somebody had suggested that motor-cars were unsuitable for the road. "I might suggest," said His Highness, "that the roads are unsuitable for the motor." In conclusion, he said: "Whatever we automobilists do, let us all stand together, not against the law, but with the law, and therefore help the law and further our own interests."

Mr. H. T. Wells, of Barnsley, proposed "The City, Town, and County Authorities," and in response, Major Atcherly, the Chief Constable, mentioned one or two points on which the authorities and motorists might co-operate. He suggested something in the nature of a reconnaissance of the country for the placing of danger signals at those places where they would be most useful to automobilists. He understood that there was a complaint that very often these signs were erected in some parts of the county unnecessarily, while in other parts they were not seen at all. When he was in Shropshire there was started an automobile club, by means of which useful work was done in the reconnaissance of the county, and the police had thereby some indication of the places that required most supervision. If the Automobile Club of Yorkshire would co-operate in that direction, it would possibly be for the good of the public. It would be for the good of all if there were a controlling body, something in the nature of the Jockey Club, which would have a greater effect than the law itself. They did not take a policeman into the hunting field. The Master of Hounds had a tremendous hold over the hunt, and this was secured by means of discipline.

Dr. Sydney Rumball proposed the health of the visitors, to which Mr. A. Armitage responded. Speeches were brought to a conclusion by Mr. J. S. R. Phillips, the editor of the "Yorkshire Post," who, in proposing the health of the chairman, suggested that the R.A.C. might form a company that would insure the general public against collisions with motor-cars.

YORKSHIRE CHAUFFEURS' ASSOCIATION.

At the inaugural meeting of the Yorkshire Chauffeurs' Association, last week, Mr. L. Smith presided over a large attendance. The Association, while not concerning itself with matters of wages, will endeavour to assist members in getting good situations and in protecting their welfare generally. Mr. Ellett, 44, Meadow Lane, Leeds, is the secretary and Mr. Norman Hurst, of the St. John's Garage, Wade Lane, Leeds, is giving free advice to members of the association.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

At the first meeting of the newly elected Executive Committee held this year Mr. Albert Brown presided, and a balance in the bank of £1,427 was reported by the hon. treasurer; 122 subscribers, thirteen members, and two life members were also elected.

On the day following the meeting of the Executive Committee a meeting for the purpose of forming a Coventry centre was held at the King's Head Hotel, Coventry, Mr. C. V. Pugh presiding. Mr. A. J. Wilson addressed the meeting, and the proposition for the formation of the Coventry centre was moved by the Chairman, seconded by Mr. R. L. Jefferson, and carried unanimously. The latter gentleman was elected hon. secretary, with the following committee:—Messrs. S. Smith (Rudge-Whitworth), J. Calcott (Calcott Bros.), A. E. Dover (Dover Ltd.), C. D. Pole (Singer Ltd.), Auerhan (Triumph Company), Gibbons (Swift), J. G. Morgan (Coventry Chain Company), H. Smith (Rover Company), John Griffiths (Middlesmore Ltd.) Jenks (Centaur Company), A. Bednell (Raglan), W. Jones (local agents), Grinyer (Alfred Herbert, Ltd.), A. Allum (Dunlop Tyre Company), and representatives to be elected by the Daimler, Humber, and Premier Companies.

AUTO CYCLE UNION.

A SIX days trial, probably with Shrewsbury as a centre, will be held by the Auto Cycle Union in July next. The matter will be finally decided by the committee at their next meeting.

The first quarterly trial of 1909 will be held on Wednesday next over the usual route from Uxbridge to Banbury and back, via Bicester, Aylesbury, Tring, Chesham and Amersham.

SCOTTISH.

THE club have made an arrangement with the Society of Automobile Mechanic Drivers of the United Kingdom, which has lately established a branch in Scotland, for the furnishing to the Club of weekly lists of members of that body out of employment, and any names on that list will be available on application to the Club secretary.

IRISH.

THE annual general meeting of the Irish A.C., will be held on Thursday, the 25th prox. Arrangements have been made for the election of the club's caution posts at several dangerous corners and cross roads in county Kildare.

MR. R. S. ROBERTSON, Meadow House, Godalming, has been appointed secretary of the West Surrey A.C.

AT the last council meeting of the Institute of British Carriage Manufacturers Mr. T. E. Worger was elected an honorary life member of the Institute, and a letter from the French carriage builders accepting the invitation to visit London this year was reported.

CASES AGAINST MOTORISTS.

FIFTEEN CONVICTIONS.

At Edgware, on the 6th inst., Thomas Sopwith, of 83, Cadogan Gardens, Chelsea, appeared to an adjourned summons for exceeding the speed limit with a motor-car, and also for failing to produce his licence for the inspection of the police on October 11th. The case had been adjourned for proof that Royalty were immune from the ordinary law, it being stated that the Sultan of Zanzibar was on the car when the alleged offence was committed. Mr. Staplee Firth argued that a firm of motor car agents, in which defendant was a partner, took the Sultan of Zanzibar for a trip to show him the merits of a particular car. Defendant acted under the directions of the Sultan, and being his agent was not subject to the jurisdiction of the courts. Sir W. S. Gilbert (the chairman) said the arguments advanced applied to a case in which a monarch was personally summoned or against whom an action had been instituted. If the Sultan or his servant had driven the car the defence would have been valid. The evidence before the court was that the defendant took the Sultan for a drive, with a view to showing him what the car could do, and for the purpose of inducing him to purchase one of a similar description. The Bench considered the case proved, and the defendant was solely responsible for the car. Sub-Divisional Inspector Hyam then proved fourteen previous convictions against defendant for offences under the Motor-Car Act. The chairman said the Bench would damp defendant's enthusiasm by a fine of £25 and costs, and six months' suspension of his licence on the first summons, and £5 and costs for failing to produce his licence. Mr. Firth asked for a stay of execution for a fortnight to enable him to appeal, which was granted.

REBUKE AND COMMENDATION.

A batch of motorists were prosecuted at the Wimbledon Petty Sessions the other day, and during the hearing of one case the Chairman (Mr. C. Tyrrell-Giles, K.C.), found it necessary to administer a severe rebuke to a constable for his interference. When P.C. Welsh was giving evidence against Mr. F. W. Cracknell, to show that defendant was driving a motor-car at a speed of fully twenty-six miles an hour along Parkside on December 13th last, he was asked why he had not stopped another car which went over the measured furlong at a speed of thirty miles an hour, according to defendant. P.C. Plimmer thereupon stepped forward and commenced to answer the question, but he was sharply pulled up by the chairman, who said, "You are not being asked. When you give evidence, give it, and don't give it until you are called upon. Remember that in future, or else I will make it worth your while."

Dr. Claude Woakes, 52, Harley Street, Cavendish Square, was summoned, at the South-Western (London) Police Court, for driving his

motor-car at an excessive rate of speed in Kingston Road, Putney. P.C. Welton timed the defendant over a measured furlong, and judged the speed at over thirty-three miles an hour. The defendant, said the constable, became excited when stopped, characterising the allegation as a — lie, and saying he would fight the matter if it cost him £50. Giving evidence on his own behalf, the defendant admitted travelling quickly, as he was anxious to get to his mother, who was ill. Mr. De Grey said in that case he would allow the summons to be withdrawn. Though the excuse was no defence for breaking the law, yet when a doctor was on his way to see a patient the circumstances justified him in saying he would not convict. The defendant desired to add that the behaviour of the constable was most tolerant and excellent. Mr. De Grey: I am very glad to hear you say that; it is not the first time the same thing has been said.

BATCHES.

A batch of motorists were prosecuted at the Wimbledon Petty Sessions on the 6th inst., fines of £2 and costs being imposed in four cases. On the same day, at the South Western (London) Police Court, three motorists were fined £10 each for driving beyond the legal speed on the Brighton road, and a lady 40s. and costs for driving without a licence. At Kingston three drivers were mulcted in penalties of £2 and costs.

Eleven motorists were fined sums ranging from £2 to £10 at Kingston on the 8th inst., the latter being inflicted on a defendant against whom six previous convictions had been recorded.

"GUILTY" OR "NOT GUILTY."

At the Quarter Sessions for East Sussex, held at Lewes last week, the appeal case, Warren v. Brooman, was heard before Sir William Grantham and other magistrates. Lord Robert Cecil, K.C., M.P., and Mr. Huntley Jenkins (instructed by Messrs. J. C. Buckwell and Co.) appeared for the appellant, and Mr. Humphrys and Mr. Rowand Harker were for the respondent. Mr. Humphrys explained that the appeal was from a conviction by the Haywards Heath Bench on December 14th on a summons

The 30-40 h.p. Hotchkiss Car with Three-quarter Landaulet by Hamshaw, of Leicester, recently supplied by the London and Parisian Motor Company, Ltd., to Katherine, Duchess of Westminster.

taken out by Superintendent Brooman against Mr. Percy Rhind Warren, of Banyale, Withdean, for driving a motor-car at a speed exceeding the limit. The appellant pleaded guilty, and on his plea no evidence was called. There were two previous convictions against him, and he was fined £30 and £1 2s. 10d. costs, his licence was suspended, and he was disqualified from holding another licence for two years. Counsel took the objection that no appeal could lie because defendant had pleaded guilty. Lord Robert Cecil replied that the mere fact that the Court below stated he pleaded guilty was not sufficient. This was a rehearing, and the Court had to see what really occurred, and to be very careful before accepting a plea of guilty. After hearing the appellant the magistrates dismissed the case with costs.

WRONGFUL APPLICATION FOR LICENCE.

John Hayes, of Clapham Road, was summoned before Mr. Curtis Bennett at Bow Street (London) Police Court for unlawfully applying to the L.C.C. for a licence to drive a motor-car, he then being a person whose licence to drive had been suspended until February 23rd, the expiration of the period for which it was granted. Mr. E. S. D. Carter, who supported the summons on behalf of the L.C.C., said that on October 19th last the defendant applied for a duplicate licence to drive. In answer to the question as to whether he was disqualified from holding a licence he mentioned an old conviction at Uckfield, and said nothing about his licence having been suspended at Lewes until the expiration of the period for which it was granted—February 23rd, 1909. He had since been fined for failing to produce his licence for endorsement. He was ordered to pay a fine of £10 and £4 4s. costs.

TWO DISMISSALS AND A FINE.

At Beaumaris recently the police summoned Mr. Macbeth, of Llanid Hall, Anglesey, for driving a motor-car to the danger of the public. He duly appeared, but it was found that he was not the person driving the vehicle on the date of the alleged offence, and the summons

was dismissed. It appeared, however, that it was his car which was in question, and also that the licence produced by the driver was Mr. Macbeth's; the fact being that he had lent his car to a friend, Mr. Buchanan, and had at the same time lent him an overcoat, in a pocket of which was the licence. Summonses were thereupon issued against Mr. Buchanan (a) for driving to the danger of the public, and (b) for not producing his licence. Two magistrates vacated their seats on the Bench to give evidence as to the alleged dangerous speed, and after retiring the magistrates fined Mr. Buchanan £2 and costs for driving to the public danger. The charge against him for failing to produce his licence was satisfied by the defendant paying the costs. For lending his licence, the case against Mr. Macbeth was dismissed, he explaining that in lending his friend his motor car and coat the licence happened to be in the pocket of the latter, and nothing being said about it there was obviously no intention to deceive.

AN APPEAL ALLOWED.

At the Surrey Quarter Sessions, before Mr. G. Cave, K.C., an appeal was heard in which Mr. William Hellyar, solicitor, sought to have a conviction by the justices of the Godstone Division, for driving a motor-car to the danger of the public, quashed. Mr. Clarke Hall was for the appellant; and Mr. Cecil Whiteley supported the conviction for the Commissioner of Police. The evidence of P.S. Kennison, who was on mounted patrol duty in the Warlingham Road on October 31st, and of Mr. and Mrs. Davis, of Fox Warren, Warlingham, was to the effect that Mr. Hellyar drove round two bends and over cross-roads at a dangerous speed in the circumstances. The police officer estimated the speed at twenty-three miles an hour, and Mr. Davis at twenty. It was stated that when called upon to stop he refused to do so, and the justices fined him £6 with costs for dangerous driving, and £4 with costs for failing to stop. It was elicited in cross-examination that the fences near the cross-roads were low, so that Mr. Hellyar could see traffic approaching the junction of the roads for a distance of forty to sixty yards, and it was contended on his behalf that the 10-h.p. car he was driving could be pulled up within twenty yards easily. He himself estimated the speed at fifteen to seventeen miles an hour. Mr. Cave said that the only point was that if the car was travelling at more than twenty miles an hour an offence had been committed. In this case the Court was of opinion that the appellant was not driving at a speed dangerous to the public, and the conviction by the justices would be quashed. An application for costs was refused. There was no appeal against the conviction for refusing to stop, but it was stated on behalf of Mr. Hellyar that he neither saw nor heard the police-sergeant signal or shout to him to stop.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

WITH a capital of £10,000 and offices at 4, Union Court, London, E.C., the Motor and Industrial Engineering Company, Ltd., has just been registered.

COVENTRY CHAIN (1907).—The second annual report places the profit for the year, after providing for depreciations, bad and doubtful debts, and all charges, at £5,265. Deducting £625 bonuses to employees and adding last year's balance there is £5,035, which is dealt with as follows: Directors' fees, £400; dividend of 5 per cent., free of income tax, £2,353; transfer to general reserve fund, £2,000; the balance of £282 being carried forward to next year's account.

BERRY'S MOTOR NON-SKID.—£10,000. To acquire from J. C. Berry, of 56, Holme Road, Bridgford, Notts, the benefit of existing inventions for improved anti-skid devices for motor road vehicles. Private. 65, Shaftesbury Avenue, W.C. (100,782.)

MERCEDES CAB COMPANY.—£100 (£1). To carry on (by arrangement with the Mercedes Daimler Motor Company, Limited, and (or) the Mercedes Company, Limited) the business of cab proprietors, &c.

PUBLIC SERVICES.

AT Liverpool a motor-cab driver has been summoned under a bye-law made in 1867 for that he, as the driver of a hackney carriage, had not lowered the flag indicating that his vehicle was for hire. The magistrate fined the defendant 1s. and warned others that higher penalties might be inflicted in future cases.

At the annual dinner of the Sheffield Taxi-cab Drivers, held at the Thatched House, Sheffield, a few evenings ago, Mr. Ratcliff, the technical manager of the Provincial Motor Cab Company, Ltd., urged the guests to drive carefully through the streets of the city. He wanted the drivers to minimise dead mileage, and referred to the offer by the company of a monthly prize being given to the man whose daily receipts per mile for the month were the highest. This did not necessarily mean that the man who earned the most money could have the highest receipts per mile, but when it did follow the company would give another guinea.

FROM the 1st prox. the taximeters of motor-cabs in London will be connected with the front wheels instead of with the back ones. This order has just been made by the Scotland Yard authorities, and has been issued to all the motor-cab companies, probably as a result of the recent criticisms which have appeared in the Press with regard to the vagaries of taximeter indications.

In addition to the new order relative to taximeters a regulation has been made requiring the affixing of a special lamp to show clearly the dial of the meter at night.

FORTHCOMING EVENTS.

JANUARY.

- 16th (S.).—Last day for receiving Short Stories for the *M.C.J.* Competition—see page 985.
- 16th-25th.—Brussels Motor Show.
- 20th (W.).—L.G.B. inquiry into application of Hertfordshire County Council for a ten m.p.h. speed limit on certain roads in St. Albans.
- 21st (Th.).—Annual General Meeting of the Southern Motor Club.
- 22nd (F.).—Annual General Meeting of the Institute of British Carriage Manufacturers at the Portman Rooms, London, W.
- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
- 23rd (S.).—Annual Dinner of the Coventry Motor Club at the Craven Arms Hotel, Coventry.
- Annual Dinner of the Lancashire A.C. at the Park Hotel, Preston.
- 26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.
- 30th (S.).—Annual Dinner of the Auto-Cycle Club.

FEBRUARY.

- 2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.S.H. Prince Francis of Teck will be among the guests of the club.
- 4th (Th.).—Annual Dinner of the Southern Motor Club.
- 19th-27th.—Manchester Motor Show at Belle Vue.
- 17th (W.).—Paper on Lubrication by Mr. J. W. G. Brooker at the R.A.C.
- 24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
- Motor-Car Show at Barcelona.
- Last day for entries for Monaco Aeroplane Competition.
- 6th (S.).—Cambridge University Motor-Cycle Club Reliability and Petrol Consumption Trial.
- 20th-27th.—Cordingley's 14th Annual Motor-Car Exhibition and Market, Agricultural Hall, London.

MAY.

- 2nd (S.).—Targa Florio, Sicily.
- 14th (F.).—British Motor Boat Club meeting at Erith.
- 24th-29th.—Irish Reliability Trials—provisional date.

JUNE.

- 10th-18th.—Prince Henry Trophy Competition.
- 14th (M.).—Commencement of the Scottish Reliability Trial.

JULY.

- 5th-10th.—Auto-Cycle Union's Six Days' Trial.

BUSINESS NEWS.

MESSRS. D. MOSELEY AND SONS, LTD., have a depot at 129, Ingram Street, Glasgow, where the tyres referred to in our last issue can be seen by Scottish readers.

CUSTOMERS of Mr. R. W. Coan who did not receive the New Year card tray are invited to communicate with him at the Aluminium Foundry, 219, Goswell Road, London, E.C.

A LITTLE pamphlet entitled "Motor Notes" has been issued by the Motor Schools, Ltd., which will doubtless be of interest to pupils of that institution.

MESSRS. H. M. HOBSON, LTD., have been appointed sole concessionaires for the Delahaye car for the United Kingdom, India, Australia, and New Zealand.

In consequence of the increase in demand for the "O.S." speedometer, Messrs. W. Searle and Co. have removed from Glasshouse Street, W.C., and have gone into more commodious premises. These are at 27, Noel Street, off Wardour Street, Oxford Street, W. At the new show-rooms the well-known instruments of the firm can be inspected at leisure.

MESSRS. STANLEY ALDER AND COMPANY, of Dundas Street, Sunderland, have been appointed district agents for the B.S.A. cars.

MESSRS. HUNTLEY WALKER AND CO., LTD., have taken the late Argyll depot in Deansgate, Manchester, for the sale of Darracq cars. Mr. R. H. Carlisle will be manager of the depot.

MESSRS. PHILIP, SON AND NEPHEW, South Castle Street, Liverpool, the well-known publishers, are just now making a great show of the "Holland" series of motor maps. These maps, with their one, two, three, and four miles to the inch, should satisfy the requirements of all motorists, the price being also exceptionally reasonable. Bartholemew's and Johnson's are the maps used.

THE head office and show rooms of the Ariel Motors (1906) Ltd., are now located at Camberwell New Road, London, S.E., to which address all communications should be sent.

THE Motor-Car Journal.

COMMENTS.

MOTORISTS do not always oppose applications for the reduction of speed limits; and, where adequate reasons are given, will generally be found to support such suggestions. Unfortunately, the proposals often made have been innocent of real necessity; hence the feeling that has been aroused in some districts against local authorities. Not often is such an amicable arrangement arrived at as was made a few days ago at Findon.

Mr. F. J. Willis, an Inspector of the Local

Government Board, held an inquiry into an application by the West Sussex County Council for a regulation restricting the speed limit of motor-cars to ten miles an hour, on a section of the main Horsham and Worthing road through Findon parish. Mr. de Montmorency, on behalf of the County Council, explained that a very satisfactory arrangement had been come to. He had had a consultation with Mr. Rees Jeffreys (representing the M.U. and the Sussex A.C.) and Mr. G. Dean (representing the Royal A.C.), and an application could be made, which would receive the support of all parties, including those who had given notice of opposition. The amended application was that the speed should be limited to ten miles an hour on the main road between a point fifty yards south of Nepcote Corner, on the Worthing side of the parish, and on the north a point between the Gun Inn and the Arundel Road—to be determined by the Inspector; also that the same speed should apply to a section of the Findon to Arundel road from the Gun Inn for a distance of 400 yards west, thus bringing the section to the motor sign erected by the County Council. Such a circumstance should suggest to local authorities the value of more “round table conferences” with motorists.

Our Short Story Competition.

So many competitors have sent in Short Stories in connection with the competition recently announced that we are still engaged on the work of adjudication. We hope to publish the name of the successful writer in our next issue.

Motor Problems of the Immediate Future.

THE “Daily Mail” Year Book for 1909 comes with its 270 pages of information on practically every subject of current discussion, ranging from the Saving of Daylight Bill to the danger of invasion by airship. Of particular interest is the article by the Rev. Arundell Whatton, who refers to the automobile progress of the past year and declares that the problem of the immediate future will be to obtain very much greater efficiency without sacrifice of steadiness, quietness, flexibility and capacity to run for extended spells without losing power and final durability. So far as the factor of efficiency goes he agrees that the recent advance has been surprising and urges that some modification, probably of the under structure of cars, is needed in order to minimise their dust-raising abilities. The road problem forms the subject of another article, in which the conclusions of the

recent International Road Congress find a conspicuous place. As a volume of statistical importance the “Daily Mail” Year Book is running some of the older publications very close.

The Scottish Motor Show.

THE annual Motor Show in the Waverley Market at Edinburgh is now open and will continue until the 30th inst. It affords ample demonstration of the continued utility and popularity of motor-car exhibitions, and should prove an augury of success for the next Show of the season, viz., that at the Agricultural Hall, London, at the end of March. Just as the Edinburgh Show provides an opportunity for those north of the Tweed to see the latest types of cars, so the forthcoming Exhibition in London gives a chance for English motorists to be kept informed of the improvements introduced from time to time. More than that, it has become a great Market, with selling opportunities as well as exhibition advantages.

Another Injustice to Motorists.

AT a meeting of the Standing Joint Committee of Cornwall the request of the Chief Constable for the provision of twenty-four stop-watches for his men was declined, and then the clerk mentioned that he had received a letter from the Home Secretary desiring magistrates to bear in mind that a conviction under the Motor Car Act rendered a person ineligible for an old age pension. Apparently this communication was seriously intended, and although wealthy owners of cars may be able to hear the declaration with equanimity, it will not be wholly pleasant reading for the working chauffeur who has been fined for some technical offence caused by the perversity of a rear light, or convicted on the word of a policeman. Not only are drivers liable to have their licences suspended and thus lose their chance of a livelihood, but the prospect of being cut off from a pension should evil days befall them is a point to be borne in mind by those who, when the attack comes, will defend the motorists' position in the Houses of Parliament.

Diary of a Day.

SATURDAY last was a fine day in town, and how much enjoyment can be crowded into a few hours when the motor-car is available is shown in the Diary of a Day which we have received from a well-known contributor. The air, he writes, was clear, although the roads were dirty. A quiet, steady progress was made through Putney and along Kingston Vale by the Robin Hood Gate. As we were proceeding up the hill leading to where the trams start, a policeman stepped out from the path and stopped the car, saying he had been signalled to stop us. Reason he had none, until a plain-clothes officer arrived on the scene and said we had been travelling at the rate of twenty-eight miles an hour. He produced his watch, and then came a second man with a second watch—identical with the first. They claimed to have timed us over a measured furlong, and while our trusty speedometer had never recorded more than eighteen miles an hour on the journey, the police watches told of 28 m.p.h. A glance back over the road confirmed our view that no accurate signalling could have taken place, while the congestion of the traffic was against the speed.

alleged. After that all went merrily save for the sense of injustice that lurked over the occupants of the car. Away to the Bush at Farnham for lunch, and then back to the Hut at Wisley for tea, where we found Mr. C. I. Thornton, returned from his travels abroad, and Mr. Gwinneer. On the way we passed a Napier cab being pushed by half-a-dozen men, its previous occupants, Miss Dorothy Levitt and her friends, apparently superintending operations. Leaving the Hut, a careful journey was made to London. After dinner we saw "What Every Woman Knows," at Hicks's Theatre, and, curiously enough, three of our motorist friends of the afternoon were near neighbours in the stalls. And then the day ended with supper at the Carlton Hotel, where among other motorists was Mr. W. H. Buxton, who retrieved the famous car of Miss Charlesworth.

Technical Instruction.

How popular is instruction in automobile matters from the technical side has been demonstrated during the past session at the Pembroke Technical Schools, Dublin. There were no fewer than 181 students in the motor engineering classes, and most of these have qualified for the certificate of the Irish A.C., while the excellence of the training has been recognised beyond the school—judging from the applications which have been received at the institution for competent motor drivers.

Extinguishing Petrol Fires.

FROM the British Fire Prevention Committee comes a report of a series of tests in the application of asbestos cloths, sand and steam as applied to burning petrol. These were carried out by the committee at the instance of the Incorporated Association of London Dyers and Cleaners, the idea being to ascertain the effect of the application of the materials mentioned, more particularly under conditions which would be met with in processes employed on the premises of dyers and cleaners. The tests demonstrated the complete efficiency of asbestos cloths in subduing fires caused by spirit vapour, and proved that where trade processes require the employment of petrol these cloths form a most valuable first aid appliance. It was amply demonstrated that they could be of great service in confining a fire to a limited area until other appliances could be brought into play. The efficiency of sand was proved where it could be employed to soak up spirit, the vapour of which is ignited, but in the opinion of the committee further tests should be carried out before anything like an authoritative conclusion is published. With regard to the employment of steam the effect of this was most marked. While there was plenty of ventilation in the upper part of the hut in which the

tests were made to correspond with what would be arranged for in buildings occupied for processes of manufactures requiring the use of volatile spirit, the steam nevertheless quickly diffused throughout the building and quenched the fire. It is, however, important in this connection that the amount of available steam should bear a suitable relation to the cubic contents of the room or rooms to be protected.

Motoring in the Isle of Wight.

MOTORING in the Isle of Wight is being freely indulged in both by residents and visitors, and it was a thoughtful provision of the former to provide a dinner and social gathering for the rural road men throughout the Island on Saturday night. This was intended as an acknowledgment by local motorists of the help rendered in improving the condition of the highways. Acting on the French proverb that gratitude is generally a lively anticipation of favours to come, the occasion was also used to enlist a sympathetic consideration for further improvements. Not only is the maintenance of a high standard of roadway in the Isle of Wight of importance to those who motor, but, having regard to the attractions of the island to owners of cars from a distance, the local authorities would do well to continue their interest in bringing the roads into as fine a condition as possible. The Deputy Governor of the Isle of Wight, Mr. T. P. Cochrane, has actively interested himself in that phase of improvements, and the results should be gratifying to all concerned.

From the Frying Pan into the Fire.

SUCH was the homely warning which Lord Montagu gave motorists in his speech at the dinner of the clubs associated with the Royal A.C. It is a position from which we have never deviated since the newspaper controversy began, always recognising that any panic legislation will make the lot of the motorist even less tolerable than at present. True, the attempt to reduce the speed of swiftly moving vehicles by Act of Parliament has brought about many anomalies; the administration of the law has become encrusted with many prejudices among people who have hitherto had a high respect for justice, and no one is satisfied. But if the agitation which has been fostered of late had its way, the difficulties would be greatly increased, and the imposition of a lower speed limit than that which is now in operation might be a matter of possibility. Hence the wisdom of the suggestion to let things remain as they are. Better suffer ills we know, than run to meet a strange fate which may be worse.

A Police Admission.

THE policeman is generally regarded as an immaculate person, whose goodness extends to an incapacity for making mistakes. This is a view which has been steadily cultivated by magistrates and others who have business in courts until it has been regarded as indicating an absence of patriotism to suggest that a constable could err. Of course motorists have been sceptical, and have, from their own experience, known differently; but that has been regarded by official folk as evidence of a kind of mental aberration, just as the possession of a motor-car is thought by some hotel proprietors to indicate a millionaire. At length, however, this faith in the fairness of those who administer the law has received a shock, and the Croydon county magistrates have had confession from the police that in working a "control" they timed the motorist as he put on a spurt to pass some carts. Thereupon the Bench dismissed the case—a rebuff to the enthusiasm of the police which would not have been given in many parts of Surrey. We have always deprecated police traps as un-English and as tending to bring the police into bad odour with a class of citizens who have always sought to exalt and not degrade the administration of the law. The matter is bad enough when the traps are of the length stated and the stop watches are of good quality and proved reliability.

But it is becoming a very low sort of game when doubt may be expressed with regard to the measured lengths and the watches employed—to say nothing of lantern flashes by night and traps downhill by day. Fortunately, however, there are now chances of escape; “timing the defendant as he put on a spurt to pass some carts” does not count in the game of Pop-in-Motorist as played at Croydon.

The Indiscretion of Councils.

SOME months ago we called attention to the way in which certain local authorities were erecting notice boards indicating a reduction of the legal speed limit in a way that was quite unauthorised. Now, similar procedure has apparently been followed in the area of the Hornsea District Council, which is in the East Riding of Yorkshire. Notices apparently showing a five mile an hour speed limit have been placed near some schools there. Unfortunately the Local Government Board has no power to order the removal of such boards although it may recognise their illegality. In the case of the Hornsea Council Mr. G. H. Strong, the hon. secretary of the Hull and District A.C., sent a protest to the Urban District Council requesting the immediate withdrawal

now some fifty miles of roads so constructed, which had in every way exceeded his expectations as to durability. The county of Kent had increased the use of granite macadam from 40,000 tons eight years ago to some 75,000 tons now, and in addition depended largely upon the treatment of the surface with tar to combat the dust nuisance and prevent disintegration. After referring to various experiments Mr. Manning said the deductions he had been able to make from his study of the problem were that before our roads were on the whole fit to take the increasing traffic they must be (1) provided with a substantial foundation, (2) constructed with a much flatter contour than is at present the usual practice, (3) in some way be rendered as waterproof and non-dust-producing as possible.

Left-hand Steering.

IN France and America a few cars are made with the steering on the left-hand side, because the rule of the road in these countries is the opposite to that in force in Great Britain. A gentleman who is selling a small American car over here, which is fitted with left-hand steering, advanced a novel point in its favour during a conversation the other day. He suggested

The new Shed in course of construction at Pont-Long, near Pau, for the accommodation of the Wright Aeroplane.

of the notices. After some discussion and correspondence the Council has ordered the obliteration of the figure “5” on the notices—an example of the work that can be done by local clubs in watching the ways and methods of the authorities when they over-reach themselves.

Modern Road Construction.

AT a meeting of the Midland Association of Local Government Officers, just held at Birmingham, Mr. G. W. Manning, the surveyor to the Staines Rural District Council, has been reading a paper on methods of modern road construction, in which he said the cost of the main roads of the country just prior to the passing of the 1896 Motor Car Act was £1,778,790 for 25,650 miles, or say £68 per mile; the cost after ten years of motor traffic was £2,478,500 for 27,380, or say £90.7 per mile, an increase of about 30 per cent. These figures were only averages, but served as a basis of comparison. After referring to the methods of road construction adopted by Telford, Macadam, and others, the speaker said that the county surveyor of Northumberland had recognised that the one starting point was foundation, and for the past six years had been providing a section of about eight miles with a substantial foundation. The result was that he had

that out in the country it was immaterial which side the steering was, as far as the driver's outlook was concerned, and that this was also very much the case in traffic driving with a small two-seated car. “But,” he said, “when you're overtaking trams, where you pass on the left-hand side, the left-hand steering is the only thing. You have trams, now, on every road out of London, and you know what it is on an ordinary car, craning round to see if the way is clear. Now on my car you are just where you want to be, and trams don't appear half so troublesome.” This is certainly an ingenious suggestion, whatever else may be thought of it.

MESSRS. E. DESCAMPS AND CO. have made considerable extensions to their motor garage in the Station Road, Kirkcaldy, in order to increase their stock of tyres and accessories for motorists on tour.

AT the British Manufacturers' Committee of the S.M.M.T. on the 14th inst., a recommendation in the interests of British manufacturers was made to the Council in connection with the gate change gear patent. This was reported on the same day to the Council, when it was resolved that, in the event of any action being threatened, the society should inquire into the validity of the claim.

ON PASSING TRAMCARS.

THE decision of the Court of Appeal with regard to the passing of tram-cars by motor-cars has again placed the motorist at variance with the law. For the Lord Chief Justice, while pronouncing the legal position, gave his opinion, in which view his learned brethren on the Bench agreed, that it would be well if the present Rule were completely upset. This the President of the Local Government Board has power to do; and we would suggest to Mr. John Burns that prompt action in the direction indicated will not only bring the official regulations into harmony with common sense, but will obviate the risks that now occur in many places where tramcars and motor-cars run along crowded streets.

Several readers have endorsed our Comments on the case in the last issue of the *M.C.J.*, and from the mass of correspondence received on the subject we select a few typical letters from representative motorists which will be of interest.

All our correspondents dwell on the way in which the Lord Chief Justice dealt with the matter. Dr. Godfrey Lowe, the hon. sec. of the Lincolnshire A.C., says that "L.G.B. regulations can be altered, and this one should be"; adding that "the case for some amendment could not be more ably put than by the Lord Chief Justice." "I have motored," writes Mr. H. J. Wells, the hon. secretary of the Barnsley and District A.C., "considerably through most of the English counties, and have invariably passed on the near side without any complaint from the police authorities. It is a blessing that most of the police regulating the traffic are gifted with common sense, and it is earnestly to be hoped that in the public safety they will receive instructions to ignore such a foolish decision as that just given." We have also had a letter from Mr. J. E. Hodgkin, M.I.E.E., the hon. secretary of the North-Eastern A.C., to this effect:—

The great object to be attained in the regulation of traffic in congested areas is an increase of speed consistent with safety, and this is the attitude taken by the Metropolitan Police, who have to deal with the largest volume of traffic in the country. If this be admitted, the argument that a motor-car should be obliged to wait behind a standing tram when there is room to pass on the left, and not to the right, would fall to the ground.

The question of safety of the passengers alighting from the tramcar is of course of great importance, but it is far easier for a motorist overtaking a tram to avoid an accident when passing it on the left hand side, where passengers crossing the road to or from the car are easily seen, than by overtaking it on the other side, where cases have frequently happened of foot passengers passing in front of a stationary tram who are hidden from the overtaking motorist until he is right on top of them.

The question is complicated by the use, in many cases, of centre standards, which are the source of the greatest possible danger, and which make it a very risky proceeding to overtake a tramcar on the right hand side, even assuming that there is apparently room to do so. The tramcars under these circumstances frequently start forward just as the motor-car is getting abreast of them, and the motorist is obliged to choose between the risk of spurting ahead on what is the wrong side of the road or again dropping behind the tramcar in order to avoid being nipped between the car and the post.

My own feeling is that it would be a great pity to lay down any hard and fast law on the subject, and I trust that when motor-car legislation comes before the House of Commons such difficulties as these will be left to the common sense of the motor driver, as it is obviously almost impossible to legislate for all conditions of road traffic and the very varying positions in which the tramway tracks are laid on the highways.

Dr. B. Holroyd, the hon. secretary of the Harrogate and District A.C., writes:—

There is no doubt that the Local Government Board ought to be approached to see if this regulation cannot be amended. To me, as an old motorist, it is ridiculous that a motor-car should have to pass a tramcar on the off side on account of the approaching traffic, especially when central standards are erected. Besides, I cannot see that a tramcar can in any way become a motor-car in the sense implied in the Act. Surely it should be classified under the heading of a light railway. I consider that if our representative governing bodies in motoring would work for the interests of individual motorists in these matters instead of quarrelling with one another it would be better for all concerned.

VIEWS OF TRAMWAY MANAGERS.

We have also endeavoured to ascertain the views of the tramway managers themselves on the subject. They are practically concerned in the matter, and, as many of them are motorists as well, they are able to consider both sides of the case. The difficulty

that has been raised is purely a legal one, as is evident from the opinion with which Mr. A. R. Dayson, M.I.E.E., the general manager of the Sunderland Corporation Tramways, has favoured us to the following effect:—"We have as yet had no actual difficulties here, and no local rules dealing with the matter. I am convinced, however, that in very many cases more consideration should be shown by motorists when passing tramcars, especially when discharging passengers. I often see instances where justifiable complaint might be made against the motor-car driver. As a keen motorist myself, you will appreciate that I am not speaking with prejudice."

Similarly at Rochdale no difficulties have arisen and therefore no local rules have become necessary. Mr. J. S. D. Moffet, A.M.I.C.E., sees "no reason why a motor-car should not be allowed to pass a moving tramcar on the near side when all is clear and so long as the other side of the road is blocked or partially blocked by either tramcar or other traffic. I consider, however, that no driver of a motor-car, or other vehicle for that matter, should attempt to pass a car on the near side which has been stopped either to set down or pick up passengers, owing to the great danger of accidents at such times. The reason we have had no complaints is due to the fact that the majority of drivers of motors and other vehicles have worked on the above lines whilst in this borough."

Confirmation of the absence of real difficulty comes from Mr. Frank Ayton, A.M.I.E.E., the manager of the Ipswich Corporation Tramways, who, like Mr. Dayson, is also a motorist. He writes:—"I think it will be very difficult to formulate any definite rule of the road for the passing of tramcars by motor-cars, simply because tramcar lines do not always occupy one definite position relative to the centre of the roadway. I think that, with careful driving on both sides, no difficulty should be experienced in avoiding accidents."

A practical opinion is that of Mr. C. W. Gordon, the manager of the Dublin United Tramways Company, Ltd., whose opinion is:—"If there be ample room on the near side of a stationary electric car, the motor-car should undoubtedly pass the standing car on that side. If there are passengers boarding or alighting from the car, and it would be dangerous for them if the motor-car passed on the near side, the motor should pass on the off side if it is perfectly free of traffic."

Most emphatic endorsement of the line that is universally taken by motorists is given by Mr. H. E. Blain, the tramways manager to the West Ham Corporation, who believes that "the recent decision with regard to the passing of trams by motor-cars will add a new terror to the existing dangers of the road and enormously increase the number of collisions occurring between motor-propelled vehicles and traffic proceeding in the opposite direction. Practically everywhere the tram lines are laid in the centre of the roadway, and it has always been understood in this district that such motor vehicles as proceed faster than tramcars should, if it is necessary to pass the latter, do so on the near side."

Mr. C. Challenger, the traffic manager of the Bristol Tramways and Carriage Company, Ltd., recently issued a rule of the road for local service, and this, although, so far as the motor-car is concerned, against the L.G.B. Regulation, has enabled traffic to be conducted smoothly and safely. It is to the following effect:—"The safe and proper way to pass by a tramway car, if overtaking it, is on the left hand side of such car."

THE Bradford Stipendiary Magistrate has just declared that the practice adopted by some motorists in trying to pass tramcars when they were picking up and putting down passengers was intolerable, and would have to be put down. This announcement has been made since the appeal decision and has been followed by the fining of several local motorists.

THE Board of Trade have issued a circular to all the companies working electric tramways or light railways on public roads in the United Kingdom, recommending them to fit a certain proportion of the cars on their system with speed indicators, to enable motormen to be trained in judging speeds. In view of certain difficulties connected with the introduction of speed indicators, the Board do not at present consider it advisable to require them to be fitted to all cars.

COSSIP FROM PARIS.

French Motor-cars Abroad.

England, even with her free trade, and Germany, Belgium, and Italy, are fast, so to say, expelling French automobiles from their respective markets. The United States, Russia, and Turkey are the only foreign countries to which France exported more motor-cars last year than in 1907. It is natural she should be most anxious to keep those good customers, and that French manufacturers should have received with joy the idea of the revision of the Franco-American Customs tariffs and the establishment of preferential tariffs, with the lowering of the duty on automobiles imported into the United States. But the turn taken by events has not been in their favour. The movement in America for the maintenance of the protective tariffs has become very strong, and the manufacturers of automobiles on the other side of the Atlantic have gone so far as to demand an increase in the import duty on motor-cars. They assert that labour in France is so much cheaper than in the United States that, after the payment of even the present duty and the carriage, French automobiles cost in New York less than similar home-made vehicles. I do not pretend to know whether the statement is correct, but it has to some extent awakened the French makers out of their apathy. At the present moment they are seeking to furnish the French authorities, which may have to discuss the question with Washington, all the necessary statistics to refute the argument. It may be doubtful that they will succeed, but in any case they will have to work hard not only in negotiations, but in their factories, if they are to continue to reap the rich harvest they have till now found in the United States.

The Troubles of French Motorists.

The men at the gates of Paris and other French towns entrusted with the collection of the town dues have always been the bugbears of motorists. Petrol being heavily taxed, the driver of an automobile leaving Paris had to stop to declare the quantity of *essence* in the tank, and when he returned he was required to produce the ticket on which that quantity had been inscribed, and to show he did not bring back more than he took out. The vexatious part of the business was, and, as a matter of fact, still is, that the motorist was constrained to make the declaration of the quantity of fuel in the tank both on leaving and returning, while the officials had always the right to verify the declaration, and to accomplish this to oblige the unfortunate driver to empty his tank, which was not an easy or short job. If by chance the motorist had made a mistake to the detriment of the Octroi a *procès verbal* was drawn up and a heavy fine inflicted. To remedy the inconveniences of such a vexatious system, motorists were last spring invited to have their petrol tanks officially measured and stamped once for all, and duly provided with a measuring stick, to make it easy to ascertain exactly how much spirit the tank contained. Each driver was also given a little book in which the Octroi men were to inscribe the quantity of *essence*. The charge of 20 francs, with what are called the "additional centimes," amounting to some two or three francs more, were, however, paid willingly by most people for that little operation, in the expectation that it would save much time and the loss of temper formerly entailed so frequently by the Octroi officials making them empty their fuel tanks.

A New Trouble.

Till recently this arrangement worked fairly well, but the town due officials have now found a new means of annoying motorists. When a car provided with a stamped tank and a measuring stick stops in front of the Octroi bureau, the official is very often dissatisfied with the declaration of the driver. To seek to prove an attempt at fraud when there is no such intention, he makes the motorist place his car in a different position, either a little further back or a few steps more ahead or even across the road. Then, condescending to verify the declaration with the measuring stick, he naturally finds a few litres more or less of spirit, as the case may be. Several of my friends have been annoyed in this way, and so many people have complained of it, that the automobile journals are loudly demanding the repeal of the regulation com-

elling the motorist to make a declaration concerning the quantity of fuel in the tank. If he makes an unintentional mistake he is, nevertheless, liable to a fine, and in some cases to imprisonment. The Octroi officials should use the measuring stick themselves.

Taxi-cab Charges in Paris.

The Paris motor taxi-cabs, with their little flags showing whether they are free or not, are for the future to be prevented from plying for hire under false colours. At least, that is the promise made by M. de Selves, the Prefect of the Seine, who has approved the proposals made in M. Dausset's report to the Municipal Council on the subject. If its application is not delayed too long, the reform is one which will be highly appreciated by foreigners visiting La Ville Lumière, as well as by the Parisians themselves. Till now, no one on hailing a taxi-cab knew exactly how much he would have to pay on arriving at his destination. The vehicle might be a 20 or 30-h.p. car charging the maximum tariff, or one of 8-h.p. plying at the same price as the horse-drawn cabs. There will, however, it is affirmed by the Municipal authorities, very soon be no longer any excuse for the "animated" discussions which so frequently take place between the drivers and their fares. Be that as it may, M. de Selves' decree will do much

Winter Sports in Switzerland.—A Hockey Match on the Ice at Leyrain. [La Suisse Sportive.]

to put an end to the chaotic state of things now existing, which is as detrimental to the taxi-cab companies and their drivers as it is annoying and vexatious to the general public. When the new regulations are applied the colour of the little metal flag will in itself indicate the price per kilometre, which, moreover, is to be inscribed on it in figures. In the case of the tariff varying according to the number of passengers, &c., that fact must be shown by the counter, which is to be placed in full view of the passengers in the vehicle, to enable them at all times to see at a glance at which tariff the counter is working.

MARNEY.

THE engineer of the Renard Road and Rail Transport Corporation, Limited, writing from Bombay on the 20th ult., reports that "Yesterday we made arrangements with the Post Office people for the road-train to meet the P. and O. mail steamer and take to the station and G.P.O. the various mails and parcels which had come for the whole of India. This work is usually done by bullock carts, and when the mail steamer is late in arriving—as it was yesterday—this delays all the up-country train departures. Owing to the road-train being used yesterday all the mail trains got off up to time. There were over 1,200 large boxes and bags of letters and parcels to be taken, and the weight was over 90 tons. They were taken by the Renard train in seven journeys, two of which were to the railway station with up country mails, and the remainder to the G.P.O. with local letters and parcels. The train was able to carry 180 large boxes as against seven for a bullock cart."

A NEW SAFETY STARTING HANDLE.

WE illustrate herewith a new safety starting handle, to prevent any accident arising owing to a back kick or back fire of the engine, which has recently been devised by Mr. A. J. Maffuniades, of 39, Duke Street, Aldgate, E.C. Referring to the accompanying drawings it will be seen that the handle proper *a* is provided at its enlarged end *b* with a clutch or free-wheel device *c*. At its centre the latter is pierced with a conical hole *d* in which fits the correspondingly-shaped end *e* of the motor shaft *f*, a firm frictional engagement being made between the surfaces by means of the spring *g* interposed between the face of the boss of the clutch and the lock nuts *i* on the outer end of the motor shaft *f*. The rear face of the clutch is provided with a boss *j* having its face suitably arranged to carry balls *k* adapted when the handle is in its normal or working position to fit in corresponding recesses *l* in the face of a collar *m*; this is secured on the shaft *f* in such a way that on the handle being rotated the clutch and shaft move with it as one piece, but on a back fire taking place the engine shaft in its rearward movement or by its sudden jerk forces the boss *j* and the collar *m* apart by reason of the balls *k* riding out of the recesses

on to the plain surface of the collar. This action takes place against that of the spring *g*, which is compressed, causing the clutch and consequently the handle to move and to break the frictional contact between the conical surfaces, leaving the shaft free to rotate backward whilst the handle is stationary. Directly the recesses in the collar on the motor shaft again come opposite the balls the handle at once moves to its original position under the action of the spring, bringing the balls into engagement with the recesses and effecting at the same time the re-engagement of the conical surfaces so that the device can be rotated as a whole. As will be seen, the employment of the free wheel, in addition to preventing a backfire injuring the operator's hands or arms, enables the improved starting handle to be directly connected to the engine shaft, so doing away with the usual saw-tooth clutch.

AT 11, New Bailey Street, Salford, Manchester, Messrs. Slater Bros. have garage accommodation for about thirty cars. Plant is available for carrying out repairs of all kinds, and a large stock of accessories is kept on hand.

MR. EDGECLUMBE ROGERS has just published the thirteenth quarterly issue of departmental decisions by the Local Government Board and other authorities. Some of these will be of interest to those motorists who are watching the conduct of the local authorities with regard to tarring roads and in other ways making the highways possible for vehicular traffic.

FIRE MOTOR PRIME MOVERS.

FIRE engineers throughout the world are at present exercised in mind concerning the best type of prime mover for motor fire pumping machines. There are four methods of propelling such vehicles, each having its supporters. They are steam, petrol, electricity, and a combination of petrol motor, dynamo and electric motor. Until a few months back England favoured steam, simply because it was the only system in use here, but a change is taking place which may resolve itself into a preference for either petrol or electricity, or a combination of both. On the Continent hardly any other prime mover is thought of besides electricity. Vienna has a fleet of thirty electric pumping engines, tenders, escapes and chemical engines. Berlin also has gone solid for electricity. It is building two fire stations for nothing but electrically-propelled machines, escapes, pumping engines, hose tenders, and chemical engines. It has ordered sixty electric fire motor vehicles of various patterns, the object being, like Vienna, to discard every horse-drawn machine. The United States built the first steam motor fire engine many years ago, but is now wavering between allegiance to steam or a transfer to petrol or electricity.

The greatest problem of all, however, is whether to work the pumps by the motor driving the vehicle or to use separate engines. If the latter system be adopted, should both sets of motors be of the same type? In Europe and America both single and dual propelling and pumping plants are used, and opinion is divided as to which is really the best. The dual systems comprise petrol or steam, two engines of the same type, one for driving the vehicle and one for the pumps, and petrol-steam—one engine for pumping, the other (steam) for propulsion; steam-electric—steam for pumping and electricity for driving. Biebrich, Germany, has an example of the double steam type; Vienna and Berlin, with other continental cities, have steam-electric pumps; Breslau has a steam-electric vehicle; and Wayne, U.S.A., has lately put into commission a double engine petrol machine. There has been ample experience with steam-electrics, but little with the others. The Wayne machine has two petrol motors which can be coupled for pumping or propulsion, although usually only one at a time is used. Venice has a fire float with pumps which are driven by a 20-h.p. steam engine, but a 20-h.p. petrol motor is also provided for operating the propellers. Both engines can be coupled for propulsion, but not for pumping. The system is reported to work well. Vienna and Berlin prefer the steam-electric system to steam-driven pumps and vehicle, whether by one or two engines.

Examples of the single engine pumping and propulsion steam fire pumps are in use in London, Liverpool, and many other home and Colonial cities. Lord Rothschild has a fire-pump with a petrol motor used for both pumping and propulsion. The single petrol motor system is somewhat at a disadvantage compared with the steam motor serving both purposes; the petrol motor has not so great a reserve of power, and for other reasons does not give a water pressure in proportion to the power expended. For this reason a petrol motor used for pumping requires to be at least 20-h.p. greater than the power of a steam pumping engine doing the same work.

FROM the Star Cycle Company, Ltd., of Wolverhampton, comes a leaflet arranged in a somewhat novel form, and giving illustrations and descriptions of the "Little Briton" car. The vehicle, which is fitted with a 10-h.p. two-cylinder engine and two-seated racing type body, has a speedy appearance, while, judging from the testimonials given, it is giving much satisfaction to users.

THE Leeds City Diary for 1909 comes from Messrs. J. D. Robinson, Ltd., of 8, New Station Street, Leeds, with full local information, the diary portion interleaved with blotting paper making the volume a useful addition to the desks of Yorkshire firms. The various municipal activities are well set forth by Messrs. Robinson, Ltd., who are to be congratulated on their publication.

AERONAUTICAL NOTES.

A NEW aeroplane of the articulated monoplane type is being built in France by M. Robert Nau for the Monaco competition.

M. VANDENBERGH, of Antwerp, has built a new type of aeroplane. It is fitted with two wings, which work like those of a bird, and one rudder.

THE Club Aeronautique Helvetica is the name of a new association which has been formed in Neuchatel to foster the aeronautical movement in Switzerland.

THE Vendome aeroplane was taken out for trial at Bagatelle, near Paris, at the end of last week. Unfortunately owing to the strong wind prevailing, the apparatus met with an accident and was seriously damaged.

It is reported that King Alfonso intends to add aeroplaning to his other sports. It is, in fact, stated that he will shortly visit Pau, where he will make some flights in company with Wilbur Wright, and that he has purchased two machines for his own use.

RULES have been compiled by the Aviation Committee of the Aero Club of France for the issuing of pilots' flight certificates. So far these certificates of competence have been issued to Messrs. Bleriot, Santos Dumont, Delagrangé, Esnault-Pelterie, Henry Farman, Captain Ferber and the brothers Wright.

SOME trials were carried out near Turin last week with a new aeroplane designed by Signor Faccioli. The apparatus covered a distance of about 110 yards at a height of twenty-three feet from the ground, when the steering rudder suddenly broke, causing the machine to fall to the ground. The aeroplane was considerably damaged, but fortunately the designer got off without serious injury.

THE Czar has signified his consent to the petition of the All-Russia Aero Club, submitted by the Minister of the Interior, requesting his Majesty to open an all-Russian subscription to provide funds for the construction of an airship fleet. The statutes of the club provide that in time of war the fleet would be taken over by the Admiralty for the purpose of national defence.

M. LEON DELAGRANGE, who has entered two aeroplanes for the Monaco competition, has ordered a firm of boatbuilders to construct for him two floats for fixing on to his machine when launched in flight over the Bay of Monaco. M. Delagrangé is resolved to try a relatively heavy motor with a view to ensuring reliability of running, and has consequently secured a 40-50-h.p.

Chenu engine weighing 400 lb. or approximately 8 lb. per h.p. He has also ordered a Wright type of aeroplane, and will presently make some trial flights with it at Pau.

Two of the principal electrical engineering concerns in Germany—the Allgemeine Electricitäts Gesellschaft and the Siemens Schuckert Gesellschaft—have already seriously taken up the construction of airships. In the case of the Allgemeine concern their departure takes the form of the promotion of a company to study the problems relating to motor airships and to carry out the trial and improvement of new inventions relating to the above subject. The new company has acquired the rights of the Parseval balloon, and the further experiments of Major von Parseval have been undertaken under the auspices of the company. The airship section of the Siemens-Schuckert Works is now making a start with the

building of its first airship. As far as is at present known this balloon will be of the non-rigid type, but it will differ in many material respects from the Parseval. The balloon will have a capacity of over 12,000 cubic metres while the motive power will be supplied by engines of 550-h.p.

In order to provide German inventors with object lessons in aeroplane flight and construction, the "Lokal Anzeiger" of Berlin has arranged a series of demonstrations on the Tempelhof parade ground, beginning on the 28th inst. Messrs. Voisin Freres, of Paris, have undertaken to send one of their machines there in charge of M. Armand Zipfel, who will carry out a series of flights for the edification of the public.

ANOTHER company, with the title The Association for Aerial Traffic in Germany, has, it is reported, been formed at Düsseldorf for the purpose of carrying

on regular traffic by means of airships. The concern is said to have been founded through the co-operation of the municipal authorities of that town and a number of leaders of Rhenish-Westphalian industry. It is understood that application has already been made to the Ministry of the Interior for a concession for an aerial line between Düsseldorf and the German capital.

MR. HOWARD T. WRIGHT's aeroplane factory in London is now working double shifts on the production not only of complete machines, but also of components. Mr. Wright specialises on propeller construction, being able to turn out complete propellers in a few days. He has completed four large aeroplanes, and has a further three on order, in addition to a large bi-plane which is to be finished in about a fortnight, when he will be testing it in the grounds either of the Aero Club or the Aeronautical Society.

In the days of the Aeroplane.—An Anticipatory Sketch from the "Daily Mirror."

Aeronautical Notes—continued.

A NEW dirigible airship has just been completed at the works of Messrs. Clouth at Cologne. The trials, however, will not take place until the spring.

FROM St. Etienne, France, it is announced that the construction of a new aeroplane of the bi-plane type has just been completed by Messrs. Tezenat and Reynaud.

THE Municipal Authorities at Dinard, Brittany, are considering a proposal to organise a competition of flying machines between that town and St. Malo during the coming season.

THE brothers Wilbur and Orville Wright are busily engaged in re-assembling their aeroplane at Pont-Long, near Pau. It is not expected to be possible to make any flights on the new trial ground before February 1st.

AT Chalons-sur-Marne, on Monday, Mr. J. T. C. Moore-Brabazon succeeded in making several flights of a distance of about a mile and a quarter, at heights varying from twenty to twenty-five feet, on his Voisin aeroplane.

MESSRS. ROLLS-ROYCE, LTD., have been entrusted with the construction of the framework of the new Army aeroplane, built to the design of the War Office, of a special weldless steel tubing, the joints being made by an oxy-acetylene welding process without the use of ordinary lugs.

General view of R.N.V. Eight-Cylinder Engine. (See page 1017.)

THE French Ligue Nationale Aérienne has organised a school of aerial navigation, to which it is attracting many of the future engineers of the country now studying at the highest technical colleges. It has eighty pupils from the Ecole Polytechnique, fifty from the Ecole Centrale, and a large number from the Ecole des Mines. Practical instruction on actual aeroplanes will be given at the Aerodrome at Juvisy.

AN experiment was made at Croydon, the other day, with a large model aeroplane which has been invented by Captain H. A. Sanders. The aeroplane, which has small wheels attached to it, ran along a platform and then soared into the air to a considerable height. The chief feature of the invention is the use of tractors, or propellers, which are fixed to the front of the aeroplane. Captain Sanders has expressed himself confident of making his invention more successful than other machines. Plans have been prepared for an aeroplane, which will be named the Comet, measuring fifty feet from tip to tip.

AFTER nearly three years' searching the U.S. Patent Office has granted a patent to Messrs. Wright for a means of flexing the rudder of a flying machine, the object of the system being to provide means by which the front as well as the rear edges of a flexible rudder will be positively actuated at different angular velocities to adjust the said rudder to the desired angle, relative to its normal position, in synchronism with the flexing of the rudder in such a way as to present the rear part of it to the action of the wind at a greater angle than the forward portion, thereby increasing the effectiveness of the rudder.

M. HENRY KAPFERER, the pilot of the dirigible balloon "Ville de Paris," has been awarded the Cross of the Legion of Honour in recognition of his services to aviation.

WE hear from Paris that a new type of aeroplane is being built by M. Bernard de Marigny. The machine will comprise a number of articulated planes, by means of which it is hoped to obtain greater stability both longitudinally and transversely.

WHAT is probably the first professorship for aeronautics has been instituted at Göttingen University, where the German Minister of Education has appointed Professor Prandtl, Professor of Philosophy at Göttingen, to lecture on the whole field of aeronautics.

FROM Magdeburg, Germany, it is announced that some trials have just taken place there of a new aeroplane designed by Herr Gradt. The apparatus, which is of the tri-plane type, succeeded in flying a distance of nearly 450 yards, but was only able to lift itself a few feet off the ground.

THE ground at Crayford, in Kent, which Messrs. Vickers, Sons and Maxim formerly occupied as a trial ground for motor-cars will shortly become the testing ground for aeroplanes and kindred experiments. It is intended to provide housing room for the flying machines, and also to establish repair shops in the vicinity of the open space.

THE inhabitants of Le Mans have arranged to present Mr. Wilbur Wright with a handsome souvenir chosen by M. Leon Bollée, president of the Sarthe Aero Club, as a memento of his stay in their district. It takes the form of a fine bronze group executed by M. Louis Carvin and representing the brothers Wright watching an eagle about to swoop on to their aeroplane, while the Muse of Aviation leans over the pioneers, inspiring them with the knowledge of flight.

MR. WILBUR WRIGHT has succeeded in flying a distance of almost eighty miles. This is more than sufficient to cover the streak of water between Holyhead and Dublin, and the idea has occurred to Messrs. Meccredy, Percy and Company, Ltd., that a successful flight between the two places would create an immense amount of interest and incidentally afford an exciting experience to thousands of Irish people who would foregather in Dublin to see the first of those who attempt the trip successfully alight in the Phoenix Park. The idea should prove attractive to aeroplanists. Messrs. Meccredy, Percy and Company, Ltd., will contribute £100 to a prize fund to the first who accomplishes this feat during the year 1909.

IN the "Times" a Royal Commission on Aeronautics is suggested to consider the whole subject in its widest sense. Some idea of the importance of the inquiry can be gleaned from the following rough summary of the heads under which the Commission might consider its work:—A. (Secret)—(1) Military applications of airships. (2) Naval applications of airships. (3) Types of machines. (4) Systems of attack and defence. (5) Airships for colonial defence. B. (Public)—(1) Present position of aeronautics. (2) Uses and applications of airships. (3) Aerial navigation. (4) Types of vessels. (5) Schemes of encouragement. (6) International aerial laws in peace and war. (7) Recommendations as to airships in war. (8) Recommendations as to competitions and races. (9) State aid for experiments. (10) Consideration of international "open routes" for all airships. (11) Applications of airships to scientific research and exploration.

MR. GRIFFITH BREWER, who is one of the most active members of the Aero Club, believes that it will be ten years before flying will emerge from the experimental stage. Of course, he has told a representative of "The Manchester Guardian," there are uses to which the flying machine can be put even at the present time. In the Sahara, for instance, where perfectly level surfaces could be found, or in the country round the Nile, it might be most useful for sending letters, provided that the aeronaut's track lay between telegraph stations, so that in case of a breakdown a message could be sent saying what time he started. Continuing, he expressed the view that it would be perfectly feasible to fly from London to Manchester on Mr. Wilbur Wright's machine, but it would be necessary to keep at a high altitude—two or three hundred feet—to avoid all towns and hills. Mr. Brewer regards the picture drawn by Mr. H. G. Wells in his book "The War in the Air" as very little exaggerated.

THE E.N.V. AERONAUTICAL ENGINE.

CONTINUING our descriptions of the petrol engines specially designed for aeronautical purposes which were exhibited at the recent Salon in Paris, we come to the E.N.V., the production of an English company known as the E.N.V. Motors, Ltd.—in which several well-known British motorists are, we understand, interested—with works at Courbevoie, near Paris. As will be seen from Fig. 2 the engine comprises

The crank shaft is carried in three long bearings and is provided with four throws, the connecting rod of one cylinder on each side of the V working on to a common crank pin. The webs of the cranks take the form of discs. The cam shaft C has all the sixteen cams cut from the solid bar, and, like the crank shaft, has a hole drilled through its centre for the passage of oil to the bearings. An interesting feature is the provision of a means of running the engine at different compression pressures, this being obtained by means of the skew gearing which drives the

I.—float chamber for oil supply.

eight cylinders, arranged in two sets of four in the form of a V. The cylinders, which are 110 mm. bore by 130 mm. stroke, are cast singly, and are turned both inside and out with the view of rendering them of equal weight and capacity to give a uniform compression pressure in each. The inlet and exhaust valves are all located on one side of the cylinders and operated off a single centrally-located camshaft. It will be noted that the valve seatings are arranged in such a way that the valve stems are slightly out of parallel with the centre of the cylinders. The

cam shaft, as by sliding the skew wheel on the shaft the action of the cams is made early or late as required.

The water jackets are of copper, electrically deposited on top of wax moulded round the cylinder. A section through one of the cylinders and its copper jacket is shown in Fig. 3; the method adopted is claimed to insure perfectly water-tight joints under all conditions of heat and expansion. The water circulation is maintained by a turbine pump E, mounted on the same shaft as the magneto at the front end of the engine.

Special attention has been devoted to the question of lubrication, which is maintained by a small plunger pump G, located in a special compartment at the centre of the crank case, and so arranged that it can be withdrawn by simply removing two nuts of the cap which covers it. It is actuated by a pivoted crosshead H, operated by a special cam on the cam shaft. The oil is forced through the passages in the crank shaft to the main and big end bearings and thence up the connecting rods into the gudgeon pin, whence it flows through the piston on to the cylinder walls. By a special arrangement the latter only receive a charge of oil at the end of the downward stroke of the piston. A float chamber I in the crank case regulates the quantity of oil drawn up by the pump, so that all danger of over-lubrication and consequent obnoxious smoke is obviated.

The engine is stated to develop 55-h.p. at a speed of 1,000 revs. per min. and weighs complete 308 lbs.

Fig. 3.—Section of Cylinders of E.N.V. Engine.
A.—Cylinder. B.—Copper water jacket.

Fig. 4.—Elevation and Plan of E.N.V. Valve and Tappet Guide.

design of the valve tappet is illustrated in Fig. 4; it will be seen that at the lower end the tappet is forked to receive a roller which bears on the cam.

At the Rhyl County Court, before the registrar, Messrs. J. E. Price and Co., St. Asaph, claimed from Miss Violet Charlesworth £28 for petrol supplied. Miss Violet Charlesworth's name was at the request of the registrar called three times loudly. The registrar said that after notice of defence had been given he had received a second letter, which in effect withdrew the notice of defence, because it asked for an adjournment *sine die*, and stated letters of administration had better be waited for. Mr. Joseph Lloyd, for the plaintiffs, asked for judgment forthwith, and it was granted.

B

THE SOCIAL WHIRL.

THE King, who has been staying with Lord and Lady Alington at Criche, Dorset, paid a visit to Wimborne Minster on Saturday morning. In the afternoon His Majesty motored to St. Giles and spent some time with the Earl and Countess of Shaftesbury.

At the meeting of last week's committee of the Royal A.C. it was reported that His Majesty the King of Spain and H.R.H. the Crown Prince Ferdinand of Roumania had signified their desire to become honorary members of the club.

My confrère of "Golfing" is now admitting automobile jottings to his delightful columns. These are being contributed by Mr. Edgar N. Duffield, whose writings in "Punch" are widely read. Mr. Oswald H. Cunningham is enlivening the notes with excellent sketches, one of which is reproduced herewith by the favour of my contemporary, who adds, "His Majesty, a sportsman of sportsmen, is a keen golfer, although his available leisure does not permit his play-

as often as he might desire. His Majesty uses his car on every possible occasion, however, so that there are three reasons for his selection as the subject of our first drawing."

THE inaugural dinner of the associates of the Royal A.C. was the social event of the motoring season. Nearly four hundred guests—to be precise 381—were assembled to meet H.S.H. Prince Francis of Teck and his brother, while the sprinkling of ladies relieved the black coat dullness of the scene, as viewed from the overflow tables on the stage. The innovation introduced by Mr. J. W. Orde—whose urbanity is a delightful and never-failing quality—of arranging the guests at small tables each for fifteen diners, promoted sociability and was hailed as a precedent worthy to be followed. Four tables were set apart for the North Middlesex Club, which had fifty-six members present, and others were allotted to the Bedfordshire, Kent, Essex County, Liverpool, Kensington and Hampshire Clubs.

MANY of the musical items in the programme were encored—a fate which did not befall the speeches, good though they were. Mr. G. C. Ashton Jonson waxed eloquent over the deeds of the Navy and Army: Sir Charles Campbell confessed to his ability

to get into "hot water," and raised a laugh at some unidentified mayor of Bath; Sir Henry Rawlinson was careful not to go beyond military bounds; Lord Montagu was in the unaccustomed position of proposing, instead of responding for, automobilism, and then came the speech of the evening from the chairman. Prince Francis is a capital speaker at postprandial functions, and his rendering of the old song about the arrow as though it were aéro was delightfully topical. Mr. A. Armitage, J.P., scored against the "Times"; the Earl of Kimberley was brief, and after Sir Edward Henry had made a better impression than do many of his men, an important announcement was made with regard to Brooklands.

THIS is now in the capable charge of Major Lindsay Lloyd, who is determined to assist Mr. Locke-King to retrieve some of the expenditure he has incurred in a venture the public appreciation of which has yet to be won. If 1,000 members of the R.A.C. or its associates join the Brooklands A.R.C. they will be admitted for an annual subscription of two guineas—an offer that should prove tempting to all who have any idea of the sportive side of automobilism.

MR. GEORGE ALEXANDER tells a story in the "Era Annual," illustrating the humour of the London cabdriver. "Being in a hurry to get home from the theatre a few days ago, I walked to the corner of King Street. An old cabman with his hansom was the first on the rank, but I shook my head at him, and called a taxi. As I approached it the hansom cabby said: 'So, Mr. G. A., you've no use for 'osses now; but you'll 'ave to 'ave one to take you on the day you're buried.' 'I went home in that hansom after all.'"

LORD MONTAGU OF BEAULIEU has accepted the office of President of the London Hampshire Society for the present year, and will preside at the annual meeting, to be held at Kennan's Hotel, Cheapside, London, E.C., on Wednesday next.

THE date of the Rodakowski dinner, at which the Earl of Lonsdale has kindly consented to be chairman, has now been definitely fixed for Wednesday, February 24th.

MR. WILLIAM VINCENT, whose high grade productions in motor bodies are well known in Society circles, has just started a service of motor-cabs in Reading. Half-a-dozen four-cylinder Unic cabs are now plying for hire in the town under his aegis and attracting the attention of visitors by the appearance of their smart landaulet bodies. A cab rank has been established outside the railway station.

MR. PERCY NORTHEY is well known to motorists, he having won distinction in the first Tourist Trophy race. The other day he set forth from London for Italy on a 12-h.p. Sizaire-Naudin. From the Nettuno Hotel, Pisa, on New Year's Day, he wrote to Mr. C. Jarrott to the effect that he reached that point without having had to consider the car in any way. "This may not sound much," continues Mr. Northey, "but when I tell you that although I have in the past driven over the Sierra Guaderamos twice, surmounted the Pyrenees 'en automobile,' and (by mistake) descended in a car from La Turbie by the packet of hairpins short cut to Monaco, I nevertheless did not meet with a tithe of the breakneck, apparently impossible conditions of precipices and hopeless road surface such as I had to negotiate along the west coast of Italy. The only "spare" I want is time. I am now off to Rome and Naples—earthquakes permitting."

At the annual dinner of the Sussex Motor Boat Club, on Saturday, an important announcement was made to the effect that as the result of negotiations with the Admiralty, a letter had been received, granting permission to the members of the Sussex Motor Yacht Club to fly the Blue Ensign on board their motor-boats and yachts.

ON Sunday last the "missing motorist" was the subject of the sermon preached at the church of St. Mary-at-Hill, Monument, London, E.C. Many motorists were missing on the occasion in question, including

LOLLIUS.

WHO'S WHO?

THE annual publication of "Who's Who" is always the occasion for reviving memories of men and their pastimes. A few years ago its pages were conned to ascertain the men and women of distinction who regarded motoring as among their pastimes. Then the novelty wore off and the car became a necessity rather than a sporting delight. We are all motorists now—even the errand boy who mounts the motor-bus and pays his penny fare as proudly as though he were buying petrol. One result is that scattered about the 2,000 pages of this indispensable work of reference are fewer references proportionately to those who indulge in motoring as a pastime. Thus, the Duke of Sutherland, the president of the R.A.C., is not, according to "Who's Who," one who counts motoring among his pleasures; and yet we had a letter from his Grace a few weeks ago in which we were informed that he employed the motor-car to facilitate his visits to his estates in Scotland—a considerable task, seeing that he owns about 1,358,600 acres. Then, too, everyone knows that both the Premier and the ex-Premier are motorists; they appear as golfers only. Similarly, the Countess of Warwick is not only a devoted horsewoman, but she recognises the motor-car as a pleasurable means to political ends. These few instances illustrate the point that motoring has become a commonplace useful convenience—but an economiser of time.

At the same time there are many people of note who still class motoring among their pastimes. Thus Sir Hugh Bell, the president of the Cleveland Automobile Club, is not only a great ironmaster and an acceptable novelist, but he motors also. Sir Stanley Bois, of Colombo, who was motoring in England during the summer, has twin joys in music and motoring, and Mr. A. T. St. George Caulfield, J.P., of Roscommon, delights in "motoring and stargazing"—two forms of pleasure that should not, however, be satisfied simultaneously. We are not surprised to find that Mr. Rees Jeffreys has "motoring, golfing, cycling" as a trio of recreations, to which billiards might be added. Mr. Joynson-Hicks, M.P., also adds motoring as well as the Presidency of the Motor Union to his hobbies, while Mr. C. D. Rose, M.P., is well known as a breeder and owner of racehorses as well as a motorist. Mr. Charles Cordingley, whose pioneer work for automobilism in this country is recognised by "Who's Who," has pastimes associated with travel, as have half-a-dozen others who are prominent in the motor world. Sir David Salomons, Bart., like Mr. Rose in England and the Baron de Zuylen in France, combines interest in horses and mechanical matters, the pastimes enumerated including driving a four-in-hand and examination of automobile designs. Many sportsmen have their hobbies on land and water; Mr. Dugald Clerk, when not investigating the problems of the gas engine, divides his time between yachting and motoring, as does also Mr. Godfrey Baring, M.P. Tennis and motoring are ranked as the recreations of Mr. Percy Barlow, M.P., and Mr. J. B. Henderson, M.I.E.E. Others whose pastimes include the motor-car are Canon A. T. Barnett, the English chaplain at Borghidera, Italy, Mr. W. T. Madge, the well-known journalist, and Mr. A. F. Calvert, the traveller. Probably the car might have been included among the pastimes of General Booth, but for the fact that he uses the automobile for a really serious purpose.

Of course there are still many men who have not yet taken up motoring—either as a pastime or a business. The Rt. Hon. Augustine Birrell has not disturbed the calm of his *Obiter Dicta* by references to the motor-car, and still delights in "pedestrianism." The Rev. H. J. Astley, M.A., Vicar of East and West Rudham, Norfolk, whose name has been frequently in the "Times" of late, however, is able to continue his archaeological studies while motoring a little. Major Baden-Powell does not claim to be a motorist; he indulges in cycling, but aspires to higher flights, for he is described as a balloonist. After glancing through the volume of "Who's Who," with its 23,000 biographies, we have found one venturesome parson, the Rev. W. Benham, rector of St. Edmunds, Lombard Street, London, who for his recreation finds his greatest delight in "riding on the top of omnibuses."

HERE AND THERE.

THE Grand Hotel Garage at Worthing is now under the control of Mr. F. G. Searle.

MR. J. S. MATTHEW, the Scottish manager of the Dunlop Tyre Company, has been appointed managing director of Argylls, Ltd.

A DRIVER of a motor tri-car, who while drunk caused bodily harm to a cab driver, has been fined £5 with £10 costs at the Newington Sessions.

THE Godalming Borough magistrates have warned two motorists appearing before them that it is very important that number plates should be kept clean.

MESSRS. THOS. B. JEFFERY & CO., of Kenosha, U.S.A., claim to have built 13,800 Rambler cars during the past seven years, as follows: 400 in 1902, 1,500 in 1903, 2,100 in 1904, 2,300 in 1905, 2,500 in 1906 and 5,000 in 1907 and 1908.

THE Bute Dock Motor Company, of which Mr. J. Blower is the manager, have opened an up-to-date garage and repairing shop at 5, West Bute Street, opposite the Dowlais Hotel, at Cardiff. Stocks of tyres, petrols, oils, accessories, &c., are kept.

THE Aachener Stahlwarenfabrik, whose Fafnir petrol engines are already well known in this country, have recently made a new departure which will be of interest to motor engineers and traders generally. We refer to the complete set of components they have lately put on the market for the building of a 16-h.p. live axle chassis of up-to-date design. The set includes a pressed steel frame, four-cylinder engine (including clutch, carburettor, water and oil pumps, magneto, &c.), front and rear axles with hubs, change-speed gear, cardan shaft, steering gear, radiator, clutch

and brake pedals, change-speed and brake levers and their connections, and the channel steel torque rod with spring at the fore end. We give a view of the latter in the accompanying illustration. The components are delivered in sections, each unit being completely built up; as all the parts are made to template and are supplied with the necessary bolts and nuts, the makers claim that the only tool required to turn out the complete chassis is a machinist's spanner or wrench. Full particulars of this novel set of Fafnir chassis parts can be obtained from the British agents, Messrs. Strauss and Co., 211, Upper Thames Street, London, E.C.

WE hear that the fourteen damaged racing and touring cars, accessories, and other salvage goods consequent upon the recent fire at Mr. Huntley Walker's garage at Hayes, Kent, will be put up shortly for auction. There should be brisk bidding, as some of the racing engines, gears, chassis, &c., are not beyond repair. A quantity of accessories, tools, &c., damaged by fire and water, will be included in the sale.

ANNOUNCEMENT is being made by the Apperson Brothers Automobile Company, of Kokomo, Indiana, U.S.A., that they own the two American controlling patents on dual ignition systems, and will enforce their rights and prosecute all infringers. About two years ago Mr. Apperson bought the U.S. patent No. 617,806, which was granted to F. E. Canda, of New York, January 17th, 1899, for "electric igniters for explosion engines," and he has himself been granted patent No. 905,625 on December 1st, 1908, for "improvements in explosion engines." It is claimed that these two patents cover broadly the use of dual systems of engine ignition involving the use of two sparking plugs or points per cylinder, with a magneto and battery with spark coil separately connected to each, with means for separately or jointly switching both sets into action.

Here and There—continued.

MESSRS. LESLIE PORTER, LTD., have at their garage in Howard Street, Belfast, accommodation for about forty motor-cars.

THE Commissioner of Police for the Metropolis has suggested to the Westminster City Council the provision of additional street refuges in Pall Mall.

As illustrating the great popularity of covered motor-cars, we may mention that no less than a dozen were drawn up at one time outside the offices of the *M.C.J.* on Tuesday afternoon last.

ACCORDING to a note just issued to its members by the French Syndicale de l'Automobile, a company has recently been formed, with a capital of £120,000, to start an industrial motor vehicle service in South America, and is now in the market for twenty motor lorries of from three to five tons capacity.

THE old-established firm of wagon builders, wheelwrights, body makers and motor repairers, Messrs. W. Till and Sons, Ltd., of New Cross, S.E., have just opened a large garage and repair depot for commercial vehicles, &c. The garage is of fire-proof construction with up-to-date lighting and heating arrangements, and is open day and night, whilst the services of a breakdown lorry and staff are obtainable at any time.

Miss Edith Paterson on the 16-h.p. Imperia.

Miss Paterson drove the car 53 miles in the hour on the Brooklands Track on the 15th inst. Mr. C. E. Whitaker is seen standing by the bonnet of the car.

OWING to his increasing theatrical engagements, Mr. Scott Russell has been obliged to dispose of his motor repair depot and garage at 242-4, High Street, Lewisham. The business has been purchased by Mr. R. Wernick, who has had many years' experience of automobile and motor launch construction in England and Germany, and is also a Daimler and Mercedes expert. Mr. Wernick is laying down further plant and is adding several well-equipped cars for hiring purposes.

FROM Messrs. Humber, Ltd., comes a copy of the 1909 catalogue of Humber cars. This is a very complete production, and gives full particulars and illustrations of the different models that are being turned out for the coming season. Details are also given of the Humber motor-cabs and travellers' cars, as well as of the combination pleasure and business vehicle. The latter is provided with two different bodies, either of which can be fitted on to the chassis in a short space of time.

A SMALLER companion volume to "Who's Who" is a New Year Book similarly published by A. and C. Black, and made up of tables of official information, race meetings, literary pseudonyms, and other knowledge that the busy man should always have near at hand. "Who's Who" is decidedly one of the most useful books of the day, its pages affording interesting reading for odd moments and being absolutely essential to those whose business it is to know a good deal about people.

THE Daimler Motor Company has intimated to the R.A.C. its desire to submit its 1909 type engine to an official trial, under the auspices and direct supervision of the club.

THE County Garage, opposite the railway station at Preston, is now in the ownership of the Lancashire Motor and Engineering Company. It is open day and night for the convenience of motorists.

MR. FAVEILL, of Sydney, N.S.W., recently visited Liverpool, and after testing the Forrest car, has purchased several of these from Messrs. J. A. Wade and Co. Mr. Faveill, who took the first car out with him on Saturday last, has acquired the sole selling agency for Forrest cars in New South Wales.

AT a meeting of the Stranraer and Wigtown U.F. Presbytery, the moderator, Mr. A. W. Black, in submitting the report on "Life and Work," said that they had still to complain of the pleasure-seeking motorist who "disturbs the quiet of the Sabbath Day. During the autumn a motor race was conducted through the district on the Sabbath, and the Presbytery most emphatically protested against having the quiet of their Sabbath disturbed by such senseless conduct."

AT the Pimlico Wheel and Motor Works, in Fulham Palace Road, Hammersmith, there is no indication of the rumoured slackness in the motor trade. Messrs. Smith, Parfrey and Co., Ltd., are very busy in all departments, repairing and renewing wheels, axles, springs, frames, gear shafts, &c. Their speciality, the lightening of too robust springs and the strengthening of those that are too "whippy," is not unnaturally occupying most of their attention, but Mr. Partridge, on the occasion of a recent visit, announced the company as being comfortably busy all round.

"WHERE to live round London" is the second edition of an excellent work published by the Homeland Association, Ltd. It deals with the northern side, and has a chapter on the geology and sub-soils. An alphabetical arrangement is adopted to facilitate reference, and interesting pages of letterpress are given with regard to places on the eight lines of railway serving London north of the Thames. As a work of reference the book deserves commendation. A chapter giving some particulars of the roads, hills, &c., would have been a feature of considerable interest to motorists, who must be ranged among those able to look for dwellings in the more distant suburbs of London.

AN entirely new type of front driven petrol lorry, with the engine, radiators, gear-box, clutch, differential, &c., in one unit, has been built by the Coborn Motor Works, Bromley, Kent, who have been granted the British and foreign patents for the machine. For 'buses and commercial vehicles the chief advantage claimed is that in the case of a breakdown the engine and the entire driving mechanism can be readily removed and another set fitted. It also renders overhaul or inspection simpler and quicker, whilst the saving in the cost of production over the ordinary type is said to be over 25 per cent. Another advantage claimed is that skidding is overcome. The vehicle has undergone severe tests with loads of 2 tons and upward over hilly southern roads, and also made the return run from Bromley to Coventry and back in a satisfactory manner.

MESSRS. BLERIOT, LTD., whose acetylene headlights are well known in the automobile world, are introducing quite a new departure in car lighting, which we had an opportunity of inspecting a few days ago. The arrangement consists of a small dynamo known as the "Phi"; this is mounted on the offside step of the car, and is driven off the clutch shaft by means of a belt; the machine, which has a capacity of 25 amps. at 12 volts, equal to 300 watts, is of a special self-regulating type, the voltage remaining constant no matter the speed at which the engine is running. Not only does it supply the necessary current for lighting a couple of head lights, two side lamps, the tail lamp and a lamp in the interior of the car, but it also maintains in a fully-charged condition a small battery of accumulators located under the driver's seat. When the engine is running the current for the lamps is furnished by the dynamo direct; when, however, the car is standing with the motor at rest, the lamps are switched on to the battery circuit. Altogether the Phi dynamo is able to supply electrical current equal to a total of 100 c.p. We hope to refer at greater length to the arrangement in a subsequent issue.

CONTINENTAL NOTES.

The Brussels Motor-car Show.

The eighth annual motor-car exhibition in the Palais du Cinquantenaire, Brussels, opened on Saturday last and will continue until Monday next. Belgian motor-car builders are, of course, well to the fore, the vehicles on view comprising the Metallurgique, Auto-Mixte, Bovy-Dheyne, Imperia, Dasse, Germain, Royal Star, Linon, Minerva, Nagant, Pipe, F.N., De Coninck, Saventhem, Vivinus, Springuel, F.I.F. and Salve. The last-named vehicle, which is shown by La Société des Voitures Salve, of Herstal, is a little two-seater with a novel system of transmission; the drive is through one or other of two pinions on countershaft, the power on the first speed and reverse being conveyed through the near side chain, and on the top speed through the chain on the right, only one road wheel at a time being driven. The French industry is also well represented by Clement-Bayard, Berliet, De Dietrich, Brasier, Panhard, De Dion, Delahaye, Delaunay-Belleville, Peugeot, Charron, Sizaire-Naudin, La Buire, Darracq-Serpollet, Chenard-Walcker, Gregorie, Mors, Renault, Rochet-Schneider, and Brillie. From Italy come the Fiat and Itala, while Germany sends the Mercedes, N.A.G., and Benz. Considerable interest is being taken in the aero section of the show. In addition to a large number of models, the exhibits comprise Baron de Caters' triplane with Vivinus engine, Baron Pierre de Crawhez's monoplane, an orthoptere by M. Adhemar de la Hault, and a helicopter by Messrs. Tips and Vlemincx.

Touring in France.

The Director of the French Customs Office has just issued a circular of which those motorists contemplating a tour in France will do well to make a note. The circular explains that the Customs officials have been directed to reduce the quantity of tobacco, cigars, and cigarettes which travellers are allowed to import for personal consumption to half what is now allowed. Accordingly, after May 1st, travellers will be forbidden to bring into France more than ten cigars, twenty cigarettes, or $1\frac{1}{2}$ oz. of tobacco. It is expressly stated that the traveller must choose between tobacco, cigarettes, or cigars, and will not be allowed to bring in the stipulated quantities of each, and that no traveller may fill his pockets with the share of a companion who may be a non-smoker. The Director of Customs also refuses to recognise the right of women to smoke, and so forbids them the privilege of importing even the smallest quantity of cigarettes free of duty.

A Hill-Climbing Competition in Algeria.

The Automobile Club of Algeria is organising a hill-climbing competition for February 14th; the event will be held on the hill known as the Camp des Chenes at Medea, the length of the course being twelve kilometres. The competing vehicles will be divided into nine categories, ranging from single-cylinder cars having engines of 100 mm. bore to six-cylinder vehicles.

The French Military Authorities and Motor Vehicles.

The valuable services motor-cars are capable of rendering the army in time of war are now recognised in all civilized countries. For several years past the automobiles in France have been subject to requisition, and now the military authorities have made public the conditions which the heavy self-propelled vehicles used in commerce and industry should fulfil to be of special use to the army. General Picquart has taken up this matter most seriously and has presented to the Chamber a proposal to encourage the manufacture of such cars by granting a premium to the purchasers of the vehicles. The Minister of War has also given his entire approbation to the action of the Société Militaire d'Automobilisme, the object of which is not only to impart to the officers belonging to it the technical instruction and practical knowledge necessary to obtain the driver's licence, but to render them capable of directing the movements of a caravan of horseless vehicles of all descriptions. The theoretical instruction is, with the authorisation of the Military Governor of Paris, to be given

at the Military Club, the first lecture being fixed for the 28th inst.

A Novel Motor-mail and Passenger Vehicle.

The illustration given below depicts one of the novel combination passenger and mail-carrying vehicles recently built by Messrs. Laurin and Klement, of Jungbunzlau, Bohemia, for the postal authorities in Montenegro. Owing to the peculiar nature of the roads in that country the vehicles have had to be built to a special design, the wheelbase having been reduced as much as possible. As will be seen, the engine—a 28-32-h.p. four-cylinder—is arranged under the driver's seat, while the differential shaft, which drives the rear road wheels, is located at the rear of the back axle instead of at the front as is usual.

Motor Car v. Airship.

Now that the airship seems to be within measurable distance of being given a place in military operations, the attention of experts is being centred on the subject of how best to meet the

attacks of the latest implements of war. To this end the Rheinische Metallwarenfabrik, of Dusseldorf, have lately completed a semi-armoured motor-car, in the rear portion of which is mounted a 5 cm. quick-firing gun, which is so mounted that it can fire its projectile in almost a vertical direction. The vehicle, which is fitted with a 60-h.p. engine and can attain a speed of over forty miles an hour, enabling it to follow any airship, has a special body, the sides of which are formed of 3 mm. thick nickel steel armour-plate. The Ehrhardt Works, of Dusseldorf, have also built a somewhat similar vehicle, this being, however, completely armoured, the driver, the gun, and the operators of the latter being enclosed in what may be termed an automobile turret.

Miscellaneous Items.

It is reported that Messrs. De Dion-Bouton have secured an order for 100 motor-buses for service in New York.—An automobile club has lately been formed at Pilsen, Austria.—A company has just been formed in Königsberg, Germany, to introduce a service of motor-cabs in the town.

Les Canots Automobiles à Messine.

Dans l'affolement bien compréhensible causé par le cataclysme qui détruisait Messine et Reggio, les canots automobiles furent de précieux auxiliaires pour les sauveteurs. Pouvant évoluer aisément, ils recueillirent de nombreux survivants et les transportèrent sur les grands bateaux, venus dès les premières heures sur le lieu du désastre. Combien de vies humaines n'ont-elles pas été conservées ainsi grâce à l'automobile.

MOTORING ACCESSORIES.

The "Little Nipper" Drinking Cup.

Messrs. Tom Norton, Ltd., of Llandrindrod Wells, have recently introduced a little novelty which will appeal to motoring tourists. We

Fig. 1.

refer to the Little Nipper drinking cups illustrated in Fig. 1. As will be seen, the set consists of half-a-dozen electroplated cups so graduated in size that they can be packed one inside the other and enclosed in a leather case. As the latter only measures 1½ in. by 1½ in., it can be carried in the motor coat-pocket

or in any suitable receptacle on the car. Other specialities of Messrs. Norton include the "Norton" motor stove and oil drip pan, each of which form useful additions to the equipment of private garages.

"Raybestos" Brake Lining.

An excellent brake lining that is both durable and efficient is that known as "Raybestos," and placed upon the market by Messrs. Brown Bros., Ltd., of Great Eastern Street, London, E.C. This is a material which is productive of more friction than metal when against metal, and we have been reliably informed that cars have travelled 20,000 miles without their Raybestos brake lining showing any material signs of wear. The feature of the material is indicated clearly in the accompanying illustration, from which it will be seen that it is composed of asbestos woven with brass wire. It will neither burn nor carbonise in any heat, and has been subjected to many extremes, withstanding all to the satisfaction of the experts. Raybestos is supplied in two thicknesses, and has already proved its merits—a fact which adds confidence to our recommendation.

Fig. 2.

Raybestos is supplied in two thicknesses, and has already proved its merits—a fact which adds confidence to our recommendation.

The "Orno" Nut-catcher.

Messrs. G. T. Riches, Ltd., of 19, Store Street, London, W.C., are always taking up new lines in accessories, &c., for the comfort and convenience of motorists or the economical running of cars. Their latest speciality is the Orno combined nut-catcher and torch illustrated in Fig. 3. This is an electro-magnetic tool sufficiently powerful to attract and hold spanners, bolts, nuts, &c., up to about 3 lbs. in weight. It is used in connection with a four-volt accumulator, and those motorists who have experienced difficulty in reaching bolts and nuts which fall into the mud shield will appreciate the value of this device. The simplicity of construction is clearly seen in the illustration, and as its service is not affected by oil or grease it will be found useful for removing loose pieces of metal which may have become mixed up with the contents of the gear-box. The ease with which it recovers missing articles which have rolled away into odd corners is a really remarkable feature. Another point in connection with the tool is that it can be made to perform a dual purpose, the head being detachable, so that it can be readily replaced by a small electric lamp for inspection purposes. The tool is nickel

Fig. 3.

plated, and with five feet of flexible wire should prove a popular accessory on the car.

The Samson Tyre.

Having observed the good features of the Samson non-skid tyre at the last motor show in London, we have taken occasion to watch its behaviour in actual service. This has been very satisfactory, and the Samson (Licensed) Rubber Company, of Hythe Road, Willesden, N.W., have evidently secured a speciality which can well maintain the claims made by the makers. The main feature of the tyre is the provision of diagonal grooves which, in themselves, restrict any tendency on the part of the tyre to deviate from its proper course. In each groove four hardened steel studs are inserted with good effect. Thus 160 studs are fitted to do the work previously performed by six times that number, the manner of their fitting rendering the service equally efficient. There is, however, a saving of weight which is very material, while the injury caused by

the generation of heat from nearly a thousand studs is obviated. This is a most important consideration. Recently the company have instituted a new method of fixing the studs in the tyre which secures them a great advantage. The usual method of attaching these in the form of a bifurcated stud has been abandoned, the breaking of one or both of the prongs being a frequent cause of looseness. When the system is adopted, too, the case-hardening of the stud itself is never too well done. Now, however, the Samson Company has got over both weaknesses by having the head of the stud perfectly case-hardened as a separate piece. This is then sunk upon the portion coming up through the tyre, and cannot possibly get away. The sunken centre of the stud further contributes to the non-skidding effect of the device, and altogether the new stud gives the Samson tyre ability to withstand the roughest treatment on the most greasy roads.

The "Ward" Cape Hood Extender.

We illustrate in Figs. 4, 5, and 6 the Cape hood extender which has recently been put on the market by Messrs. George Ward and Co., of the Central Garage, Gordon Street, Southport, to facilitate the raising and lowering of Cape hoods, the makers claiming that the arrangement enables this to be done single-handed and from the inside of the car. Many motorists know from experience how inconvenient it is to have to get out of the vehicle and to stand in the rain whilst fixing the Cape hood in position, while it is nearly always necessary to have two persons to manipulate the hood. As will be seen from the drawings, the "Ward"

Fig. 4.

Figs. 5 and 6.

device consists of a pair of telescopic rods A, upon which loose lugs are fitted, which can be moved along to enable the forward portion of the hood to be put into position. A pair of brackets which bolt into the existing eyes on the front seats are also supplied; these brackets receive the ends of the rods when in position for raising the hood. The extender rods are pivoted to the eyes in the back brackets where the front portion usually goes when the hood is down. The forward portion is fixed into the lugs on sliding rods, and always remains so fixed, the whole folding flat when not in use. When the hood is to be raised, the telescopic rods are brought down to the front brackets, where they automatically secure themselves. All that remains to be done is to slide the front portion of the hood along the rods into position, where it can be locked with the thumb screw in the lug, and the rods lifted clear to allow admittance to the car, as shown in Fig. 5. The rods when in this position clip to the uprights at rear of hood. Messrs. Ward inform us that the arrangement can be fitted to existing hoods in three minutes.

At their establishment in Cheapside, London, E.C., Messrs. Benet, Link and Company, Ltd., are giving practical demonstrations of the economical method of electric lighting by means of metallic-filament.

CAPT. THEO MASUI, the sole concessionaire for Germain and Greig cars, has just purchased the stock and goodwill of the Chester and North Wales Motor and Garage Company, Ltd., City Road, Chester which he will completely reorganise, and where a full stock of cars, tyres lamps, &c., will be held.

THE "GATE CHANGE" PATENT.

AS we mentioned in our last issue, a report is current in motoring circles to the effect that the British representatives of the holders of the patents relating to the Mercedes cars, particularly as regards the "gate change," are about to make a demand for a royalty on all chassis fitted with the same. The claim is based on the patent applied for on May 9th, 1899, by, and granted to the late Herr Gottlieb Daimler, of Cannstatt, Wurttemberg, for "engaging and disengaging devices for gearing." As the patent No. 9805, 1899, is one of which much is likely to be heard in the near future, we reproduce below the complete specification as also the drawings appended to the same:—

The present invention relates to a gearing, and more especially to engaging and disengaging devices in an arrangement of gearing in which the driving shaft is connected to the motor shaft by means of a friction coupling actuated by spring pressure, and in which an alteration in the gearing of the toothed wheels can be effected only after the friction coupling and the toothed wheels have been put completely out of gear.

The chief feature of my invention, in view of the devices hitherto used, consists in an arrangement whereby the actuation of the friction coupling is effected by moving a hand lever which serves at the same time to alter the position of the toothed wheels. A further important advantage is

obtained in that my mechanism can be used for gearing which consists of two or more pairs of toothed wheels, and whereby the relative positions of these wheels can only be altered after the hand lever has been placed in its middle position, thereby disengaging all the toothed wheels. Further, by means of my arrangement it is possible to reverse the direction of rotation of the driving shaft. I attain this object by the employment of an intermediate wheel. Also this intermediate wheel can only be actuated after the gearing is completely out of gear by bringing the hand-lever to its middle position.

My invention will be more fully described with reference to the drawings filed with the provisional specification, in which the gearing consists of two and four pairs of wheels, and in which: Fig. 1 shows a section through the gearing, which consists of two pairs of wheels, the hand lever being in the middle position. Fig. 2 illustrates a section through the gearing, where the friction coupling device has been put into gear and two spur-wheels engage with each other. Fig. 3 represents a section through gearing consisting of four pairs of toothed wheels. Fig. 4 is a plan of the quadrant. Fig. 5 a transverse section through the same, illustrating clearly the hand lever H and its details. Fig. 6 is a detail of the lower part of the hand-lever in plan. Fig. 7 represents a view similar to Figs. 3 and 4, the coupling device and one pair of spur wheels being shown in gear. Fig. 8 is a transverse section through Fig. 7. Fig. 9 is a detail view of the lower extremity of the hand lever H in plan. Fig. 10 is a detail view of the hand lever H and its connections. Fig. 11 is a plan of Fig. 10 partly in section. Fig. 12 is an elevation partly in section of mechanism for reversing the direction of rotation of the driving shaft. Fig. 13 is a transverse section through Fig. 12 showing the hand lever and its connections. Fig. 14 is a plan of Fig. 12. Fig. 15 illustrates another position of the mechanism represented in Figs. 13-16. Fig. 16 is a transverse section of Fig. 15. Fig. 17 is a plan of the same. Figs. 18 and 19 are detail views of the quadrant M.

A is the friction coupling box driven directly by the motor shaft. This friction coupling box encloses a friction cone D fixed to a shaft B, which at one end runs in a bearing in the motor shaft, and on the other end within a bush C. This shaft B can be moved horizontally. Loosely mounted on the shaft B are the toothed wheels E¹ E². Another pair of toothed wheels F¹ F² is rigidly connected to the countershaft G. From the latter motion is communicated further in any suitable and known manner. A hand lever H is provided for the purpose of altering the relative position of the toothed wheels E¹ E². This hand lever is connected to a rod J¹ guided through a casing. By means of this hand lever H and the rod J¹ the toothed wheels E¹ E² can be altered in position so as to engage either with the wheel F¹ or F². A spring L is suitably attached above the sliding rod J¹ for the purpose of pressing the friction cone D into its casing A. The hand-lever H is shown in its middle position and the toothed wheels E¹ E² engage neither with F¹ nor with F².

The shaft B and consequently the friction cone D is in connection with a lever mechanism consisting of the lever K and rod i. By means of this lever mechanism the friction cone can be pressed into this casing or can be withdrawn. The spring L arranged above the rod J¹ acts in such a manner as to draw the lever K in the direction of the friction cone, so that this latter will be pressed into its friction box A. The hand-lever H is provided with a nose h¹ having a semi-circular surface. When now

obtained in that my mechanism can be used for gearing which consists of two or more pairs of toothed wheels, and whereby the relative positions of these wheels can only be altered after the hand lever has been placed in its middle position, thereby disengaging all the toothed wheels. Further, by means of my arrangement it is possible to reverse the direction of rotation of the driving shaft. I attain this object by the employment of an intermediate wheel. Also this intermediate wheel can only be actuated after the gearing is completely out of gear by bringing the hand-lever to its middle position.

My invention will be more fully described with reference to the drawings filed with the provisional specification, in which the gearing consists of two and four pairs of wheels, and in which: Fig. 1 shows a section through the gearing, which consists of two pairs of wheels, the hand lever being in the middle position. Fig. 2 illustrates a section through the gearing, where the friction coupling device has been put into gear and two spur-wheels engage with each other. Fig. 3 represents a section through gearing consisting of four pairs of toothed wheels. Fig. 4 is a plan of the quadrant. Fig. 5 a transverse section through the same, illustrating clearly the hand lever H and its details. Fig. 6 is a detail of the lower part of the hand-lever in plan. Fig. 7 represents a view similar to Figs. 3 and 4, the coupling device and one pair of spur wheels being shown in gear. Fig. 8 is a transverse section through Fig. 7. Fig. 9 is a detail view of the lower extremity of the hand lever H in plan. Fig. 10 is a detail view of the hand lever H and its connections. Fig. 11 is a plan of Fig. 10 partly in section. Fig. 12 is an elevation partly in section of mechanism for reversing the direction of rotation of the driving shaft. Fig. 13 is a transverse section through Fig. 12 showing the hand lever and its connections.

the hand-lever H is in its middle position the nose h¹ will abut against the end of the rod i and the friction coupling and the wheels will be put out of gear, as shown in Fig. 1. If now the hand-lever H is drawn for instance to the left, as shown in Fig. 2, the toothed wheel E¹ comes into engagement with the toothed wheel F¹ rigidly connected to the countershaft G. The nose h¹ by the same movement of the hand-lever H liberates the rod i. Thereupon the spring L comes into action and draws the lever K to the left, whereby the friction cone D is pressed into its casing A. The hand-lever H moves in a special guide or quadrant M arranged for the purpose to determine the motions of the lever, as well as to fix a middle position. When the hand-lever is brought into its middle position, the friction coupling will be disengaged as already explained. This device can also be employed in gearing consisting of four or more pairs of toothed wheels. Gearing consisting of four pairs of toothed wheels is represented in Figs. 3-9. In this construction besides the parts before described one additional pair of toothed wheels F³ F⁴ rigidly connected to the countershaft G and a corresponding pair E³ E⁴ loosely mounted on the driving shaft B are provided. For changing the position of the two pairs of toothed wheels E¹ E² and E³ E⁴ I employ two rods J¹ and J²; the construction is similar to that described in Figs. 1 and 2. These two rods J¹ J² at one end are each provided with teeth engaging with a segment h² of the hand lever H. The hand lever can be moved axially on its pivot pin, so that its segment h² can alternately be brought into connection with the rod J¹ or J². By means of this arrangement it is possible to move either the one or the other pair of the toothed wheels forward or backward.

(To be concluded.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

HOW SHOULD WE PASS TRAMCARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I trust you will open your columns to a discussion of the problem raised by the decision of the Court of Appeal in the Bradford case, to which you referred in your last issue. Your Comment will be endorsed by every practical motorist, and the authorities concerned with the regulation of tramway traffic must see the rightness of the opinions expressed by the Lord Chief Justice. How the Local Government Board came to issue such a regulation as that which formed the reason for the prosecution I cannot comprehend. It surely is discarded in every town, and not one motorist in a hundred obeys its ridiculous rule.

Has not the time come for a revision of the law as concerns the travel of trams generally? They scuttle along at a great pace, the drivers generally in blissful ignorance of their real rate of speed. Then they suddenly draw up in such a way as to constitute a great danger to traffic coming from the rear. Could not a coloured disc be shown from the rear when the driver intended to stop? Something of that kind is becoming absolutely necessary for the safety of other users of the road.

Anyhow, one thing should be done by every motorist. Never attempt to pass a car, or a motor-bus for the matter of that, when passengers are alighting. Disobedience to such a precaution may cause

out being used. Would it be best to partially discharge these and then recharge them? I understand it is injurious to accumulators to let them stand without being charged and discharged. I should also like to know whether accumulators should be entirely discharged before emptying the acid in order to clean them. If so, how should they be discharged?—Yours truly,

NOVICE.

[An accumulator which is to stand idle can be treated in two ways, either of which can be selected to suit the convenience of the user. It should either be thoroughly discharged or kept thoroughly well charged, in which latter case it is, of course, always ready for use. In the first instance, proceed as follows:—Thoroughly discharge the accumulator by connecting it to a 4-volt lamp or a coil of iron wire until it has discharged down to 1½ volts per cell, or 3·5 volts for a 4-volt set. Immediately after discharge, empty the acid out, and rinse the cells with water until they are quite free from acid in the plates or in the cell. Then drain it out and thoroughly dry the terminals and top of the case. Carefully vaseline the terminals and rubber bands to keep the latter soft, and put away in a card box to prevent dust settling on the top. In the second instance, charge up the accumulator so that it can be said to be thoroughly well charged. If there is a connecting wire joining the two cells together at the terminals, take this away, as it leaves the two

Touring in France.—Lamartine's House at St. Point, near Macon.

accident—and we motorists cannot be too careful, not only from feelings of humanity but from the point of view of the welfare of the motor movement.—Yours truly,

A. SYMONS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to my letter of the 14th inst. (see page 1012) I have now seen your article on the above subject.

I had not realised before that both tramcars were stationary at the time of the alleged offence. The situation seems to me to be Gilbertine. The motorist cannot overtake the car which had been proceeding in the same direction as himself on what the judges hold to be the right side of the road without at the same time infringing the law as to passing the other standing tramcar. Also I should think a point might be made of the fact that the cars being stationary the motorist might be said to be passing both vehicles instead of overtaking them.

If any other form of vehicle came to a standstill in the middle of the road, no matter in which direction it has been travelling previously, I should hold that another moving vehicle would be at liberty to pass on either side where it had the most room.

Of course I do not profess to be stating any legal opinion, as I only look at the matter from a common sense point of view.—Yours truly,

J. E. HODGKIN.

Hon. Sec. North-Eastern A.A.

THE CARE OF ACCUMULATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would give me some hints as to how an accumulator which is not in constant use should be treated. I have two accumulators, and they often have to stand for several months with-

cells with their pressure divided. See that the top of the cell is very clean and vaseline the terminals and rubbers; take out the vent corks, as they cause spraying. After three months charge up again if the accumulator appears to have lost its voltage. After an accumulator has been once properly formed, it is not necessary to charge and discharge it when standing, provided it has received a good charge before standing. The easiest method of discharging is by connecting a lamp up to the terminals and leaving it until quite out.]

ACCESSIBILITY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Nothing is more deceiving than the apparent simplicity of some cars that are, in reality, extremely difficult to get at when the time actually comes to make a repair by the roadside. This is particularly the case with some of those cars which—in chassis form at a show—present a remarkably clean and simple appearance. One is often told, for instance, that “All you have to do to remove the magneto is to undo those two nuts and the magneto will come away,” but when it comes to undoing those two nuts, although they look eminently accessible and easy to reach, it may be found that it requires a human snake with special spanners to get them off, and that it is then a long job to manoeuvre the magneto out of its resting place.

In the same way, one often sees a carburettor which looks as if the whole thing could be dismantled in a few minutes, whereas it is really necessary to remove the inlet-pipe complete before the body of the carburettor will come away, and it may then be necessary to break two or three more joints before the jet can be reached. And here I should like to plead strenuously for an instantly detachable jet on every carburettor made. The stopping-up of the jet is about the only serious trouble that one experiences with good carburettors nowadays, and, in spite of it being

the easiest thing in the world to arrange the jet so that it can be instantly detached (by forming it with a hexagon-shaped base which extends outside the body of the carburettor) it is very much the exception to find a jet made in this way. An easily dismountable jet also makes tuning up far easier and tends towards better efficiency and petrol economy. When it takes two hours to remove and replace the jet one is not tempted to make the experimental adjustments for obtaining the greatest power and efficiency, which one would readily do when these adjustments are quickly done. Everyone who buys a car, particularly those who look after their own vehicles, should convince himself—it is even more important in the case of “herself”—that the accessibility of every part is real and not merely apparent—two very different things.—Yours truly,

EXPERIENTIA DOCET.

BALL-BEARING CRANKSHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There has been a good deal of discussion lately on the subject of ball-bearing crankshafts, but I do not think I have seen the position reviewed in the light of what practical experience has demonstrated in the past, together with what present-day developments foreshadow in this direction. The fact is that the theory and practice of ideal ball-bearing crankshafts—practice, that is, as regards ease and convenience of manu-

seems to indicate that this principle is correct and may prove the eventual solution of the ball-bearing crankshaft question.—Yours truly,

180141 10754 11481 ENGINEER.

A CLUTCH QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should feel greatly obliged if you would let me know, through the interesting columns of the *M.C.J.*, if a leather-faced plate clutch requires any special treatment. Should it receive lubrication of any sort? What should one do in the case of the clutch slipping; or, on the other hand, of it becoming too fierce? Are there any English or French cars fitted with such a clutch?

Also, is a coil made specially to be used in conjunction with a 6-volt accumulator likely to cause misfiring if a 4-volt battery only is used?—Yours truly,

AN INQUISITIVE NOVICE.

[The leather should be kept dressed with oil to prevent its becoming dry and hard. Various kinds of oil are advocated, among which castor oil is perhaps the most popular, although neat's foot oil is really better. A mixture of castor oil with a little paraffin soaks in very well. The best way to ensure the dressing permeating the leather thoroughly is to

M. Sisalre and M. Naudin practising on a covered cycle track in Paris in preparation for a speed trial to be held in the near future.

facture—are directly opposed. The ideal ball-bearing is as small in diameter as possible with very large balls, so that the speed of rotation is kept low and wear is thereby reduced. But the difficulty arises from the fact that with a one-piece crankshaft it is impossible to pass a small ball-ring over the cheeks of the crank, and consequently resort has to be had to a large ball-ring with comparatively small balls. For, with a bearing that can be easily fitted, using large balls, the size will be so great that the speed of revolution of the balls is considerably increased.

This difficulty has been cleverly overcome in the case of one English car by using a built-up crankshaft which, from the careful and ingenious way in which the design has been carried out, appears to be entirely successful. By building up the crankshafts the ball races do not have to be passed over the crank-cheeks, so that they can be kept small in diameter, although very large balls are used. This would seem to be a very satisfactory way of effecting the necessary compromise.

The fact that one of the leading engineering firms—Hotchkiss—and the Mercedes Company have abandoned ball-bearing crankshafts shows that these two experienced makers were not satisfied with them, and, in the case of both cars, the crankshafts were in one piece. It must be remembered, too, that the Hotchkiss Company originated this form of crankshaft and would not have abandoned it without very good reason; at the same time it is interesting to notice that the Mercedes Company even fitted ball bearings to the connecting rod big ends on a few of their cars, but soon dropped the practice. The success of the built-up crankshaft

soak the latter in tepid water, and afterwards, as it is drying, to paint the surface continually with the oil. The water soaking opens the pores of the leather and as the water dries out the oil is sucked in. If the clutch slips when the leather is properly dressed, a stronger spring should be fitted; or, if there is means provided for adjusting the present spring, it might be tightened up, and *vice versa* if too fierce. Plate clutches are used by De Dion, but they are not covered with leather, but we believe that one or more of the American cars have leather-covered plate clutches. A German car, the Bugatti Hermes, had a plate clutch, but this again was metal-to-metal. With regard to the 6-volt coil, this being designed for use with a 6-volt battery is very likely to be irregular in action if used with only a 4-volt accumulator.

STARTING HANDLE FOUND.—In Fenton (Staffs.) a starting handle has just been found by a small boy. It can be obtained on application to Mr. Alfred Meigh, Ash Hall, Stoke-on-Trent.

MESSRS. BRANWIN, CLARK, WISE AND CO., Milton House, Chiswell Str et, London, E.C., ask us to mention that they are open to receive on behalf of a Colonial firm catalogues of motor-cars and cycles with prices.

“PARTINGTON” writes:—“Will those motorists who have had experiences of dissolve acetylene write their experience of the same, stating whether it has proved satisfactory and how it compares with the ordinary acetylene lamp and generator?”

CLUBS AND ASSOCIATIONS.

ROYAL.

THE first annual dinner of the Royal Automobile Club and Associate Clubs was held at the Hotel Cecil, London, on the 14th inst., when Prince Francis of Teck, K.C.V.O., presided over a gathering of 380 ladies and gentlemen who are interested in the development of motoring. Those present included H.S.B. Prince Alexander of Teck, the Earl of Kimberley, K.G., Lord Montagu, and the gentlemen whose names appear below as speakers, Sir David Salomons, Major H. C. L. Holden, Messrs. W. H. Allen, J.P., W. Worby Beaumont, Dr. E. F. Bindloss, Dr. W. H. Copeland, C. Cordingley, Capt. F. S. Dyke Acland, T. W. Staplee Firth, A. W. Gamage, Charles Hardy, E. H. Hepper, Granville Kenyon, E. M. C. Instone, G. H. Smith, G. E. Learoyd, J. Stewart Mallam, H. B. Maybury, Mervyn O'Gorman, A. Lyle Rathbone, Percy Richardson, W. E. Rowcliffe, J. Lyons Samson, F. Thoresby, R. Todd, W. A. Vincent, T. H. Woollen, and many other gentlemen well known in club and motoring circles.

After the loyal toasts had been enthusiastically honoured that of "The Naval and Military Forces" was proposed by Mr. G. C. Ashton Jonson, in a speech scintillating with references to doughty deeds and full of admiration for the heroes of both services. Vice-Admiral Sir Charles Campbell, K.C.M.G., responded for the former, and Sir Henry Rawlinson, Bart., C.V.O., for the latter. Sir Henry referred to the assistance that motorists could render the Army, and trusted that their help would always be as readily given as had been the case hitherto. The internal combustion engine would not only be of service to the defensive forces on land but it promised to go into the air with equal success.

Lord Montagu, proposing the toast of "Automobilism," said that a few years ago motoring might have been said to have been the sport of the rich, but now it was enjoyed by all classes, and was no more confined to any one class than was any other form of locomotion. With the extension of the use of the motor-car to all classes the road was only coming back to its own. It had been said that the users of motor-cars looked upon roads as if no pedestrian should ever be allowed to wander upon them. But no motorist ever desired to interfere with the legitimate rights of the pedestrians; all the motor-car users wanted was the freest road they could get with the smallest number of obstructions—whether moving or fixed. They desired to show courtesy perforce to the fixed obstruction and the greatest goodwill to the obstruction that moved. It lay in the power of motor-car users to see that automobilism was worthily represented throughout the country. He was glad to notice that the abuse of automobilism was diminishing rapidly, and that arose not only from a better understanding of what automobilists were, but also because of more considerate driving on the part of automobilists themselves. There was a remarkable difference between the way in which cars were driven to-day and the way in which they had been driven five or six years ago. No vehicle in the London streets was driven with more consideration than the motor-car. In the agitation for a change of the law motor-car users must beware lest they fell out of the frying-pan into the fire. They knew the evils they had now to endure, and new evils cropped up every day. Even a few days ago they had learnt that they must always pass a tramcar on the off-side. What would Sir Edward Henry do if he (Lord Montagu) drove over Westminster Bridge and tried to observe that judgment? As long as the law remained what it was motor-car users must abide by it. There was a tendency to treat them more fairly on the part of the police and the magistrates, and that tendency should make them less willing to see any change in the law unless they were sure that it would be to their advantage.

Prince Francis of Teck responded, and referred to the great amount of employment the motor-car industry gave to the working classes and the prosperity it had brought to country inns and hotels. During the past year the membership of the Club had increased by 1,200 members, that of the Scottish Club by 181 members, and that of the Irish Club by 100 members. In the last year thirty-seven clubs in the various counties of the United Kingdom had thrown in their lot with the Club, representing 6,917 members. The Auto-Cycle Union had brought in thirty-six clubs, with 2,253 members. The total membership of the seventy-three associated clubs was 9,170, and the number of individuals in those clubs and in the national automobile clubs was 14,495. In 1905 there were 95,000 registered cars in the country; now there were 195,000.

Mr. A. Armitage, J.P., proposed "Our Guests," responses being made by the Earl of Kimberley and Mr. H. T. Rutter.

Sir Edward Henry, the Commissioner of Police for the Metropolis, in proposing "The Chairman," expressed the obligation which he said the police were under to the chairman and the committee of the Royal A.C. for the help they were always ready to give the police when it was required. The newspaper correspondence last year indicated that there was considerable public disquietude on the subject of motor-car driving. Nothing was so calculated to remove such scares as a belief on the part of the public that such organisations as this club were endeavouring to control dangerous and inconsiderate driving. That had always been the attitude of the Royal A.C. The force of example and the pressure of public opinion had reduced drunkenness in this country, and the abuses of motor driving could be cured by the same influences. There would always be a limited number of persons who must be left to the police, but he looked forward to the time when dangerous driving would come under the same opprobrium as drunkenness, and would be universally recognised as "bad form." Social sanction was and always had been more potent than penal sanction.

Prince Francis in his reply made the announcement that the Brooklands A.R.C. had made the offer to admit to membership of that club any member or associate of the R.A.C. at the reduced fee of two guineas per annum, provided 1,000 members and associates availed themselves of the offer. He further remarked that, while England was often accused of lagging behind in automobilism and aviation, it had through the enterprise of Mr. Locke-King outstripped all other nations in having the only motor track in the world, and this being so it was in his opinion the duty of all those who enjoyed the sport of automobilism to support Mr. Locke-King by every means in their power, as, entirely apart from the racing side of the venture, the track was undoubtedly an invaluable asset for testing cars and proving their merits.

BROOKLANDS.

THE offer of the Brooklands A.R.C. to receive members of the R.A.C. in its ranks for an annual subscription of two guineas for the year commencing on March 1st is being well taken up. The condition attached is that 1,000 new names are received by that date.

Miss Edith Paterson has established the first lady-driver's record on Brooklands Motor Track by running a 16-h.p. Imperia car fitted with Dunlop tyres for an hour continuously, the total mileage in that time being approximately fifty-three miles, while the fastest lap was done at a fraction over fifty-five miles an hour.

SOUTHEAD AND DISTRICT.

THE second annual general meeting of the Southend and District Motor Club will be held on Tuesday next at the Hotel Victoria, Southend, when the committee's report will be considered. This will review the various social events of the year as well as the activity of the Essex county police.

During 1908 the club was the means of rendering assistance to members in many ways, such as in connection with exceeding the legal limit, claims in respect of patent rights by the De Dion-Bouton Company, matters of insurance, unsatisfactory hotels, &c. Captain Newman not being any longer politically connected with the district, has sent in his resignation as president of the club, and the committee is now endeavouring to fill the vacancy. As we have already announced, Mr. A. Warnery is resigning the hon. secretaryship and Mr. H. Greenfield has been invited to become his successor.

BLACKHEATH.

THE annual general meeting of the Blackheath A.C. will be held at 12, Charlton Road, Blackheath, on the 28th inst., when fifty active and five honorary members will be reported in the ranks of the club. The finances are in a satisfactory state, a balance of £13 19s. being carried forward. Lately the club has supplied the Greenwich Borough Council with two danger signs to be erected at Blackheath. The committee have agreed to affiliate with the M.U., and a resolution confirming this decision will be submitted to the meeting. At the same gathering the programme for the coming season will be discussed and an endeavour made to arouse the enthusiasm of members in the proceedings of 1909.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

MR. A. J. WILSON, of 154, Clerkenwell Road, London, E.C., the general hon. sec. of this fund, sends us a copy of the report for 1909, which contains a list of members, the rules of the Fund, bye-laws for the management of branch centres and a balance-sheet showing that the funds in hand exceed £7,000. We commend the society to the attention of all engaged in the motor trade, and anticipate that its usefulness will considerably increase as the years go on.

INSTITUTION OF AUTOMOBILE ENGINEERS.

THE R.A.C. has accepted the invitation of the Incorporated Institution of Automobile Engineers to appoint delegates to serve on the Research Committee now being formed by the Institution to investigate the relations of the dimensions of a petrol engine to the horse-power developed.

SUSSEX MOTOR YACHT CLUB.

THE second annual dinner of the Sussex Motor Yacht Club was held on Saturday evening at the headquarters of the club in Middle Street, Brighton, Sir Theodore Angier presiding.

During the evening the Rear-Commander, Lieutenant O. Summer, R.N.R., who was in the vice-chair, read an interesting paper on "Rudders and Helmsmanship." The author, who is also the hon. secretary of the International Motor Yacht Racing Association, submitted facts and data for the benefit of the amateur owner, in order to render him less dependent on the advice of the maker or the paid hand.

BRITISH MOTOR-BOAT CLUB NOTES.

IN order to comply with the B.M.B.C. rule that boats shall not bear any trade name, the secretary has been informed that Mr. F. S. Edge's Napier Major will be called Major and the new eight metre racing boat which he is having built will be called Lucinha. The new boat which Mr. Mawdsley Brooke will be racing will be called Baby III.

AEROPLANE.

THE first annual dinner of the Aeroplane Club of Great Britain and Ireland was held at the Savoy Hotel, London, on Wednesday of last week, Mr. Horridge, K.C., M.P., being in the chair. Among the company present, which numbered 160, were Captain Ferber, aeroplane expert of the French army; Major Baden-Powell, Mr. F. W. W. Hutchinson, Mr. Roger Wallace, K.C., the president of the Aero Club, the Prince of Kapsorphala, Colonel H. S. Massy, C.B., Sir C. Champion de Crespigny, Colonel Mark Mayhew, and Major Templer.

Colonel H. S. Massy, proposing the toast of "The Club," said that it had only been in existence three months and yet it had 950 members. Englishmen were a little bit behind hand in these matters, he added, but they would no doubt muddle along in the old English fashion, and in the end English grit would place them at the head of the nations in the science of aeroplanes.

The Chairman, replying, remarked that all members wished the best possible inventions to be discovered in their club for the protection of the military interests of Great Britain against the world. The old saying on leaving home in the morning, "We are going to take the air," would have a new meaning in the future. When that was done, they would have to consider new conditions, and he foresaw great difficulties, say, in regard to the safety limit. It seemed almost impossible to imagine two policemen, in respective aeroplanes, busy taking tests on the measured

ROAD REPORTS.

TEN MILE LIMITS IN SURREY AND SUSSEX.

The Local Government Board have made regulations for a speed of ten miles an hour for motor cars on the following highways: (1) Through the village of Hersham, from the Congregational Chapel along Hersham Road and Queen's Road, to Westcar's Lane, a distance of 1,250 yards; (2) so much of Bridge Street, Walton, as extends for a distance of 500 yards from Church Street to Mount Felix; and (3) High Street and Chertsey Road, Woking, for a distance of 600 yards from Duke Street. These regulations come into force on Monday next.

Applications for similar limitations of speeds have also been the subject of public inquiries at Mayfield and Cowfold, opposition being made on behalf of the M.U. by Mr. Rees Jeffreys, and of the R.A.C. by Mr. G. Dean.

ACTON.—A new thoroughfare 50 ft. wide is to be made from High Street, Acton, to Mill Hill Road, running into Park Road North. Later a road will probably be built across the North London Railway at South Acton, so that vehicular traffic may have a straight route through to Acton Green and Chiswick.

HEREFORDSHIRE.—From a report of the Roads and Bridges Committee, presented at a meeting of the Herefordshire County Council, it appeared that the County Surveyor, Mr. G. H. Jack, did not favour the tar

One of the Motor-Cars used in the recent Military Manœuvres in Germany.

[Allgemeine Automobil Zeitung.]

mile in the air. There would be rules of the air, as there were rules of the sea. With the aeroplane it would be possible to discover the North or South Pole in three or four hours from the jump-off, travelling, as they would do, 300 miles an hour. Custom House officers would be no longer required, as people would fly into other countries without being stopped at the frontiers.

Colonel H. S. Massy also foresaw the arrival of the aeroplane. It was inevitable that, if we wished to go any faster, we must abandon the roads and take to the air. "There, at least," he said, "there will be no more bursting tyres, and we shall be no longer smothered with dust; no more sharp corners, no dangerous hills, no cross roads, no heaps of stones, no flocks of sheep, nor Saturday bicycle clubs. I was about to say no policemen, but that would be too much optimism; and I now prophesy, on the contrary, that the most exciting part of future existence will be a speed of 300 miles an hour, with a police-plane in hot pursuit." The aeroplane, he thought, would not come into use as an aid to scientific and industrial or commercial undertakings so rapidly as it would for various other purposes. Man, who was essentially a bellicose and quarrelsome animal, was already arranging for its use as an engine of war.

THE Motor Cycling Club has resolved to discontinue affiliation with the A.C.U. for 1909.

painting of roads as a lasting success. He had lately seen some roads in Breconshire constructed under a new process, which affected the whole of the crust and not the surface only. There was no oil or tar in the process. He was much impressed with the appearance of the roads after much motor and other traffic. He was informed that the life was at least three years, and the cost from 1½d. to 2d. a yard over and above the cost of a water-bound road. If this were so it would be much more economical than tar. It could be laid down in any weather, and overcame the great difficulty of slipperiness, which were two very important considerations. The committee resolved to give no rural or urban districts consent to their tarring the roads.

SUSSEX.—It is intended to repair the following main roads in East Sussex during the week:—Between Muddleswood and Henfield; Clayton and Ditchling; Haywards Heath and Ardingly; Lewes and Shortgate; Newhaven and Rottingdean; Wadhurst and Lamberhurst; Eridge Station and Tunbridge Wells; Catsfield and Battle; Bodiam and Staple-cross.

MESSRS. EASTON AND MELVILLE, LTD., 85, Shaftesbury Avenue, send a neat waistcoat calendar for 1909, which also serves as a reminder of their Ilo lubricating oil, which is well known to motorists.

INTERNAL COMBUSTION-ENGINEED BOATS.*

By F. R. S. BIRCHAM.

For the sake of clearness, I have divided up the boats into classes A, small, entirely open boats, such as dinghies; B, larger, open or partly decked boats; C, cabin boats; D, fishing and commercial boats; E, racing installations.

In each of the above classes we shall find features in the design, installation and use particularly applicable to it; and to make the various details forming the installations clear they may be divided as follows:—1. Engines. 2. Lubrication. 3. Ignition. 4. Exhaust and water services. 5. Fuel supply. 6. Installation in boat. 7. Shafting and propellers. 8. Clutches and reversing arrangements. 9. Control.

In class A the engines are of necessity placed in close proximity to the passengers, and owing to this and to their liability to rust there should be as few outside moving parts as possible. What there are should be efficiently protected. In class B there is not the need for the extreme compactness and protection of parts from mechanical injury as in the smaller boats. This is owing to the fact that engine cases are nearly always fitted. In many of the lower powered and smaller of these boats, horizontal motors under cross thwarts would be a distinct advantage, giving greater neatness to the boat and more room. In class C there is not the need of designs for running in the open without protection, nor is there the need for the extreme compactness. It will indeed be better to design these engines for accessibility. Design must therefore tend to simplicity of overhaul in place. For class D engines cannot be too simple. Very large bearing surfaces, either ring or wick lubricated, answer best, with the addition of splash lubrication in the crank case. The crank case can be of a box form of

One of the Aries Single Deck Motor-Buses recently supplied for a service in Hungary.

iron casting enclosing all gear of whatever kind. The engines will be required to run without attention for long periods, and often for weeks without skilled attention. They should be so designed that nothing is likely to wear unduly, nor require attention inside the crank-case for at least a fishing season. Racing engines are a class by themselves. There is no limit to the amount of originality that can be used in their design. No racing formula limiting the design in any way should for a moment be considered, as it is these engines that show what can be done with advantage and safety in standard practice. They are intended to give as much power as possible in given cylinder dimensions or for a given consumption, and to go on giving this power indefinitely. Special arrangements are made as to cooling, and generally large bearing surfaces are advisable. The working parts must be specially light, and all valves and passages specially large and free from obstructions.

The only really satisfactory lubricant system for marine work is the forced feed system, except, perhaps, for the smallest sizes. It gives perfect lubrication, is constant, and requires no attention. At most the only extra working parts are those of the pump and its drive. A pressure gauge indicates when all is well. Pressure may be regulated either automatically by a relief valve or by hand with a three-way cock; in each case the oil is returned to the crank case. It is simple to cool the oil by pumping it through a cooler or through a pipe running outside the boat, and this, besides saving oil, results in far cooler bearings. A service tank of large capacity may be placed in the oil system, so that when once filled no further attention is required until all is used up, the time depending on the heat and the wastefulness of

the engine and size of tank. No other system should be adopted for other than the smallest engines or those running at very moderate speeds with low bearing pressures.

The worst work that is seen about installations, without exception, is the ignition. Turning to our various classes of boats, A requires rather special treatment, which also applies to the smaller engines in class B.

In class A and most small engines of B the ignition is almost invariably high tension or low tension with an induction coil and battery, the cost of the plant being unable to stand the cost of a magneto. As a rule there are separate wires run in every one's way unprotected to the contact-breakers and plug. It appears that there would be no difficulty in casting with the cylinders or bolting on a coil and battery case with a tight rubber jointed cover. From this the high tension lead would run to the plug in a removable casing, or in a flexible tube ending in a plug cover as suggested above. The contact-breaker, if of the eccentric type on two-cycle engines, could also be enclosed in the same case. This would ensure at small cost an excellent system. When engines have more than two cylinders, however, magnetos as a rule are used, when the general suggestions above will apply to the installation. C.—This class will invariably have magnetos of the high tension or low tension types, as well as, possibly, coil ignition as a stand-by. D.—This class must have a simple ignition, and probably the best is low tension magneto ignition with a battery as stand-by and for starting. This, however, may vary according to circumstances and the type of engine. E.—These engines are invariably fitted with high or low tension ignition, preferably the former, and the greatest pains should be taken as to the insulation.

The exhaust arrangements depend very considerably on the arrangement of the accommodation on boats. The simplest, with decked or partly decked boats, is the use of a funnel silencer. This entails the minimum of exhaust piping, and is simple. A.—In this class it is usual to have bare exhaust pipes, asbestos lagged, generally by binding cord round them. This looks rough, and does not fully protect persons and goods from damage. These often are the most costly items in the installation of the plant, owing to each having to be carefully bent to the form of the boat. It would appear that a system might with advantage be worked out in which the circulating water was turned into the exhaust pipe, having a drain of ample area to the sea at the lowest point. Thus all water not carried off as steam would be carried to the sea direct, and some amount of cooling would result. The silencers are a considerable difficulty, there being so little room in which to place them. The usual bark of these small engines in most annoying, and difficult to prevent. It might be avoided if the silencers were placed vertically alongside the engine, and were of a tubular water-cooled type, having much cooling surface, the circulating water passing through them. B., C., D.—Any of the types suggested may be used for these boats except uncooled pipes. These are quite inadmissible. E.—The most usual form of exhaust is that of a plain pipe having the circulating water turned into it. This generally, with the length available, gives sufficient silence. It is a question whether Koerting type ejectors giving an exhaust vacuum will not be found the most efficient arrangement in spite of added weight and the power taken by the water pump.

The system of fuel supply has been thoroughly worked out, and many excellent arrangements are to be found. The points in the designing of the supply and storage are, firstly, that the tanks be thoroughly protected from mechanical injury, and are sufficiently strong in themselves. They should be invariably riveted and brazed, unless weldless steel tanks are used. The latter, although very strong, are liable to rust. In small boats the fore peak is not a suitable place for a tank if it is used for any other purpose. It is usually required for ground tackle. It is, however, the only place from which a gravity feed can be obtained. This in classes A., C., D., is probably the best system, as in the latter classes the tanks can be on deck, and in the former it saves all pressure service and complication.

The installation of machinery in boats is often a most troublesome matter owing to the fact that few of the smaller plants are designed in collaboration with the boat-builder. The aim in the design should be to construct a plant requiring as little fitting in the boat as possible.

Generally, the result to be aimed at is to so instal the whole plant that any part may be removed and replaced with as little work as possible and without the necessity of removing any other part.

Shafting and propellers are sections which it is impossible to discuss fully in the limits of this paper. Propellers are chosen for the work the boat is intended for, a compromise being aimed at where towing is a part of its duties. Generally, speeds of revolution are preferably kept low except in the fastest boats, and in the case of those boats intended for towing yachts this is particularly important. Shafts are preferably of bronze or delta metal, as no trouble will then be caused by corrosion and rust. The strength of these metals is such that shafts of small section may be used.

Nearly all methods of reverse depend on a gear or on reversing propellers, few engines being arranged at present to themselves reverse and re-start readily enough to depend on. The gears used are of many types, some with gear-boxes and separate clutches, others with clutch-gears almost open, and, again, others with totally enclosed clutches running in oil. Of these types the latter is that which only can be called entirely satisfactory. It is preferable, where possible, to include the reverse gear in the engine casting, thus making one unit, or when not possible, to mount it on steel bearers with the engine. In the former

* From a paper on "Some points in the design and use of small internal combustion-engine boats," read before the Incorporated Institution of Automobile Engineers, on January 18th, 1909.

case the flywheel could readily be placed at the forward end of the engine.

In this paper I have attempted shortly, and within the limits of the title, to set out the ordinary practice obtaining in motor-boat work. I have not attempted to include every point, nor to discuss various fuels and their use, nor other than standard two or four cycle engines, but to point out desirable features in boats having any type of engine using any kind of fuel.

CASES AGAINST MOTORISTS.

THE SPECIFICATION OF POLICE TRAPS.

The further hearing of the adjourned summons against E. A. Lastsmith, Drayton Gardens, Kensington, for driving a motor-car at an excessive speed in Morden Road on November 29th, was heard at Wimbledon on the 13th. The case was reported in the *M.C.J.* of January 9th. Mr. Douglas Leechman had objected to the relevancy of the summons, on the ground that it was wanting in specification, and the Bench adjourned the case to consider the point. Mr. Knight appeared for the police, and stated that a measured furlong was covered in 16.5 sec., which was equivalent to over twenty-seven miles an hour. Mr. Leechman objected to the case being stated until the preliminary point raised by him had been decided. His objection was that the summons did not specify the speed the car was going at, over what part of Morden Road the defendant was exceeding the limit, and over what distance he was timed. The Chairman: What it does state is that it was on a public highway, and he was driving at a speed exceeding twenty miles an hour on Morden Road, at 10.40 a.m. on November 29th. Mr. Leechman said that a Scottish complaint to which he had referred alleged contravention of Section 9 of the Motor-Car Act, and in particular over a quarter of a mile at Caterbog Farm, on the Ballock road, Dumbartonshire. The Chairman: He was driving at an excessive speed over a certain quarter of a mile, and he was entitled to know the quarter of a mile. If we had specified that you drove over a specified furlong we would have had to state it. I have been in Scotland and know what they do there. They don't stop the car and the man does not know what charge will be preferred against him. The police take the number and the speed at which the car is travelling, and then he is summoned. After further argument, the objection was repelled, and evidence was given by the police. The defendant and his driver stated that, owing to the condition of the car, it could not run at twenty miles an hour. The Bench imposed a fine of £2 and £1 13s. 6d. costs.

BATCHES.

The Mortlake justices on the 13th inst. imposed fines amounting to £29 on motorists for exceeding the speed limit on the public highway at Barnes Common.

At the Wimbledon Petty Sessions, Mr. J. B. White, the employer of a chauffeur who was summoned for exceeding the speed limit, had a discussion with the chairman with regard to his reliance upon the evidence of police witnesses. Mr. White is also the chairman of a bench of magistrates, and said that he timed the car from milestone to milestone, and was sure they were going very slowly at the time in question. Despite this, however, a fine of £2 and costs was imposed. On the same occasion seven other motorists were fined similar amounts. Two motorists were fined £1 and £2 respectively at Kingston for exceeding the ten mile speed limit in Clarence Street of that borough.

Several cases have lately been heard before the Brighton Borough Bench in which motorists have been summoned, and fined, for leaving motor-cars in the streets unattended.

Several motorists were summoned at Grantham on Saturday for exceeding the speed limit on the Great North Road.

HEAVY DAMAGES.

The Lord Chief Baron and a special jury at Dublin concluded on the 14th inst. the hearing of the case of "Gregg v. the Department of Agriculture and Technical Instruction." The plaintiff, an ex-soldier, residing in Dublin, sought to recover damages for personal injuries which he alleged he had sustained through the negligence of the defendants' servant in driving a motor-car on August 14th. The case for the plaintiff was that he was knocked down by the motor-car a few miles from Inchicore, on the Naas road. Mr. T. W. Russell, M.P., Vice-President of the Department of Agriculture, Mrs. Russell, and the chauffeur were the occupants of the motor-car. The plaintiff had just jumped off a milk-cart and was crossing the road when he was struck. His left leg was fractured, and it was stated by a medical witness that the injury was permanent in its effect. The defendants pleaded contributory neglect on the part of plaintiff. The jury found for plaintiff and awarded £370 damages.

TWO SUMMONSES ON ONE DAY.

Capt. Fletcher was charged at the Sittingbourne (Grantham) Sessions, on Saturday, on two summonses for having driven a motor-car at a speed exceeding twenty miles an hour on the Great North Road on December 22nd. The police evidence showed that the defendant was first trapped south of Grantham, and a few miles north of the town fell into a second trap. He was fined £5 and costs.

The Standard Motor Company, Ltd., have appointed Messrs. Schrader and Co., of 51, Avenue de la Grande Armée, their agents in Paris for the Standard cars, and report that they are already doing a nice business in the French capital.

DE DION-BOUTON PROSPECTUS.

MR. JUSTICE NEVILLE gave judgment on Tuesday in the Chancery Division, in the motion brought by Mr. A. C. Tweedy, of Monmouth, a shareholder in De Dion-Bouton (1907), Ltd., and a further motion by Mr. H. Stonehouse, on behalf of 124 other shareholders, for the rectification of the register of the company and the return of their subscriptions, on the ground of false and misleading statements in the prospectus.

After arguments by counsel for the respondents, his Lordship, without calling upon the applicants, gave judgment in their favour. He said there was no allegation of fraud. The prospectus invited subscriptions to the company to carry on the manufacture of De Dion-Bouton cars. The statement was made that it had been formed to acquire the De Dion patents relating to road and water traction. This was not quite correct. Then there were set out certain patents, said to be De Dion patents, under which the company would be able to manufacture. Was that a true representation? He thought it was remote from the truth. The truth was that the patents which the company was formed to acquire really formed only a small proportion of the patents the acquisition of which would be necessary in order to manufacture the same kind of car as that manufactured in France. His Lordship was of opinion that there had been material misrepresentation, and ordered the rectification of the register and the return of the money paid on the shares by all the applicants, together with costs.

Mr. Astbury, KC. (for the company), said the whole amount—some £5,000—should be paid into court within a fortnight, notice of appeal to be given within that time.

Miss Sheila O'Neill, London's First Lady Professional Chauffeur.

Although Miss O'Neill is not permitted to ply for hire owing to the views of the hackney carriage drivers' licensing authorities, she is for all that kept quite busy with her numerous engagements. Miss O'Neill is to be found at Mr. A. E. Mills's Garage, in Little James Street, W.C., and has proved herself a skilled and practical driver in the crowded streets of the Metropolis. Moreover, she is quite capable of attending to any adjustments which might be required on her car. She has recently testified to the admirable qualities of H.V. lubricating oil and greases, which are used at the above garage.

INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

A GENERAL meeting of the members of the London branch of the Graduates' Section of this Institution will be held at 1, Albemarle Street, Piccadilly, W., on Tuesday next, when Mr. C. F. T. House will read a paper on "Horse Power and its Estimation." Mr. J. S. Critchley will preside.

At the inaugural meeting of the Birmingham centre more than 100 pupils and apprentices were present.

At the last meeting of the Council there were present:—Dr. H. S. Hele-Shaw (in the chair), Messrs. Mervyn O'Gorman, F. C. A. Coventry, Charles Wheeler, Charles Marston, L. A. Legros, T. B. Browne, D. J. Smith, F. L. Martineau, J. S. Critchley, and Kees Jeffreys (secretary).

The following have been elected members of the Institution:—Messrs. J. W. H. Gill (Ceylon), R. W. Harvey-Bailey (Preston), E. G. E. Beaumont (London), L. Bell (Peebles), C. W. Hacking (London), E. A. Rainer (Pewich), C. E. Simms (Birmingham), F. Strickland (Malton), F. W. Hudlass (London).

New associate members include Messrs. S. de Beer (London), J. A. Doring (Coventry), J. C. Jolly (Coventry), S. H. Peppin (London), J. T. Taylor (Sevenoaks).

FORTHCOMING EVENTS.

JANUARY.

- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
 23rd (S.).—Annual Dinner of the Coventry Motor Club at the Craven Arms Hotel, Coventry.
 Annual Dinner of the Lancashire A.C. at the Park Hotel, Preston.
 26th (T.).—Scottish Motor Trade Association Dinner at Edinburgh.
 30th (S.).—Annual Dinner of the Auto-Cycle Club.

FEBRUARY.

- 2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.S.H. Prince Francis of Teck will be among the guests of the club.
 4th (Th.).—Annual Dinner of the Southern Motor Club.
 19th-27th.—Manchester Motor Show at Belle Vue.
 17th (W.).—Paper on Lubrication by Mr. J. W. G. Brooker at the R.A.C.
 20th (S.).—First Annual Dinner of the Sutton Coldfield A.C. at the Royal Hotel, Sutton Coldfield.
 24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
 Motor-Car Show at Barcelona.
 Last day for entries for Monaco Aeroplane Competition.
 6th (S.).—Cambridge University Motor-Cycle Club Reliability and Petrol Consumption Trial.
 20th-27th.—Cordingley's 14th Annual Motor-Car Exhibition and Market, Agricultural Hall, London.

MAY.

- 2nd (S.).—Targa Florio, Sicily.
 14th (F.).—British Motor Boat Club meeting at Erith.
 24th-29th.—Irish Reliability Trials—provisional date.

JUNE.

- 10th-18th.—Prince Henry Trophy Competition.
 14th (M.).—Commencement of the Scottish Reliability Trial.

JULY.

- 5th-10th.—Auto-Cycle Union's Six Days' Trial.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE Wimbledon Motor Cab Company, Ltd., has been registered with a capital of £5,000 and offices at 29, High Street, Wimbledon.
 VALVELESS, LTD., is the title of a company which has been registered with a capital of £5,000 and offices at 7, Upper St. Martin's Lane, London, W.C.

SYNDICAT FRANCAIS DES BREVETS E. M. BOWDEN, LTD.—At the seventh annual meeting of this company, to be held on Tuesday next, the directors' report will show a profit of £4,264 for the year, which, with the balance brought forward from the last account, will give a total of £5,754 available for distribution. From this a dividend at the rate of 20 per cent. per annum will be declared, £1,500 placed to general reserve, £852 carried to the next account, £188 provided as directors' extra remuneration and £313 written off the expenses of the new issue.

A. VEDRINE AND CO.—The accounts for the year ended September 30th show a net profit of £2,364, and, after reserving £6,500 in respect of doubtful debts, the credit balance of £4,370 brought forward was reduced to £235. For the previous period of seventeen months the preferred dividend was paid and 5 per cent. on the ordinary shares.

THE STORAGE OF PETROL.

AT Westminster, Walter James Meager (Meager and Adams), of a motor garage in Glendower Place, South Kensington, was summoned for a breach of the conditions of licensing for the keeping of petrol. Mr. Greenwood, prosecuting for the L.C.C., said that in view of the accidents which had occurred the Home Office regulations as to the storage of petrol spirit were very stringent. Under particular restrictions as to ventilation and storage the defendant was allowed to keep 200 gallons of petrol. An inspector found on the premises 160 gallons in excess of the quantity allowed, some of it being outside on the pavement. The defendant said that on that day they had a number of heavy orders to execute. It was usual to deliver the petrol in such cases direct from the trucks outside the shop, but on this occasion accidental circumstances prevented this from being done. Mr. Horace Smith imposed a fine of £10 and two guineas costs.

"DEWAR" CHALLENGE TROPHY.

THIS trophy, which was kindly presented to the R.A.C. in 1906 by Sir Thomas Dewar, M.P., is awarded for the most meritorious trial held during the year under the Long Distance Trial Regulations of the R.A.C. It has been unanimously agreed, after careful consideration of the performances made in such trials during 1908, that the trophy shall be awarded to Messrs. the Anglo-American Motor Car Company, Ltd., for their standardisation test of three 10-h.p. Cadillac cars, carried out on February 29th, 1908.

The 22-h.p. "Valveless" car entered by Messrs. "Valveless," Ltd., for a 1,000 miles trial was given the second place and was specially commended.

AUTOMOBILE ACCIDENTS.

AT an inquest held at Ilford concerning the death of a man who was knocked down and killed in the High Road, Ilford, the jury returned a verdict of "Accidental death." The coroner in his summing up said he did not think any blame could attach to the driver, but it was unfortunate that he should have swerved—as had been stated by his solicitor, in order to avoid deceased.

WHILE a motor-car in which Lieutenant George L. Browne and Lieutenant P. D. Campbell, of H.M.S. Ganges, were being driven from Shotley Naval Barracks to Ipswich, was passing over a level crossing close to the town it collided with a goods train. The train, which was being shunted, was going very slowly, but the motor-car was moving at a good pace. Lieutenant Campbell was thrown out violently against one of the trucks, but fell clear of the line and escaped with some bruises. Lieutenant Browne and Mr. H. C. B. Peck, who was driving, remained in the car and were unhurt. The front of the car was much damaged.

AT the Westminster Court on Monday, the coroner held an enquiry with reference to the death of an errand boy who was run over and killed by a motor-bus in Whitehall on the previous Thursday. The boy was riding a bicycle and fell under the vehicle from his machine in trying to avoid a collision with a motor-cab that cut right across in front of him. The jury returned a verdict of "Manslaughter by an unknown cab driver" and exonerated the driver of the bus from blame.

"POLICE CONTROLS."

THE police trap in the Eltham Road, Eltham, has been in frequent operation of late.

THERE is a measured quarter of a mile in the vicinity of Dunbarton. THE measured furlong in the Shooter's Hill Road has been in frequent operation of late.

BUSINESS NEWS.

THE Motor Schools, Ltd., have issued a neat pamphlet of Motor Notes which will be of service to their pupils.

WOULD-BE car purchasers will be greatly interested in the guarantee recently issued by the Junior and O.T.A.V. Cars Company, Ltd., of Long Acre, W.C. This guarantee is issued with every car purchased from the company, and practically covers the whole cost of upkeep with the exception of petrol, lubricating oil, and insurance for one year or for a distance of 5,000 miles. Such important matters as tyres, adjustments, replacements, and repairs are all covered, and every detailed form of inspection and rectification that the car is likely to require under fair usage for the time and distance named. At the end of the first year the purchaser has the option of renewing the guarantee by paying the Junior Company a moderate fee, and is thus enabled to run his car on the most economical lines and yet feel that his vehicle is at all times in thorough road-worthy condition. A noteworthy feature of the guarantee is that the Junior Company undertake to send a qualified mechanic, free of all cost to the car owner, to any part of the British Isles, in order to carry out such adjustments and repairs as may be required.

LADY EDWARD SPENCER CHURCHILL speaks in the highest terms of her 15-20-h.p. Coventry-Humber landaulet, which is now nearly two years old. Writing from Queensmead, Windsor, Lady Edward states that the car has just taken her, Lord Edward, a maid, a valet and a chauffeur, the luggage in boxes fitted on the top and on the carrier behind, also guns, cartridges, bags, &c., over the most severe hills in Shropshire and Herefordshire. Some of the cross country roads were in a deplorable state, but, in spite of all, the vehicle ran without a stop and took the hills without a falter.

IT may not, perhaps, be generally known that it is now possible to buy an aeroplane in London much as one purchases a motor-car, including in a similar way the option of several different makes, of varying horse-powers and different carrying capacities. Yet such is the case, and the whole transaction may be carried out within a mile of Charing Cross, and provision made for the entire supervision of the necessary testing before delivery. The firm who have taken the matter up is Messrs. Markham and Prance, 143, Strand, W.C., a firm which has for some time been well known in connection with land and marine motor matters, and which has now made all arrangements to meet the wishes of those who would desire to take up the aeronautical side of automobilism.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, JANUARY 30, 1909.

[No. 517.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

OUR PRIZE STORY.

WE recently offered a Prize of Two Guineas for the best Short Story in which the motoring interest was strong. After most careful perusal of the many MSS. submitted, we have decided to make the award to

MR. T. CRAVEN JOHNSON,
125, Walton Street, Oxford,

for his Story, "The Comet of Puddlehampton." A cheque for the amount of the Prize is being forwarded to Mr. Johnson.

Several of the Stories submitted were of considerable merit, and some—for which the authors will receive payment at our usual rate—will appear in the *M.C.J.* after the publication of "The Comet of Puddlehampton."

COMMENTS.

ONE of the innovations by which Major Lindsay Lloyd will seek to popularise the Brooklands Track during the coming season is concerned with the provision of a test hill up which members may be able to drive their cars in order to ascertain what they are really capable of doing. Now that road trials of an official character are a thing of the past, and those which may possibly take place in an unauthorised way are not regarded with favour by motorists or the public generally, the

provision of such an opportunity for gauging the speed of vehicles as is afforded by Brooklands becomes a real necessity. We understand that the hill which has been devised in the members' enclosure of the track makes an ascent of 60 ft. in a length of 275 ft., the average gradient being one in six. There is a stiff bit of one in three, this being near the top. No charge will be made to members of the Brooklands Club for the use of this test hill, and this opportunity of judging the powers and capabilities of their vehicles will doubtless be of interest to many automobilists who otherwise would have no chance of such knowledge. While the sporting side of automobilism will of course appear largely in the Brooklands programme, the serious work of testing vehicles both for manufacturers and private owners will give the place an element of success which has previously been wanting.

The Police View of the Bradford Case.

LAST week we gave the views of some leading motorists and tramway managers with regard to the Bradford case, which has secured a legal decision at variance with the safe practice universally adopted. Now we are able to emphasize the views generally expressed by giving the opinions of some representative Chief Constables, who agree that to pass a tram-car on the right-hand side is a foolish, if not a dangerous proceeding. Practically Bradford stands alone in this matter. In that city the legal position will be maintained by the police authorities. Surely it should be made the opportunity for a protest by local motorists, who should have the support of the Yorkshire A.C., and the bodies associated with that sportsmen's organisation, in showing the citizens of Bradford the lack of wisdom displayed by their rulers in adhering

to a law which has been condemned even by the men who have had to declare its meaning.

Fewer Offences, Larger Fines.

STATISTICS prepared by the Chief Constable of Cheshire on the subject of offences under the Motor Car Act were presented at a meeting of the Standing Joint (Police) Committee at Chester on Saturday. From these it appeared that,

although the total number of prosecutions in 1908 was 248, compared with 275 in 1907, the fines had amounted to £350, against £337 in 1907. Mr. J. J. Evans (Bebington) said the decrease in the number of prosecutions showed that drivers must be more careful, as there were in all probability more motor-cars on the roads. Prosecutions against drivers for exceeding the speed limit had fallen from sixty-eight in 1907 to twenty-four in 1908. On the other hand, magistrates appeared to have been more strict, and it was probably in the public interest.

The Scottish Motor Show.

THE twelfth annual Exhibition of the Scottish Motor Trade Association, which has been held during the past week at Edinburgh, is proof of the interest that is maintained in such displays. It was opened by Sir J. H. A. Macdonald, who, as chairman of the Scottish A.C., has done much to further the motor interests north of the Tweed. He rightly pointed out that one of the most notable features demonstrated by the exhibition was the favour with which coachbuilders regarded the motor industry, not only in supplying bodies for motors but also in becoming agents for motor-cars themselves. The Lord Provost, the Right Honourable J. P. Gibson, was in the chair at the opening ceremony, and Mr. Thomas Shaw, of Dundee, the President of the Scottish Motor Trade Association, voiced the thanks of those present for the interest which both he and Sir John Macdonald had shown in the enterprise.

The Irish Trial.

MANY members of the trade have most pleasant recollections of the Irish Reliability trials which have taken place during the last few years. Those for 1909 have now been definitely fixed to commence on May 26th, concluding on June 1st. On the first day the run will be from Dublin to Portrush; on the 27th from Portrush to Sligo, a speed trial being included on Magilligan Strand. The trip from Sligo to Galway on the next day will comprise a run through Connemara, this being succeeded by the journey to Killarney. After a rest on the Sunday the trial will be resumed from the lakes to the city of Cork. Then on June 1st the way will be made back to the Irish capital. On the last day a hill climb will be arranged and the petrol consumption will also be taken.

Horses v. Motors.

WE are now able to arrive at some accurate conclusions with regard to the comparative number of motor-cars and horse-drawn vehicles on the road. These are reached through the Inland Revenue returns. Until 1903 they showed a steady increase so far as the latter class of carriages were concerned, the totals in the year being 49,321 and 70,644, on which

two guineas and one guinea respectively had been paid as licence duty. There has been a steady fall in both categories since then until the returns for 1907, only recently available, show 40,254 for the two guinea and 62,343 for the one guinea class. Those vehicles on which the fifteen shillings duty is demanded were 326,029 in 1903 and 334,957 in 1907; but as motor-cycles, being two-wheeled vehicles, have been included in the latter classification, it is evident that this section of horse-drawn traffic is also on the down grade. On the other hand, the Inland Revenue returns relating to motor-cars show that the figures in the two guinea class have doubled, and those in the four guinea division multiplied eighteen times until they reached the large totals recorded in a recent issue. These figures have value in confirming what every motorist knows, *viz.*, that he practises a system of locomotion that will ease the horse of the burdens that have been his since the days when Hera the goddess queen went her way to harness the gold-fronted steeds and "Hebe put to the car the curved wheels of bronze, eight-spoked, upon their axle-tree of iron." Apart from the conclusions arrived at in connection with the Inland Revenue returns are the statistics of the Board of Agriculture, which show that the number of horses in the United Kingdom decreased by 12,312 in the last twelvemonth.

The Run of the Women's Motoring Club from New York to Philadelphia and back.
Fourteen cars entered for the contest but only nine actually competed, all being driven by ladies.

Clothing for Aeronauts.

THE standard lines of motoring garments having now been fully established, our sartorial contemporary the "Tailor and Cutter" is considerably exercised with regard to the clothing of those who go up in the air by ships, planes and balloons. We understand it is about to offer prizes for the best design or description of a costume suitable for wear when aero-planing or ballooning, and in sport generally above the clouds. The old terms that have been used in engine construction occur in the conditions; originality of idea; accessibility of fastening devices; practicability as regards cut, make and materials; adaptability as a life saver in case of mishap; reliability under all atmospheric conditions, and general durability are points that inventors and designers should bear in mind when preparing for the competition.

The British Army Experiments.

IN our Aeronautical Notes we have recorded, from time to time, the adventures that have befallen the efforts of the War Office to secure a flying machine. The whole history, so far, has been a series of mishaps followed by assurances of official confidence and the raising of the sanguine hopes of the experimenters. It would be interesting to ascertain the expenditure that has been incurred since September, 1906, when a war

kite went up from Chichester and let its passenger down among the trees at Goodwood Park. The subsequent series of optimistic starts and sudden stops is well known. Without seeking to discourage those who are striving towards success in Hampshire, we would, however, suggest that they have lessons to learn from the Englishmen, Frenchmen and Americans who are actually flying in France. Mr. Moore-Brabazon has been longer in the air than any of the Army men at Aldershot—and if accounts could be compared, his successful flights would be found less costly than have been the rather lame performances under the ægis of the British military authorities.

Signals for Deaf Cyclists.

ON many occasions the suggestion has been made that those cyclists who are unfortunately deaf should make the fact known to other users of the road by means of some distinctive badge or sign. The matter has now received careful consideration from the Royal A.C., the line of discussion being a proposition that deaf cyclists should be able to obtain "safety" discs for attachment to their machines, in order that motorists and others overtaking them may drive on such occasions with more than ordinary caution. Such discs would of course only be supplied after careful enquiry. A letter from the patentee was read at the last meeting of the committee, which approved of the idea in principle and referred the question to the Touring Committee. A suggestion was made that the discs should be numbered as a further precaution against improper use, and it would appear that a practical realisation of the notion is now in view.

Times and Trades Change.

NOW that there are nearly 200,000 automobiles of various kinds in the United Kingdom there is no reason for surprise at the changing character of the industries in many places. Some of the Midland towns have felt the alteration in the nature of demand very considerably, and complaint is pretty general that the country saddler is having a difficult task to act up to old-time prosperity. The trade decline with regard to saddlery is shown very conspicuously in the present position of the staple trade of Walsall, although another branch of industry in the town—malleable ironfounding—has been improved by the advent of the motor. The lethargy of the saddler in trying to adapt himself to the new condition of things will leave him in a condition of business isolation ere long—indications of troublous times for that industry have been fairly frequent of late in the lists of financial embarrassments.

Manual for Engineers.

ONE of the latest publications of Messrs. C. Griffin and Co., Ltd., is that on "Oil Motors, their Development, Construction and Management"—a handbook for engineers, owners, and all interested in engines using liquid fuel. This is a translation of a volume by G. Lieckfeld, which is recognised as a standard work on the subject in Germany, and has more than 300 illustrations scattered over nearly that number of pages. After a preliminary dissertation on liquid fuels as a means of power production the author goes on to treat of the development of petrol and paraffin motors. Here we are reminded that seventy years ago William Barnett took out an English patent for a gas engine worked with some easily volatilised hydro-carbon. Acknowledgment is made of the first engine worked direct with petrol, which was that built in 1873 by Hock, of Vienna. This, however, was never regarded as much more than an experimental engine, although it contained a number of original features. For the first time use was made of the open-ended cylinder of the trunk piston and the direct drive on to the crank. Then came the Brayton engine and the invention of the four-stroke cylinder compression engine by N. A. Otto. With considerable detail, illustrated by many drawings, the author traces the subsequent development of petrol and paraffin motors,

together with their construction and component parts. A useful chapter is that on ignition devices, while one of the most practical is that on the correction of irregularities in running. The history of automobile engines, and also of road and rail vehicles and airships, is carefully written, the latter section being brought as far as the Zeppelin and "Ville de Paris" dirigible airships. In this section history is still being made. The volume is a good addition to the literature of automobilism, and should have great interest to all who have been technically concerned with the development of the motor-car.

Sheep on the Highway.

A MEETING of the Cumberland and Westmorland farmers has been held at Penrith to protest against a proposal that is being made to the councils of those two counties by owners of automobiles, to the effect that sheep which are being driven along the highway at night should be preceded and followed by a light. Several speeches of protest were made and it was apparently thought that the many years sheep have been known to spread themselves out over the whole of the roadway

for the Bromley Rural District Council, and at the last meeting a letter was read from Mr. Granville Kenyon in which he added, "I take it, of course, that the Council will maintain the boards after erection." The Chairman, Sir H. A. Lennard, Bart., referring to this, said the reference put a different complexion on the matter. The letter was thereupon referred to the Farnborough Parish Council. We hope that wise counsel will prevail and that both bodies will recognise that they have a public duty to perform in encouraging those who possess sufficient local patriotism to do the work that the authorities have neglected to perform.

Unrolled Metal for Motorists.

ALTHOUGH the responsible newspaper correspondents often make ridiculous suggestions with regard to thwarting the progress of automobile matters, it is not often that persons who are elected to public bodies actually go so far as to move such resolutions as that which Mr. R. S. McCaig raised at the last meeting of the Rhins District Committee, held at Stranraer. This was to the effect that the district committee should "instruct their road surveyor to put down road metal (unrolled),

Mr. and Mrs. Alfred Wynne Corrie, of Park Hall, Oswestry, and their two Daimler Cars, which are used to the fullest extent on the excellent Shropshire roads.

constitutes a precedent which should not be departed from, whatever additions are introduced into the traffic of the highway. Although the meeting was obviously one of protest against the proposals of motorists, it quickly resolved itself into an aggressive attitude and ultimately passed a resolution suggesting that the County Councils of Westmorland and Cumberland should apply for a speed limit of ten miles an hour. This proposal was adopted unanimously and is now being referred to the Councils concerned.

The Erection of Warning Notices.

THROUGHOUT the country the various automobile clubs have done good work in providing notices and warning boards for erection at dangerous corners, cross roads, and other places. As a rule the local authorities have recognised in this enterprise economy for the ratepayers, and when the clubs have borne the first cost have rightly accepted the responsibility of maintenance. Apparently, however, in some parts of Kent a different line is being taken. We would suggest that the authorities who decline to maintain the boards are really neglecting their duties to the public. The Kent A.C., for example, is providing warning boards

on the roads at dangerous places to compel motorists to drive at a more reasonable pace." In the course of his speech he referred to the police traps which had been established at considerable expense and also to the dust nuisance, concluding by explaining that the surveyor should put down this rough metal where the speed was apt to be exceeded in order to moderate the pace of motorists in the district. The motion was seconded, but on a vote being taken was lost, only five members supporting while eight were against. The Earl of Stair presided, and the discussion, which was undertaken in a very serious spirit, would serve to remind readers in Scotland that there are still a large number of members of the local authorities inclined to regard the motor-car with something like aversion.

THE British Xylonite Company, Ltd., of Hale End, London whose City showrooms are at 3, Fore Street, E.C., are specialising on transparent accumulator cases in xylonite (celluloid) for the trade. They have brought out some excellent types of corrugated separators in sheets or pieces, and are well able to carry out special work for makers of accumulators, &c.

A Visit to an Aeroplane Factory.

THERE can be no question that the year that has recently closed will mark an epoch in the aeronautical world, and particularly that portion of it related to the aeroplane or heavier-than-air form of flying machine in contradistinction to the airship or dirigible balloon type. The successful flight of one kilometre accomplished by Mr. Henry Farman in the first month of 1908 gave the necessary impetus to the movement, since when progress has been so rapid that at the time of writing the record flight, to the credit of Mr. Wilbur Wright, stands at 77½ miles in 2 hr. 20 min. 23 sec. In addition to Wright and Farman there are many others at work in the development of the flying machine, among them being Messrs. Delagrangé, Bleriot, Santos Dumont, Levavasseur, Esnault-Pelterie, Welferinger and Mr. J. T. C. Moore-Brabazon. Apart from these now well-known names there is a very large number of enthusiasts quietly engaged in experiments, and according to one authority there are at the present moment not less than 350 aeroplanes of various designs in course of construction in different parts of France, many of which are being built with the view of competing for the thousand and one prizes that are offered to aviators.

When in Paris on the occasion of the recent Salon an opportunity was afforded me of visiting the works which have recently been established at Billancourt for the construction of aeroplanes by Messrs. Voisin Freres, two enthusiastic students of aeronautics who have been experimenting with aeroplanes since 1903. The works, which are situated on the bank of the Seine, nearly opposite to the exercising ground of Issy-les-Moulineaux, where so many experiments in aviation are carried out, comprise an extensive erecting shop, a machine shop, where the fitting up and adjustment of the mechanical portion of the apparatus is undertaken, and an experimental department, where trials are made with the bearing or sustaining surfaces of the machines and where the motors are tested. The machine shop calls for no special remark beyond that in it are produced the propellers and other metal portions of the aeroplanes, the firm having to turn out these themselves, for, as my guide remarked, there are as yet few, if any, firms making a speciality of catering for the demands of aeroplane builders.

In the experimental shop, in addition to a special bench, on which engines intended for aeroplanes are carefully tested, there is an interesting piece of apparatus which may be termed an artificial wind maker, intended for the testing of various types of bearing or supporting planes.

Quite half-a-dozen aeroplanes were in various stages of construction at the time of my visit, among them being a tri-plane for Prince Bolotoff, with which he intends to make an attempt to fly across the English Channel; it is to be fitted with a Panhard 100-h.p. engine and is designed to carry three persons. In one corner of the shop stood a somewhat novel machine known as the "Flying Fish," built for Henry Farman, work, however, on which has been suspended until a suitable motor is obtained. Instead of having double planes, the new machine has, on either side, three wing-like single planes, giving it the appearance which has suggested its name. The body, made of ash, has, indeed, the exact shape of a long and slender fish, tapering backwards with a gentle drooping

curve. It is 46 ft. long, square in section, and comes somewhat sharply to a point in front, where an aluminium plate supports the shaft of the propeller. The four members are connected by wooden ties and steel stays, producing a girder of great rigidity. The machine is mounted on two wheels placed well forward under the motor platform. The steel framework which carries these wheels, as well as that of a third wheel placed near the tail, is provided with strong spiral springs intended to reduce the shock when alighting on the ground. The six rectangular "wings" are fixed towards the head of the machine, and are each 8 ft. 8 in. long and 1 ft. 3½ in. wide; they consist of wooden frames rising towards the extremity, slightly curved and tapering on the same lines as the body of the "fish" itself. They are covered by a double layer of thin fabric. The second plane on each side is placed somewhat lower than the first and the third slightly lower than the second. At the tail are two similar but rather shorter planes, the hindmost of which is movable on its axis, and acts as a horizontal rudder for regulating the height of flight. At the end of all comes the vertical cellular steering rudder. The whole body is covered with light textile material, but in front of the pilot's position sheets of mica are fitted in order that his view may not be obstructed. The total bearing surface is 24 square metres. A novelty has been introduced into the steering apparatus; the wheel, which resembles that of a motor-car, is mounted vertically and acts normally upon the vertical rudder, but when moved horizontally it acts by means of a lever on the horizontal rudder.

Messrs. Voisin are not advocates of high-flying, nor as yet of aeroplanes flying over towns; they believe that, for the present at least, it is desirable to fly at a reasonable height and in the open country only, the machine coming to earth when it is necessary to pass through a town, and with this in view are designing an aeroplane the overall width of which will be such as to enable it to be taken through the streets without difficulty. The firm

have now standardised their designs, and are so confident of the ability of their productions to fly that they are prepared to guarantee that the owner shall make a flight of from one to two kilometres before definitely taking over the machine. Incidentally it may be mentioned that the cost of a modern aeroplane is £800.

The firm are open to build flying machines of any design; what may be termed their standard pattern is a bi-plane somewhat similar to the Farman and Delagrangé machines. To briefly describe the apparatus, it may be stated to comprise a lengthy, spindle-shaped body, to which wings or supporting planes are applied, while in addition it serves for the support of the engine, the propeller, and the aviator. It has also attached to it the metal framework on springs which serves for the attachment of the cycle wheels used for propelling the aeroplane along the ground to enable it to attain the necessary speed to lift itself into the air. The steering apparatus is placed at the front end, and at the rear are the arrangements for imparting stability to the machine. The planes are composed of surfaces of light waterproof material stretched on frames of poplar, united by uprights of the same wood. The Farman machine is 42½ ft. long, 39½ ft. over all width, and 5 ft. 10 in. high: its total bearing surface is 60 metres, while the weight, including the 50-h.p. engine and the aviator, is 11 cwt.

C. J. W.

Mr. J. T. C. Moore-Brabazon's Aeroplane, built by Messrs. Voisin Freres.

GOSSIP FROM PARIS.

A Breeze in the French Motor Industry.

The French Chambre Syndicale de l'Industrie Automobile is getting into hot water. An official notice sent to the Press last week said:—"All persons wishing to purchase automobiles for touring or industry can apply to the Chambre Syndicale de l'Industrie Automobile, Place de la Concorde, Paris, which will indicate to them the manufacturers most capable of furnishing the required cars." A great many motor-car makers do not like this, and contend that was not the object for which the Chamber was created. The agents and intermediaries who have from the first worked so hard, it is true in their own interest, but simultaneously in the interest of the automobile industry, also read with surprise that the Chamber was seeking to substitute itself for them. M. Sapène, managing director of the Motobloc Company, in a letter on this subject addressed to the editor of "Les Sports," said he did not wish to throw suspicion on anyone, but he declared: "It is probable that even among the manufacturers forming part of the Chamber there will be great uneasiness concerning the distribution of the demands received. Will not those demands flow towards specially favoured firms?" He concluded by suggesting a general consultation of manufacturers and intermediaries on the question as to whether the Chamber should occupy itself with the sale of cars. M. Sapène's letter has had the good effect of provoking a reply from M. Bazin, the Secretary of the Chamber. He points out that the first portion of the incriminated notice calls the attention of all its members to a demand it had received for twenty-five cars, and declares the concluding portion of the circular notice should be read to mean that the Chamber would continue to act in the same way with all the applications it should receive. I cannot say this explanation has entirely satisfied all the interested parties, because the promise made in the official notice "to indicate to them (the buyers) the manufacturers most capable of furnishing the required cars" was very explicit, and scarcely in accord with M. Bazin's subsequent declaration.

An Aeroplane Fete at Angers.

The committee formed at Angers for the Grand Prix is determined not to be completely balked. When the A.C.F. refused to organise the great international race the Angers committee announced that it would dispense with the assistance of the club, and hold the automobile competition on the Anjou circuit, so to say, in spite of the official authority. It is probable its members, though influential men in the department of the Maine-et-Loire, were not equal to the task. At any rate, they abandoned it, and perhaps wisely. What was to be done to make up for the loss of their long-cherished hope? At a meeting held at Angers, under the presidency of Doctor Monprofit, the Mayor of the town, it was unanimously agreed to substitute a great aeronautic and aviation competition for the defunct automobile Grand Prix. The epoch chosen is the second fortnight in September next. The programme of the fêtes comprises a challenge cup for an aeroplane flight from Saumur to Angers, various other competitions for machines heavier than air, a steerable balloon race, and a competition for ordinary spherical balloons. The Municipal Council of Angers is to be asked to transfer its subsidy of 25,000 francs from the Anjou Circuit fund to the organising committee of the projected fêtes, and all the other contributors to the Grand Prix fund will be requested to follow the example. By that means it is believed the new committee, which is virtually the same as the old one, will have quite enough money to offer the rich prizes necessary to tempt aeronauts and aviators. It is possible the venture will be more successful than that of the Grand Prix, especially as it is said there is in the neighbourhood of Angers a large expanse of meadow land suitable for aeroplane experiments.

The Progress of the Aeroplane.

Wilbur and Orville Wright, accompanied by their sister, have been entertained royally by the Pau authorities. The two

aviators richly deserve all the honour which can be paid them, for it is certain that not only did they invent the first practical flying machine, and also constructed the first reliable light motor, which none of the French makers has yet been able to equal, but Wilbur Wright by his performances at Les Hunandières Racecourse, and at Auvours Camp, near Le Mans, gave such an impetus to the movement that no one now doubts the era of aerial locomotion is at hand. It may be that Wilbur Wright would not have revealed his mastership of the air so promptly if Henry Farman had not made his circular flight of a kilometre (five-eighths of a mile) at Issy-les-Moulineaux on January 13th, 1908. But even the English aviator said to me last week: "Most surely we should not be where we are to-day if Wilbur Wright had not come to France. He has convinced the most sceptical, and, what is more, he has fired the French aviators with the ambition to excel him. That is a great thing. His aeroplane has qualities and defects, as my old machine had. Neither his nor my machine, nor any of the existing aeroplanes, can be called the definitive type of flying machines, and it still remains to be seen whether it will be Wright or some other aviator, perhaps still unknown to fame, who will be the first to create an aeroplane which can be safely put into the hands of the general public to be used for sporting and touring purposes before being employed for every-day work."

Some of the Motor-Buses in Service between Honfleur and Trouville, France.

A Proposed Chair of Aviation in France.

M. Archdeacon, the well-known patron of the French aviators, is strongly in favour of France following the example set by the German Minister of Education, who has appointed a learned professor to lecture on aeronautics at the Göttingen University. He considers that, as in the case of a science so young as aviation it is above all on the young rising generation its development must depend, it is useful and even necessary to teach the leading principles to prevent the youth of the land from losing their time in useless trials to prove the truth of ideas which their predecessors have by experience shown to be false. M. Archdeacon has already spoken to the Minister of Public Instruction about the advantages of creating a professorship of aviation at the Collège de France, and has found him most favourably disposed towards the idea. But here the red tape steps in. The project cannot be realised to-morrow. The Minister is not all-powerful. Such a matter as the creation of a professorship depends exclusively on the Superior Council of Public Instruction. Then, supposing the principle of the aviation professorship adopted by that Council, the Chamber and Senate would have to vote the professor's salary, unless it should be secured by a private donation. It is therefore pretty clear M. Archdeacon will have enough to do for some little while to secure the prompt adoption of his idea, especially as he wishes also to create in Paris a laboratory of aero-dynamics destined to furnish aviators with the necessary elements for the construction of aeroplanes.

MARNBY.

A NOVEL FOUR-CYLINDER ENGINE.

WE illustrate herewith an extremely novel design of four-cylinder engine which has just been put on the market by La Société des Automobiles Aries, of Villeneuve-la-Garenne, Paris. A first glance at Figs. 3 and 4 would give the impression that the engine is just an ordinary one

Figs. 1 and 2.—Sectional Elevations of Aries novel Four-Cylinder Engine.

A.—Big end of connecting rod of piston E.
B.—Crank-pin.
C.—Crank-pin.
II' and J.—Crank discs.
KK'—Crank-shaft.
LM.—Half-time gear wheels.
N.—Magneto driving pinion.
O.—Magneto.
P.—Lubricating oil inlet.
QQ'—Cams.
e.—Depression in pistons.

of the two-cylinder type; closer inspection, however, will show that the company have struck out in an entirely new direction, and have produced an engine which, within usual dimensions, comprises not two but four cylinders. The only difference from the customary pattern is that the head is somewhat larger than

Figs. 3 and 4.—Front and side views of the Aries novel Four-Cylinder Engine.

E F H.—Three of the four cylinders, the fourth one G is invisible, being behind F.
K.—Crank-shaft.
PP'—Lubricating pipes.

S.—Platform for magneto.
U.—Outlet for water from jackets.
V.—Inlet port.

usual, and that it contains eight valve covers. By examining the line drawings Figs. 1 and 2, it will be seen how the four cylinders are somewhat originally arranged, there being two sets of pairs of cylinders set in the form of a sharp V, the connecting rod of each piston of the pairs of V-shaped cylinders being connected to the same crank pin. The crank shaft is of the built-up

type, and has two throws set at 180 deg. one to the other, the crank webs taking the form of discs I I' J (Fig. 2).

As the connecting rods of the cylinders E F work on the same crank pin, the outer ends of the pistons would dash into one another were special provision not made to prevent this; at one portion of the outer surface of the piston, where it has the least pressure on the wall of the cylinder, a depression e (Fig. 2) is formed. It will be noticed that the depression also appears on the piston of the cylinder E; in this case it serves no useful purpose, and is only employed on the grounds that the makers prefer to use the standardised form of piston.

The big end of the connecting rod A is of the forked type, while that of B is of the ordinary pattern. While the valves, inlet and exhaust, for each cylinder are located on one side, those for the left-hand cylinders are naturally on that side of the motor, and those for the right-hand cylinders are on their respective side, two cam shafts being thus, of course, required. The engine is said to be perfectly balanced, and to have given very satisfactory results on the test bench; the object of its introduction has been to supply a four-cylinder engine which can be substituted for single and double cylinder engines in old vehicles with but little difficulty. We are indebted to our French contemporary "l'Omnia" for the illustrations.

SOME REMARKS ON TYRES.

It is astonishing what widely varying experiences motorists have with regard to tyres. Some can run thousands of miles without experiencing any trouble, while others may only go a few hundred miles ere punctures, bursts and other tyre worries are encountered. We have heard of several cases lately where motor-car owners have complained of excessive wear of outer covers of the front tyres. Although the blame has been laid at the door of the manufacturers, we are inclined to think that if the motorists in question would carefully examine their cars they would find that the front road wheels are not perfectly parallel. The least departure from parallelism causes a certain amount of sliding friction between the tyres and the road, with disastrous results to the former. In the correspondence columns of the *M.C.J.* recently Mr. A. Duckham raised a point in regard to the use of partially-worn tyres on the front wheels of motor-cars which is deserving of close attention. The bursting of a tyre is not a matter to be regarded lightly, and when it occurs on one of the steering wheels may be the cause of a serious accident owing to the driver temporarily losing control of the steering gear.

ELEVEN coil-manufacturing concerns in the United States have just formed the Allied Coil Manufacturers' Association, the object of which is to protect the legal rights of its members to manufacture, use and sell interchangeable unit spark coils. The association will defend any suit instigated against its members, or any of its customers, involving the basic principle of interchangeable unit coil construction.

CONSIDERABLE interest has been evinced by the announcement that Humber, Ltd., are about to place a new 16-h.p. model upon the market. The car has a greatly improved engine, being much more silent and flexible than any the company have hitherto turned out. The method of oiling is similar to that adopted for the new 8-h.p., and will be found relatively economical. The system is also very effective in preventing smoke from the exhaust, whilst it thoroughly lubricates every bearing and reciprocating part. At the same time, it also prevents the escape of any particle of oil, thus leaving the outside of the engine and parts perfectly clean. These are outstanding features which will appeal to motorists. The universal joints are of the "ring" design, which prevents any back lash. The gear-box and back axle are of the same pattern as on the 20-h.p.; the springs are three-quarter elliptic, and the utmost care has been taken to ascertain the exact strength of spring required, thus ensuring the acme of comfort. The tyres are 815 by 105 mm., which, it will be recognised, are of ample dimensions for a car of this size.

AERONAUTICAL NOTES.

It is proposed to establish an aeroplane trial ground at Avor, near Bourges, France.

A PARIS optician, who evidently means to be up to date, is making a speciality of goggles for aviators.

A COMPANY has just been formed in Paris (25, rue le Peletier) with a capital of £16,000 and the title La Société Générale d'Aéro-Locomotion.

It is announced that a French insurance company has already started to issue policies on the lives of aviators. The premiums are considered to be somewhat high.

New aeronautical clubs are springing up all over France; one entitled Le Sport d'Amiens has just been formed at Amiens, while at Orleans has just been established the Aero Club du Centre.

THE new Zeppelin airship now in course of construction at Friedrichshafen, Germany, will be completed in March. The balloon, which supports an aluminium hull, is divided into seventeen compartments or "ballonnets." There are two motors, each of 100-h.p. The length of the airship is 450 ft. and the diameter 42 ft., the cubic capacity being 15,000 metres.

THE Aero Club of France has received two new prizes, the first of which, £20, will be awarded to the maker of the French motor installed on the aeroplane which holds the record for flight on June 30th next. The other prize is one of £8, which will go to the maker of the engine of the machine which takes the second place.

SOME successful flights were last week made on the practising ground at Issy-les-Moulineaux, near Paris, by the Antoinette IV. aeroplane. Piloted by M. Welfringer a speed of forty-seven miles per hour was attained and some excellent turning demonstrations made. The machine also flew a distance of 500 metres, having a passenger on board in addition, thus creating a record for an apparatus of the monoplane type.

It is reported that aeronautics is to form part of the studies of the midshipmen at the U.S. Naval Academy at Annapolis. While serious thought is not being given to the subject by the naval authorities at present, the practical value of heavier-than-air machines is acknowledged by naval experts, and the fact that the U.S. Navy Department intends to acquire four flying machines of this type indicates that the question of aeronautics in its relation to naval strategy has been considered.

AN airship is at present being built for the Russian Government by Messrs. Lebaudy, at Moisson, France, where also a second steerable balloon, to be called the Liberté, and intended for the French Government, is in course of construction. The latter will be fitted with a Panhard 135-h.p. engine, while the one for Russia will be of the same size and model as the République, which was finished and sent to Verdun last year, but the motor will be of 90-h.p. instead of 80-h.p.

THE flat lands of Essex have naturally found favour with those who have been looking about the country for a suitable ground whereon to test the various aeronautical machines that are now being fashioned in this country. Stretching between the eastern suburbs of London and the little town of Grays, in Essex, are miles of dreary fields without an elevation and with only one or two villages of any size. Near Dagenham the Aeronautical Society has acquired some open ground which will prove an ideal testing place for inventors. Surrounding the site acquired is a flat open country with few trees and houses, while the advantages of the selection are increased by the presence of a piece of open water for service in connection with motor boating. This will also serve to keep the crowd away from the experimental grounds—an important consideration, judging from the experience of the experimenters at Le Mans, France. The site at Dagenham is reached from London in less than three-quarters of an hour.

THERE is some talk of establishing an aeroplane trial ground at Knocke, a growing Belgian seaside resort.

A LADIES' aeronautical club has just been founded in Paris. The club has been named the Stella, and under the rules each adherent must make at least one ascent a year.

M. VAN DEN BERGH has obtained permission from the Belgian Minister of War to use the military parade ground at Antwerp for experimental flights with an aeroplane he has invented and built.

THE Aero Club du Littoral is the name of a new association which has been formed at Ostend. It is considered that the beach at that popular seaside resort would at low tide form an excellent trial ground for aeroplanes.

It is announced that M. Léon Bollée is about to build an aeroplane. M. Bollée, who was one of the pioneers of the motor-car, has been intimately connected with Mr. Wilbur Wright during the latter's sojourn at Le Mans.

FOLLOWING the establishment of a Chair of Aeronautics at Göttingen University, the Charlottenburg Technical College has petitioned the Prussian Ministry of Education for funds for the establishment of a chair of Airship Construction to be attached to the Marine Engineering Faculty.

M. ANDRE FALIZE has increased the prize he has offered to the French Ligue Nationale Aérienne to £80; it will be awarded to the first aviator who succeeds in flying from the Invalides, Paris, round the Vendôme Column and the Arc de Triomphe back to the Place des Invalides.

IN addition to Messrs. Farman and Moore-Brabazon two other aviators have now taken up their quarters at Chalons-sur-Marne; they are M. L. Demanest and Capt. Burgeat. The former will make experiments with a monoplane of his own design, while the latter will make trial flights with an Antoinette monoplane.

MESSRS. VINOT AND DEGUINGAND, the makers of the well-known Vinot cars, have just completed a 50-h.p. petrol engine specially designed for aeronautical purposes; it comprises four vertical cylinders arranged in two pairs, with the valves on opposite sides. It is fitted with high tension magneto ignition and a separate exhaust pipe for each of the cylinders; the weight of the motor is given as 338 lbs.

SIR HIRAM S. MAXIM has written and Messrs. Whittaker and Co. have published a new volume on "Artificial and Natural Flight," which has current interest and permanent importance. The chapters deal with air currents and the flight of birds, the flying of kites, flying machines, aeroplanes and balloons, the letterpress

being elucidated with the help of nearly a hundred diagrams and illustrations. Reference is made to Sir Hiram's own experiments in 1889 before the petrol motor had been reduced to its present degree of efficiency and lightness, and when he was practically limited to the steam engine. How quickly events move in the aeronautical world is apparent from the air of dubiety with which the author regarded the flights of the Wright Bros. in America on p. 109 and then on p. 160 accepts the records they made in France. In fact, the history of the flying movement is comprehended within a very short space of time, although some of the principles now successfully adopted were originally advanced some years ago. Sir Hiram Maxim notes that "all flying machines that have met with any success have been made on the same lines; all have superposed aeroplanes, all have fore and aft horizontal rudders, and all are propelled with screws; in this respect they do not differ from the large machine that I," continues the author, "made at Baldwin's Park many years ago." Those who are following the present boom in the air will welcome this volume, which is written, it should be noted, with a freedom from technical terms that will secure its acceptance by the general public.

M. Ernest Archdeacon—a prominent supporter of the aeronautical movement in France.

[From a caricature sketch in the "Auto."]

Aeronautical Notes—continued.

LA SOCIÉTÉ FOREZIENNE D'AVIATION is the name of a new association which has just been formed at St. Etienne, France.

M. GUYOT, who on a Delage car proved the winner of the Grand Prix des Voiturettes last year, is proceeding to Pau in order to be initiated into the art of manœuvring a Wright aeroplane.

WE understand that Mr. Frederick Simms, of the Simms Manufacturing Company, Ltd., Welbeck Works, Kilburn, has acquired the exclusive British rights in Messrs. Voisin Freres' aeroplanes.

It has been decided by the Aero Club of France to introduce a new regulation in connection with the Michelin Cup for this year, it having resolved that it will not be awarded unless the distance of 77 miles traversed by Mr. Wilbur Wright when he won it last December is at least equalled. The flight has to be made on a closed circuit.

M. BLERIOU achieved a successful flight on his new single-plane flying machine at Issy-les-Moulineaux last week-end. He covered a distance of about 200 yds. at an estimated speed of forty-six miles an hour. This machine, which is fitted with a 25-h.p. engine, is notable for its small area of plane surface, the total being 110 sq. ft., as compared with the 500 sq. ft. spread of the Wright machine.

ON Saturday last Prince Henry of Prussia made a trip lasting over an hour in the Gross military motor airship. The

The Robert Aeroplane with which some trials are at present being carried out at Amiens, France.

weather was brilliant, but very cold. The airship ascended from the balloon quarters at 9.15 a.m., and headed for the centre of Berlin. After passing over Unter den Linden to the Royal Castle it returned to Tegel, following the route of the principal business thoroughfares to Charlottenburg.

THE Aero Club de France has formulated the regulations according to which certificates of proficiency, carrying the right to the use of the title "pilote-aviateur," will be granted to users of heavier-than-air machines. Candidates must make three complete circular flights, each of not less than a kilometre, without allowing the flying machine to touch the ground. The three flights must be made on different days, yet must be executed within a space of thirty days.

IN our club notes we give a summary of the lecture by M. Esnault-Pelterie before the Aero Club in London, on Tuesday. Our visitor was awarded the Cross of the Legion d'Honneur a fortnight ago for his services to aeronautics. He is singular among investigators with an engineering education in that he has never devoted himself to any branch that has not had a bearing on aerial locomotion. At Wissant, in 1904, he began gliding experiments to test the claims of the Wright Brothers, achieving practically identical results.

ALTHOUGH the Monaco aeroplane meeting was due to begin on Sunday last, none of the machines had arrived, and there is no immediate prospect of any of the entrants attempting the journey from Monaco Harbour to Cap Martin and back. According to the secretary of the International Sporting Club, M. Demanest, who

controls both the motor-boat meeting and the Concours d'Aviation, it is unlikely that any attempt to cover the course will be made before the second week in February at the earliest. Several large sheds have already been built to receive the aeroplanes of the competitors.

CAPTAIN VON WALACH HALLBORN delivered an interesting lecture at the Austrian Automobile Club in Vienna on Friday, last week, on his project for the construction of a steel airship. The gist of his project is that an airship built of steel and filled with gas would give far greater stability than is attainable with any dirigible balloon, and would, by reason of its impermeability, retain its gas for an indefinite length of time. A ship of 50 ft. diameter would need to be 500 ft. long. It would rise and fall by the operation of a device which Captain Hallborn has patented. The platform would be 328 ft. long, and would be attached to the steel body by a net of steel wire. Two propellers and two steering screws would be driven by three 150-h.p. petrol motors. The cost of construction would, it is claimed, be only a fraction of that of Count Zeppelin's aluminium airship.

"It is practically certain that we shall fly from Paris to London this year." This is the firm belief of M. Surcouf, who was responsible for the construction of the Clement-Bayard dirigible air-ship which is owned by M. A. Clement, a vice-chairman of Clement-Talbot, Ltd. M. Surcouf has expressed his surprise at the backwardness of Great Britain with regard to aerial navigation, and intimates that his firm is negotiating for the formation of an English company. If the negotiations are successfully carried out, a big fillip will certainly be given to the advancement of aerial flight in this country. It may be mentioned that the Société Astra, of which M. Surcouf is a director, are at present constructing a large aerial cruiser for the French Government, a high-speed cruiser for another customer, and between twenty-five and thirty aeroplanes, which certainly indicates plenty of activity in the new industry.

FOLLOWING the example of his brother Henry, Maurice Farman has had built an aeroplane with which he is about to make some trials at Buc. It is of the double plane pattern, the planes being 32 ft. over all length. The frame carrying the motor and the pilot is, as usual, in the centre. The steadying device consists of a single plane, which may be raised or lowered by a lever, and by a special arrangement will always remain in the position left by the pilot. The rudder for steering right and left is operated by an endless cable. The chief innovation is the arrangement by which the after part of the planes may be raised or lowered at will. The arrangement is such that when the after or rear part of the right plane is lowered, the corresponding part on the left side is automatically raised. The frame for the machinery rests on two strong bicycle wheels. Maurice Farman is at present trying two motors, one a R.E.P. 40-h.p. weighing 220 lbs. and a Renault which weighs 374 lbs., and has developed 58-h.p. at a trial. There is only one propeller with two blades $8\frac{1}{4}$ ft. in diameter, which will run at 800 revolutions per minute. The weight of the machine, without the motor, pilot and accessories, is about 5 cwt.

AN accident has occurred to the aeroplane built at the military balloon factory at Farnborough. In our issue of the 16th inst. we illustrated and described this machine. Between then and its trial on the 20th some alterations had been made, notably the transposition of the radiators from the rear to the centre of the aeroplane and the deflecting planes being fixed midway between and at either end of the superposed planes, thus giving an extra length of about eight or nine feet to the hull. At the trial the aeroplane was steered by Mr. S. F. Cody and rose about twenty feet. It had travelled about a hundred yards when the machine dipped, and the wheels lightly touched the earth. Rising again, however, the aeroplane continued its flight. At first the aeroplane rose to a height of between 20 ft. and 30 ft., but before a quarter of a mile had been covered this height had sunk to 10 ft. With the machine still heading for the balloon factory, the spectators stood awaiting a turn or halt, when suddenly the aeroplane dropped to earth, bounded up again about 10 ft., and then pitched face downwards to the ground. Fortunately Mr. Cody was not hurt and the damage was confined almost exclusively to the lifting plane and to the cycle wheels which support the chassis and engine.

CONTINENTAL NOTES.

The French Tax on Motor-Cars.

A little surprise is in store for all automobile owners in France. To avoid fine they should have already made the declaration to the fiscal authorities concerning the horse-power of their cars. January 15th was the last legal delay. When they receive the notice to pay the tax on them many will be disagreeably astonished to discover it is considerably in excess of the amount charged last year. The duty has not been increased, but the interpretation of the clause relating to the horse-power of the motor has been modified. The supplementary tax of five francs per horse-power was instituted before the manufacturers adopted the system of designating motors with two figures to protect themselves against prosecution by their customers. It had happened that purchasers of motor-cars were discontented when by chance the motor sold as a 10, 20, or 30-h.p. gave a trifle less power. Several makers were, consequently, sued and condemned to pay compensation. That is why they now call their motors, for instance, 10-12-h.p., 20-30-h.p., &c. Till this year the fiscal authorities contented themselves with charging the horse-power tax on the middle figure. A 10-12-h.p. car paid on 11-h.p., and a 20-30 h.p. car on 25-h.p. That satisfied everybody, but now M. Caillaux's instructions are to charge on the highest figure, that is to say, on the 12-h.p. for the 10-12-h.p. motor, on the 30-h.p. for the 20-30-h.p. engine, &c. This arrangement, which, it is calculated, will transfer from the pockets of motorists into the coffers of the State an extra contribution of some £20,000, naturally discontents both automobile manufacturers and their customers, who consider they were already too highly taxed. It is certainly not a good way to encourage a new industry.

A Taxi-cab Procession in Paris.

A novel demonstration was organised in Paris on Wednesday last week, by a large number of chauffeurs, in favour of one of their comrades, named Girard, who was recently condemned to three months' imprisonment for striking a police official. Girard has always protested his innocence, and the taxi-cab drivers of Paris are convinced that he was wrongfully condemned, consequently twenty-five motor-cabs assembled outside the Tuileries Gardens. Each was laden with members of the Chauffeurs' Union and exhibited a large yellow poster with the words "Affaire Girard! A judicial infamy! An innocent man condemned!" The manifestants then drove their cabs round the boulevards the procession attracting much attention.

A Competition of Speed Controlling Devices.

A new law was passed in Austria in October removing automobiles incapable of exceeding a speed of 25 kilometres per hour from certain restrictions. In view of this the Automobile Technical Association of Vienna is organising a competition for a speed governor which will prevent a car from attaining speeds in excess of 25 kilometres per hour, on level roads, "continuously, reliably and independent of the will of the driver." A prize of 1,000 crowns is set out, which may be awarded to the best or the several equally good solutions of the problem. The device must comply with the requirements laid down in the law referred to. The association will appoint a committee to examine and test the devices submitted, and those which from a study of the drawings and descriptions appear to be the most practical will be first selected, the inventors of these being requested to submit an instrument in two months' time, after which the practical road tests will be carried. The prize will therefore be awarded only to devices actually built and not to mere designs. Entries for the contest, full particulars of which can be obtained from the Association, at 9, Severingasse, Vienna IX 2, will be received until March 15th next.

German Motor-Car Imports and Exports.

The imports of foreign motor-cars and parts into Germany during the eleven months ending with November last only attained a value of £613,455, as contrasted with £831,618 in the corresponding period of 1907. On the other hand, there has been a slight

increase in the exports of automobiles from Germany—from £624,120 to £648,005.

The Prince Henry of Prussia Touring Competition.

The rules of the Prince Henry of Prussia Touring Competition, which is to be held from the 10th to the 18th June next, have now been issued. The event is being organised by the German Imperial, Austrian, Hungarian and Bavarian Automobile Clubs, and is open for all four and six cylinder touring cars of from 7-h.p. to 28-h.p. and capable of carrying four persons. The competing vehicles must belong to the entrant, who must be a member of a recognised automobile club. In order to prevent the entrance of vehicles fitted with "freak" touring bodies, the regulations specify the lines on which the latter must be built, the dimensions in millimetres being shown in the accompanying sketch. The daily runs are as follows:—June 10th, Berlin to Breslau (speed trial *en route*); June 11th, Breslau to Tatra Lomnitz, in the Carpathian Mountains; June 12th, Tatra Lomnitz to Budapest; June 13th, exhibition; June 14th, Budapest to Vienna; June 15th, exhibition; June 16th, Vienna to Salzburg; June 17th, Salzburg to Munich, where the competition will terminate. A speed trial will also be held *en route* on the last day. Entries must be sent to the Imperial German Automobile Club, in Berlin (whence full particulars of the competition can be obtained) not

Diagram of standard body (with dimensions) of cars eligible for the Prince Henry of Prussia Touring Competition.

later than April 1st, together with an entry fee of £25. Late entries can be accepted till May 1st, but only with a double fee of £50. The competition will not take place unless at least fifty cars have entered. On the other hand, if a large entry list is received, the number of competitors may, if considered necessary by the organisers, be limited.

Miscellaneous Items.

The French postal and telegraph authorities in Paris are at present inviting offers for the conveyance of the mails between Bernay-Gare, Giverville and Lieurey by motor vehicles.—The Prussian State Railway authorities are building a number of railway vans specially designed for the transport of motor vehicles.—The Bavarian Automobile Club, of Munich, has just celebrated its tenth anniversary.—While there will be no automobile exhibition in Berlin this year, the German Imperial Automobile Club has decided to organise one for motor-boats, airships, aeroplanes, &c., in March, 1910.

Le Garage d'un Chemin de Fer.

L'automobile réussirait-elle ce miracle de vaincre la routine des grandes administrations? On le croirait volontiers à voir les exemples qui nous viennent de temps à autre. La Compagnie du Chemin de fer du Nord vient d'installer, à proximité de ses ateliers, un garage où les fournisseurs et personnes ayant affaire auxdits ateliers pourront laisser leur automobile. Souhaitons—puisque nous sommes dans la période des vœux—que les autres administrations suivent ce bon exemple.

Motor Touring in Egypt.

The Old and New Methods of Travel at the foot of the Cheops Pyramid.

Old and New Methods of Travel.—Held Up at a Railway Level Crossing.

[Allgemeine Automobil Zeitung.]

MESSRS. WEATHERLEY AND SONS, of Lewisham, an old-established firm of motor repairers and agents, have just opened new and large showrooms.

A PROPOSAL to purchase a motor-car for the use of the Chief Constable of the West Riding of Yorkshire has been deferred until the next meeting of the Standing Joint Committee.

THE Royal Garage, of Theatre Street, Preston, have secured the sole concession in this country for the Passe-Partout cars.

ACCRINGTON motorists are evidently preparing for the season. Mr. James Broadley has acquired a new model 15-h.p. Humber landaulet, supplied by Mr. J. S. Cordingley, of Haslingden.

MESSRS. DUCROS MERCEDES, LTD., have received an order from His Majesty King Edward for a new Mercedes 65-h.p. four-cylinder chassis. The vehicle will be fitted with an exceedingly comfortable type of limousine body by Messrs. Hooper.

THE South Wales Motor Transport and Trading Company, Ltd., have opened new premises in Charles Street, Cardiff. This firm make a special feature of hiring cars for travellers and doctors' use. They are also contractors for the haulage of heavy materials by motor vehicles.

THE firm of Messrs. Wallach Bros. has been turned into a private limited liability company, with Mr. Julius Wallach and Mr. L. C. Wallach, A.M.I.E., as directors. The business will be continued in the Royal London House, Finsbury Square, E.C., on the same lines as those upon which it has been conducted for the past nineteen years.

MESSRS. BUSSY BROS., of Montpelier Vale, Blackheath, are looking after the requirements of motorists in Blackheath in a thorough manner. They have a large garage well lit with arc lamps, and on the occasion of the recent International football match this was in good request. The firm stock a large range of accessories, Vacuum oils, &c.

MR. HENRY SOAR, of 21, Clifton Road, Church End, Finchley, sends us some photographs and particulars of an ingenious combination speedometer and speed-recording instrument that he has lately introduced. The apparatus automatically records on paper the speed of the car as it progresses. It may also be arranged to register the time of starting, the time taken to cover each mile, and to record all stoppages, and the duration of the same.

MUCH has been done of late in the repair of cylinders, crank cases, and broken castings generally, which a few years ago was apparently impracticable. At their works in the Hazelville Road, Hornsey Rise, London, N., the Whittington Engineering Company are now undertaking such repairs by a welding and brazing process which secures the work being turned out in a style that is almost equal to that of new castings. The company is also undertaking the repair of petrol tanks, as well as boiler work.

EVEN the S.E. and C. Railway is assisting to make the roads of Kent safer and suitable for modern travelling. Thus a bridge at Gravesend is being widened entirely at the company's expense, whilst the overline bridge at New Eltham has recently been reconstructed and is now safe for the heaviest motors. The company intend to slightly raise the toll on motor vehicles on their bridge over the river Swale, which connects the Isle of Sheppey to the mainland of Kent, and it is only fair that motorists should pay something towards the cost of upkeep.

THAT the motor-car should have been a silent factor in the remarkable escapade at Tottenham, near London, on Saturday, was apparently in accordance with the modern character of the whole adventure. Two desperadoes, intent on securing bags of money from a motor-car, were making off after firing several shots. A number of people took up the chase. The chauffeur was injured by a shot, but he leapt pluckily to the steering wheel of the car, and some of the employees also entered the car and went in pursuit of the men. They turned into Chestnut Grove with the motor-car gaining on them, and, perceiving this, they discharged shots at their pursuers as they ran. Bullets tore their way through the wind screen of the car, and finally a bullet pierced the radiator.

HERE AND THERE.

THE Municipal Council of Shanghai, China, is in the market for the supply of a petrol motor fire hose wagon.

WE regret to announce the death of Mr. E. J. Jarvis, managing director of Messrs. E. J.

Jarvis, Ltd., motor-car agents, Edgware Road, London, W. The deceased was one of the first cycle agents in London to recognise the possibilities of the motor-car, he taking up their sale as soon as the Red Flag was abolished in 1896.

IT is announced from Peking that the Automobile Club of China has just been formed in that city.

WE illustrate herewith the "Doal" Oil Cabinet, which has just been put on the market by Messrs. Avery and Roberts, Ltd., 64, Stanley Street, Liverpool. The collapsible case is so constructed that immediately the strap is released all the oil cans and lubricators are to hand for use. The arrangement has been specially designed for the purpose of keeping all the oil cans, &c., together; it prevents leakage and rattling, takes up very little room, and is exceedingly handy and compact. The case is lined

with non-absorbent lining, while the contents include a half-pint oil can, a quarter-pint oil can, a screw grease injector, a spring petrol injector, and two small oilers.

THE single-cylinder Sizaire car entered by Messrs. Jarrott and Letts, Ltd., left the R.A.C. Motor House, 18, Down Street, W., on Friday of last week, at 8.11 p.m., and arrived at Edinburgh on the following day at 4.8 p.m. The weather was fine throughout. Near Grantham the spare sparking plug blew out of the cylinder, and nine minutes were spent in replacing it. For this purpose the engine was stopped for one minute. At Markham Moor the car ran out of petrol, and the engine therefore stopped for five and a half minutes while refilling. Otherwise the run to the Scottish capital was absolutely a non-stop one. Messrs. Jarrott and Letts have just issued a booklet which will prove indispensable to all owners of Sizaire-Naudin cars. Practically every main component of these well-known vehicles is illustrated both by photographs and line drawings, accompanying which is a very full and clear description of the purpose and operation of the same. Full instructions are also given as to the care and attention necessary to give to the various parts, the methods of lubrication, adjustment, &c. A number of pages are also devoted to useful hints, which should be of assistance in case a breakdown of any sort is experienced. Some idea of the complete character of the book may be gauged from the fact that it extends to close upon eighty pages, and the only criticism that we have to make with regard to it is that an index to the various chapters and sub-headings might have been included. A copy of the booklet will, we understand, be sent on application. Messrs. Jarrott and Letts have also sent us a very artistic sketch depicting in colours the three Sizaire-Naudin cars which took the first, second, and fourth places in the Coupe des Voiturettes race in France last year. We do not know whether Messrs. Jarrott and Letts propose to send these sketches out broadcast, but we feel sure that all Sizaire enthusiasts would deem them worthy of a frame.

A FLEET OF RACING CARS.

THE accompanying illustration is reproduced from an interesting photograph recently taken at the premises of the Motor House, in Euston Road, London. It depicts a row of seven racing cars, each with its history. The first car, fitted with Rudge-Whitworth wheels, is the 135-h.p. Mercedes, run with such striking success at Brooklands. It will be remembered that this car missed the Grand Prize of £1,500 in the first Montagu Cup Race owing to the driver (Resta) running past the finishing straight at the conclusion of the race. The second vehicle formed one of the 120-h.p. Mercedes team built for the first Grand Prix race in 1906, which was won by Sziisz on a Renault. It has since taken part in many smaller events with unvarying success. The third car is a 90-h.p. Mercedes built for the last Gordon Bennett race, which was won by Thiery on a Brasier. The fourth machine is the Mercedes which made world's records for a number of distances at Nice so long ago as 1902. No one looking at the car can appreciate that it could possibly have been constructed so long ago, as it compares favourably in all details with those of the present day, while the condition of all wearing parts is so good that very slight repairs were found necessary to put it in proper order.

and condition. The fifth car also formed one of the 120-h.p. Mercedes team for the first Grand Prix, and was purchased by the Sultan of Johore after the race. He had a short tonneau body fitted to it so as to make it suitable for touring purposes. The sixth machine is a Rochet-Schneider, built specially for the Semmering Hill Climb, which it won. The seventh car is the 120-h.p. Darracq which ran away from the field for the first few laps in the first Montagu Cup Race at Brooklands. Seeing that it is very unlikely that any more high-powered racing cars will ever be built, the above cars, with several other racers, form an interesting exhibit at the Motor House at the present time.

Now that the Post Office authorities are using motor mail vans on a large scale, it is interesting to recall the fact that the first trial made for the Post Office was undertaken by Mr. C. H. E. Rush, in November, 1896, with a 6-h.p. Panhard vehicle.

A PROPOSAL is under consideration to construct an automobile track, twenty-six miles long, near Indianapolis, U.S.A. A tract of land one mile long and one-half mile wide is stated to have been purchased. The track at the outer edge will be two miles long, winding towards the centre, making in all a twenty-six mile course.

THE New York Board of Aldermen has recently issued a new regulation to the effect that "No operator of any automobile or other motor vehicle, while operating the same upon the public highway, within the city, shall use any acetylene, electric or other headlight, unless properly shaded so as not to blind or dazzle other users of the highway, or make it difficult or unsafe for them to ride, drive or walk thereon."

THE SOCIAL WHIRL.

NEW members of the Royal A.C. include the Earl of Gifford, Baron Percy De Worms, Sir John Dickson-Poynder, M.P., Sir R. Macleod of Macleod, Count Bela R. Zichy, Hon. L. V. Harold Willoughby, Sir Wilfred Peek, Bart., Sir Frederick Robinson and Captain T. M. Kincaid Smith, M.P.

MR. JULIAN ORDE, of the R.A.C., has disposed of his 45-h.p. Daimler and expects delivery of a new 50-h.p. Silent Daimler early in April. At the present time I notice he has a four-cylinder 16-20-h.p. Rover in use.

LORD STRATHCONA has accepted the presidency of the Imperial International Exhibition which is to be held at the "Great White City," Shepherd's Bush, from May to October of the present year. Mr. Imre Kiralfy will again be the Commissioner General, and among the General Committee are the managers of most of the leading railway companies, the presidents of various Chambers of Commerce, and many gentlemen of influence in the industrial and commercial centres of the country.

Place aux Dames. I learn from Paris that a ladies' aeroplane club, "Les Aériennes," is being formed in London, and, although little is known concerning the venture on this side, the news is interesting. Already we have quite a number of associations, the members of which are seeking to navigate the air; the advent of a club for the ladies who would fly is quite in the natural order of things nowadays.

LADIES, as a rule, take considerable interest in the doings of the provincial automobile clubs and are eager participants in their runs. Last season more than thirty ladies attended the meets of the Sheffield A.C., adding greatly to the popularity of the various events. Prizes were offered to those who made the best attendance at these runs, and I hear that these were won by Mrs. Herbert Beesley and Mrs. Gerald D. Flather, who each made exactly the same number of attendances.

THE Earl of Kimberley left for the Continent a day or two after attending the dinner of the R.A.C. and Associates. His lordship is chairman of the Motor Car Act Committee of the Norfolk County Council, which has just submitted a useful report to that body in favour of erecting warning notices on roads where the danger is not plainly obvious to the careful motorist, and of adopting a uniform system of warning in connection with concealed corners. The Council has accepted the offer of the Norfolk A.C. to provide ten danger posts, on condition that their maintenance is guaranteed by the local authorities.

MOTORISTS generally receive impartial treatment at the Bromley (Kent) Police Court. Mr. J. Coles Childs, J.P., the chairman of the bench, is a motorist, owning and driving a six-cylinder car. Judge Emden, of Bromley, whose verdicts on recent car obstruction, cross-road collision and other cases have been so much quoted, is also an enthusiastic motorist, and he makes use of his Talbot car wherever possible.

ONE of the most successful house dinners held at the Motor Club, in Princes Street, W.C., was that which took place in connection with the British Motor Boat Club last week. Mr. C. Temperley was in the chair, and among those present were Admiral Sir William Kennedy, Col. W. J. Bosworth, the Hon. Algernon Bourke, the Hon. J. W. Taverner, and Hon. C. H. Rason, the two latter gentlemen being the Agents General for Victoria and Western Australia respectively.

AT the R.A.C. dinner Sir Henry Rawlinson pleaded for the encouragement of the Territorial Army by motorists, and on Tuesday Mr. Haldane motored along the worst road in London to Stratford in the interests of his scheme. Curiously enough the eastern suburb has a non-motoring M.P., although the adjoining divisions of Bow and Romford are represented by two enthusiastic motorists—Sir J. H. Bethell and Mr. Stopford Brooke. LOLLUS.

ON PASSING TRAMCARS.

THE ACTION OF THE CHIEF CONSTABLES.

NOW that the Lord Chief Justice has declared that the regulation of the Local Government Board with regard to the passing of tramcars by automobiles is not in accordance with safe practice, there is little doubt that the Royal A.C. will meet with success in their forthcoming application to Mr. John Burns. As Sir Edward Henry reminded the company at the R.A.C. Associates' dinner, the removal or revision of Art. IV. of the L.G.B. regulations with regard to motor-cars is not a matter for Parliament; it is within the province of the Department of State. Before the reassembling of M.P.'s on the 16th prox. the matter should be settled.

Meanwhile, some of the Chief Constables, recognising the absurdity of the position—almost Gilbertian, as Mr. J. E. Hodgkin suggested last week—have determined to be guided by their own common sense. We learn that Mr. A. J. Atkinson, Dr. Coates, and Mr. G. H. Strong, representing the Hull and District A.C., have, on behalf of the motorists in that district, taken up the matter with Major Malcolm, the Chief Constable of Hull. As the result of their interview, the Chief Constable has issued an order to the police to the effect that if a motorist chooses to overtake a tramcar on the right, or off side, there can be no action taken against the driver, unless by his act he causes danger to the public. On the other hand, the police will not interfere with the driver of a motor-car who conforms to the old and certainly the safer plan of passing a tramcar on the near side. In a communication to ourselves Major Malcolm points out that "any attempt of a driver to pass on the right side would be fraught with very great danger."

The Chief Constable of Birmingham informs us that he is not issuing any special instructions in that city, but he gives the assurance that "no summons is likely to be issued against motorists in connection with a similar case here. There are many streets in the city only sufficiently wide for a single tram line in the middle, and room for one vehicle at each side. Along the single line the tramcars pass alternately, first in one direction and then the opposite. If vehicles were to pass trams going in the same direction on the off or right side of these streets they would meet the down-coming traffic, and the result would be that the motor-cars would either not be able to pass the tram at all, or would infringe sub-section 3."

At Coventry, Mr. C. C. Chursley, the Chief Constable, has taken an equally common-sense view of the matter, and has given similar instructions, adding in his letter to us on the subject that "it has been found in our narrow streets to be practically impossible to conform with the rule of the road as laid down without incurring great danger to traffic coming from the opposite direction."

Elsewhere we believe the police authorities, while recognising the absurdity of the present regulation, have decided to await events, by which we take it no prosecutions will be authorised. Thus Mr. W. E. Jones, the Chief Constable of Southampton, is "waiting the decision of the L.G.B. on the action taken by the Royal A.C.," and at Bournemouth the matter is still under consideration. This attitude is not isolated, but is typical of that adopted in several places. Bradford is, perhaps, an interesting exception, for, according to Mr. J. Farndale, the Chief Constable of the town in which the test case occurred, "the practice which will operate in this city will be in accordance with the law as defined by the courts."

In some distinction to the views of other tramway managers—most of whom, it will be remembered, were inclined to agree with the Lord Chief Justice in regarding the regulation with disfavour—is that of Mr. F. Schofield, the tramway manager for the Leyton Urban District Council, who writes:—

Dear Sir,—I am of opinion that the Bradford test case with regard to the passing of trams by motor-cars is extremely useful as a precedent. The question of right or wrong side of the road is very definite, and this was more than confirmed by the Motor Car Act of 1904. There would no doubt be a very great risk to users of tramcars if the general rule was allowed to be violated by fast travelling vehicles, and this particularly so having regard to the high speed

which motor-cars attain and the silence with which some run. The conditions of the road must of course be an important factor of a case, and should to a certain extent govern which is the right or wrong side. We have in Leyton several places where it would be really dangerous to pass on the off side of a tramcar; but this, of course, is the exception and not the rule.—Yours faithfully,

F. SCHOFIELD, Tramways Manager.

One of the managers of a leading corporation tramway system in the north of England, who, however, does not wish his name published, informs us that he has had no difficulty with regard to motor-car traffic, but "it has been observed that motor-cars pass on the left-hand side of the car when following rather than on the right or off side, and providing the motor-car slackens speed or stops when the tramcar is picking up or setting down passengers, undoubtedly the left-hand side of the road is the proper side to pass. To pass on the off side is extremely dangerous. First, he cannot be certain that a car may not be coming in the opposite direction, neither can vehicular traffic be avoided which may be coming in the opposite direction, and the motor-car driver could not see it until he had got round the car he was endeavouring to pass."

In connection with this matter we may recall that the regulation with regard to automobiles, against which such universal, as well as legal, protest is made, is Article IV. of the Motor Car (Use and Construction) Order, 1904, sub-section 3 of which is to the following effect, the words upon which the Bradford case was determined being italicised:—

He shall, when meeting any carriage, horse, or cattle keep motor-cars on the left or near side of the road, and when passing any carriage, horse, or cattle proceeding in the same direction keep the motor-car on the right or off side of the same.

Traction engines are governed by the special Acts applying to such vehicles. Bicycles are regulated by the Local Government Act, 1888, Sec. 5, and other vehicles by the Towns Police Clauses Act, 1847, Sec. 28, and by the Highway Act, 1835.

The sub-section which we have quoted from the Motor Car (Use and Construction) Order, 1904, is apparently an imperfect adaption of Sec. 28 of the Towns Police Clauses Act, 1847, governing ordinary vehicles. This section makes it an offence for any person who, to the obstruction, annoyance, or danger of the residents or passengers, commits certain offences. With regard to the passing of other vehicles, the offence is stated to be a person "who in passing another carriage does not keep his wagon, cart, or carriage on the right or off side of the road except in case of actual necessity or some sufficient reason for deviation." Article 4 of the Motor Car Use and Construction Order, 1904, in its preamble omits the words to the "obstruction, annoyance, or danger of the residents and passengers," and it makes the Order that persons shall comply with the regulations therein set forth. The regulation under Sub-section 3 says that he shall, when passing any carriage proceeding in the same direction, keep his motor-car on the right or off side of the road, and it does not give him any option such as contained in Sec. 28 of the Towns Police Clauses Act, 1847, to use his own discretion, as the words "except in case of actual necessity or some sufficient reason for deviation" are omitted.

THE following advertisement appeared in last week's issue of a Dartford paper under the head "Garage or Stabling to Let." "To cowkeepers, motorists, and others; magnificent premises, situate —, rent —, five stall stables, large coachhouse; good lofts, &c.—Apply."

It is proposed to hold a four or five days' Motor Reliability Trial in Northern India during the spring. A committee is being formed, with Mr. C. U. Knox, c.o. Messrs. Cox and Co., Rawalpindi, as secretary. The run as at present proposed is:—Lahore, Rawalpindi, Malakand Fort (hill climb), Rawalpindi.

WHAT is to be, in more than one sense, a moving picture show, is a combined motor vehicle and picture machine for which a patent has been granted to Messrs. J. H. Gravell, of Philadelphia, and Mr. G. D. Farwell, of Bridgeport, U.S.A. The specifications of the vehicle include the necessary machinery for the exhibition of moving pictures; an electric generator for operating the show; and a motor which can be employed either in propelling the vehicle or in driving the electric generator.

MOTERING ACCESSORIES.

The "Ideal" Tyre and Tool Holder.

We illustrate herewith two devices which have lately been put on the market by Messrs. Schofield and Co., of the Tulketh Works, Southport, and which will be found extremely useful additions to the equipment of a private garage. Fig. 1 depicts the "Ideal" holder, by means of which tyres or covers can be safely stored away from the bad effects

Fig. 1.—The "Ideal" Tyre Holder.

of water and grease, which are often found on garage floors. The device will hold any size and diameter of cover, and correctly fits the circle, while as the cross bars are made convex in section, there are no sharp edges to injure the tyres, which are supported at two places. The second handy arrangement is the "Ideal" adjustable tool holder shown in Fig. 2. This is so arranged that it can be nailed to the wall over or close to the bench, so that the required tool can be seen and withdrawn at a glance. The

Fig. 2.—The "Ideal" Adjustable Tool Holder.

adjustable sliding bars can be set straight or at varying angles and spaces so as to take various sizes of tools. Eight hooks are also provided on which to hang the larger tools. Other useful specialities of Messrs. Schofield include a car sponge basket, a radial holder for brushes, mops, and odd tools, and the "Ideal" oil tray, of strong galvanised sheet steel, with stiff top edge.

A Motor Tube Tester.

In connection with the vulcanization of motor tyres, Messrs. Harvey Frost and Co., of 39, Great Eastern Street, London, E.C., have attained fame as pioneers as well as in the scientific development of the business, to its present altitude. They have now brought out a motor tube tester and puncture finder, which will materially ease the burden of the motorist distressed by such an unpleasant condition of things as the puncture generally assures. The method of operation is simple. Firstly the tube is inflated to its ordinary running pressure, this being possible without risk of distension by placing the tube within strong netting fastened to two rims. These are clipped together when the tube is placed in position. The tube and tester together are then immersed in a water bath of special design. This provides for plenty of water for the purpose of discovering defects. The device has the advantage of occupying only a little floor space, while one instrument will be sufficient to deal with a given range of tubes.

Millennium Key Spanner.

Mr. R. Broadhurst, of Smithford Street, Coventry, has now taken up the Millennium motor accessories and specialities, one of which is illustrated in Fig. 3. The convenience of this device is clearly apparent. The set consists of twenty-six key spanners, an extension piece, a ratchet spanner or universal joint and a handle which fits both the spanner and the universal joint. The key spanners will fit all nuts, either of English or French sizes, and can be used (1) with the ratchet spanner alone, thus corresponding to improved bent box spanners; (2) with the ratchet spanner

Fig. 3.

and extension piece, thus corresponding to improved straight box spanners; and (3) with the Universal joint, with or without the ratchet or extension piece, thus enabling nuts to be turned which are inaccessible to any

The Rotax Petrol Store.

The Rotax Motor Company, of Great Eastern Street, London, E.C., have several good devices for the motorist, including foot warmers, speed indicators, lamps, horns, &c., as well as a new petrol store—an accessory for the garage which may appropriately be referred to at a time when the dangers of petrol are being so persistently advertised in the general Press. This Rotax petrol store is made with a water course round the top, upon which the lid effectually shuts down. Thus any vapour that may be within is kept from escaping into the open air. There is also a quantity of water kept within the tank. At the bottom of the chamber is a valve which releases as the lid is raised, so that any surplus water or any petrol leaking from the tins is passed away. Should, by any chance, the petrol in the tank become ignited, the fire can be extinguished simply and safely by closing down the lid. The store, which we recently inspected in the company's motor department, has a capacity for ten two gallon tins, and should be regarded as an indispensable adjunct to motor garages.

The "Roslee" Generator.

Messrs. J. T. Williams and Co., of 344, Newtown Row, Birmingham, have had long experience in the design and construction of lamps for vehicles of all kinds. They are turning their attention to those for automobiles, and from our own experience we can testify as to the importance of the work they are doing for motorists. A personal test over four months gives assurance as to the steady light which is uniformly given at all speeds of the car. An illustrated description will be given next week.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE "GATE CHANGE" PATENT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may be within your recollection that on December 4th I addressed to you a letter calling the attention of your readers to the fact that if the holders of the patents in connection with this form of device proposed to take steps to enforce what they considered to be their rights on the matter, it might be a course of action fraught with uncertainty and possibly annoyance to the general body of automobilists. I further mentioned that during Olympia Show I was approached by a director of the company which holds the patents, who informed me of the intention of his company to demand a royalty on Imperia chassis fitted with gate gear.

Acting upon the support and sympathy shown me by other importers, manufacturers, and the Press, I called a private meeting of the trade at the Hotel Cecil on the 12th inst., to discuss the situation, and two days later the Society of Motor Manufacturers and Traders in council resolved that when the formal demand for royalty was made the Society would

THE M.M.C. 8-H.P. CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you kindly advise me on the following subject? I have an M.M.C. 8-h.p. small, low-built four-seated car, which is possibly, I suppose, about four years old, perhaps more. It has all been thoroughly overhauled, worn parts replaced by new; the engine, gears, &c., are all in splendid condition (it has three speeds and reverse), the valves have been ground in, and everything has been done to make the car as perfect as possible. It runs fairly well, but the exhaust pipe after a very short time gets red hot. Should same get hot like that, and is there any danger? Would you think there is anything wrong? Is there any remedy to prevent same? The engine itself does not appear to get overheated, and everything seems to work all right. Also to start the engine sometimes takes a very long time and seems a hard job. I have to keep flooding the carburettor; over half-an-hour yesterday before I could get her to move, and in which time the engine got terribly hot. Do you think the water circulation can be all right? So far as I can

The James-Anderson Steam 'Bus built about 1829.

spend money to investigate the validity of this gate gear and other patents. The Mercedes Daimler Motor Company, Ltd., has announced by circular letter that it is prepared to grant licences for use of the gate gear and other details such as are to be found on motor-cars, and we may readily surmise that it will carry out its threat, embodied in the circular, of taking vigorous action against not merely manufacturers, importers and sellers, but users of cars as well.

I wish to assure your readers that should that threat take effect they may rely upon the support of manufacturers and importers.

The Society of Motor Manufacturers and Traders having been approached will spare no reasonable expense in investigating the merits of the claim, and, as is more than likely, should there be any legal proceedings in this connection hereafter, the public may be certain of the trade standing together to protect their own rights and the rights of their clients.

It behoves all interested in this important matter, whether manufacturers, importers, sellers, or users, to help to present a united front against possible attack.

A committee, on which I have the honour to serve, has been formed to consider the best means of so doing, and any information or communications on this subject addressed to me at 66, Great Russell Street, W.C., will be laid before and carefully considered by the committee.—Yours truly,

C. E. WHITTAKER.

gather it appears to be; but do you consider there might possibly be something in the water tank to occasionally cover the outlet from the tank? The engine has had a fit or two of completely stopping itself perhaps in the middle of a country road, and yet I can see nothing wrong.

At about what speed should this type of motor average, and about how far to the gallon of petrol should it run? I might mention the engine unfortunately takes but very little air. Your advice upon this subject will be much appreciated.—Yours truly,

AMATEUR.

[We should be first of all inclined to think that the exhaust pipe getting red hot may be due to the silencer being clogged up, and we would recommend our correspondent to have this dismantled and cleaned, if it has not already been done. Although it is stated that the engine does not appear to over-heat, it might be well to see whether the radiator and water jackets have become scaled owing to deposit from the water. The fact that the engine will, when running, only take very little air may be another cause of the red hot exhaust pipe owing to the motor working with a too rich mixture. To start the engine the air lever on the steering column should of course be closed, but once the motor is running it ought to be possible to pull up the lever almost if not quite to its full extent. The fact that it frequently takes a long time to start up the engine would seem to indicate that the timing of the ignition may not be perfect. Have the two-to-one gear wheels been at any time dismantled? It is very necessary when this is done to see that when the pinions are replaced

they are put back in exactly the same position as before. A good plan to facilitate starting the engine is to open the compression cock on the top of the cylinder head and squirt in by means of a small cycle oilcan a few drops of petrol. By adopting this method the motor will usually start up with the first or second turn of the handle. We should put the average speed of an 8-h.p. M.M.C. car on give and take roads at from fifteen to sixteen miles per hour, and the petrol consumption at about thirty miles to the gallon.]

ACCESSIBILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very glad to see the letter of "Experientia Docet" in the last issue of the *M.C.J.* Your correspondent apparently writes from experience, and I can heartily support all that he says. In the case of my own car it is quite a difficult matter to take down the water circulating pump, and the operation cannot be effected without having to lie on one's back on the floor underneath the car, and even then it is with the greatest difficulty that one can get a spanner on to the nuts that have to be removed. Many a time I have wished that the designer of the car in question had been at hand when that pump has needed attention. The carburettor, too, is so placed that it was only after I had had the vehicle a year or so that I discovered a screw the purpose of which, when it is withdrawn, is to allow any sediment in the petrol union below the float chamber to be cleaned out. What the use of the screw is it is difficult to see, as when the carburettor is in its proper position it is impossible, owing to other things being in the way, to get a screwdriver near the screw. While I am not in favour of sacrificing durability to accessibility, there is no doubt still much room for improvement in arranging these parts of a car which do occasionally need attention in such a way that the attention can be given with a minimum of trouble.—Yours truly,

AD SUM.

The "Sheffield-Simplex" 45-h.p. Car recently delivered to Mr. Stanley Brotherhood, of Merton Wood Hall, Worplesdon, Surrey. The vehicle, which is fitted with the ordinary three-speed gear-box, is equipped with a handsome Limousine, painted green and luxuriously upholstered in light drab by Hamshaw, of Leicester.

SPARE WHEELS ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wonder if it has occurred to you how ludicrous modern cars are beginning to look? I refer to those which are now carrying a complete spare wheel and tyre on the step. It certainly does not give one an impression of the reliability of motor vehicles to see them going around with a complete spare part open to the public gaze in this way. If it is desirable to carry a spare wheel, I think it would be much better if some means were devised whereby it could be carried out of sight. Would it not be possible to arrange for this in some part of the body? A year or so ago a motor firm introduced a body in which an ingenious cupboard was formed in the part behind the back seats. The idea struck me as a good one, and I cannot but think that it is one well worth developing.—Yours truly,

R. W. H.

THE DANGERS OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was pleased to read in a recent issue the interesting letter from Mr. Haydon, in which he calls attention to the disastrous results which may follow the careless handling of petrol, and I trust that, coming as it does from an authority, the warning may open the eyes of the public and create a due appreciation of the deference demanded by our motive spirit.

The ignorant are not the only offenders in this respect, as many motorists err on the side of familiarity, and numerous accidents, causing both personal injury and damage to cars, have been the result. Two such accidents occurred in my district. In the first, a friend of mine was filling up on the road at night, and, due to erratic pouring, splashed a

quantity of petrol over the coachwork and upholstery of the car. The vapour from this was ignited by one of the side lamps, and the fire which followed did serious injury both to my friend and his car. In the second case, a local dealer was replenishing the tank of a motor-cycle, using a lamp to direct the pouring and also to ascertain the quantity of spirit required. As far as personal injury is concerned, his case was far worse than the first.

These accidents proved clearly to me that the method of filling by means of a funnel is a most undesirable one, and may prove a fruitful source of accident. A large free surface of petrol is exposed, from which evaporation rapidly takes place, and in addition, in the hands of most persons, the petrol evinces a desire to flow spasmodically, causing splashing and waste. After a lot of thought and experiment, I have devised a means of overcoming these difficulties and performing the awkward operation of replenishing the tank in a safe and clean manner. The apparatus, which I have called the Auto-Syphon, was reviewed in your issues of July 4th and August 15th, 1908, and I shall be pleased to forward particulars to any of your readers who may be interested in the same.—Yours truly,

W. DEAN WILLIAMSON.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a constant reader of your valuable paper, I beg to ask whether any of its readers can give me any advice on a 24-h.p. De Dietrich car. The vehicle has recently lost power on hills which it used to take without any trouble, and being in the neighbourhood of Porlock, it is important to be well on the hills. The car, however, fails on them, although it is all right on the level. I have thoroughly overhauled the engine, ground all the valves, but without success.—Yours truly,

CHAUFFEUR.

[Of all the questions which are dealt with in these columns there are none which are more difficult to answer, on account of their vagueness, than a complaint of "loss of power." The fact that the car is a De Dietrich 24-h.p. explains no more than if a man went to a doctor and said, "I am a Frenchman, fighting weight ten stone, I do not feel well, what is the matter with me?" "Chauffeur" says he has overhauled the engine thoroughly, but we are inclined to doubt if he has succeeded in putting it in thorough order; for, in the absence of evidence to the contrary, we should ascribe poor performance *on hills only* to something amiss with the engine. The valves have been ground in; so far so good; but is the compression perfect? If not, what about the state of the cylinders, pistons and rings? It often happens that merely taking these parts to pieces and cleaning them results in worse compression when reassembled than before. Perchance "Chauffeur" has found this to be the case with his motor; if so, he must take it to pieces once more, and have things made as perfect in the quarter we have indicated as we have no doubt he has succeeded in doing with the valves.]

THE COST OF UPKEEP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if any reader of the *M.C.J.* would favour me with information on the following points, i.e.: Is the upkeep of a four-cylinder 14-h.p. car much in excess of a 10-h.p. two-cylinder or 8-h.p. single-cylinder? What is the cost, roughly, of running 1,000 miles on a 14, 10, and 8-h.p. respectively? Is a four-cylinder car much more complicated than a two or one? I may say that I intend buying a car and looking after it myself, and do not want one that will prove too costly to run.—Yours truly,

R. J. SEFTON.

SAXONELLE.—We have an inquiry for the makers of "Saxonelle," a grease which is used to put on brass work after it has been cleaned, to prevent tarnishing.

A LID and inside rim of a tyre trunk were found between Longford and Colnbrook on the 16th inst. If the owner will communicate with the Secretary of the Automobile Association, Princes Buildings, Coventry Street, London, W., every assistance will be afforded him.

ACETYLENE LAMPS IN FOGGY WEATHER.—In reference to the letter from "Sussex" on the above subject, Messrs. George Polkey, Ltd., Birmingham, write:—"From personal experience, we can confirm that acetylene lamps are absolutely useless in foggy weather; as a matter of fact a motorist would be better off without the lamps, as the fog reflects back the light into the eyes of the motorist. We would point out that we are the makers of a paraffin head lamp for motor-cars which is specially suitable for use in foggy weather. The light from these lamps, being more diffused than that of the ordinary acetylene lamp, pierces through a fog."

AN examination for the R.A.C. certificates was recently held in Malta, the candidates being soldiers of various regiments stationed in the garrison.

TENDERS are at present being invited by the French post and telegraph authorities in Paris for the transport of the mails between Grasse and Castellane, in the Lower Alps, by motor vehicles.

THE "GATE CHANGE" PATENT.

(Concluded from page 1023.)

BELOW we give the concluding portion of the patent granted to Herr Gottlieb Daimler in 1899 for "engaging and disengaging device for gearing" which covers the gate change.

In the example already described the hand-lever H slides within a quadrant M provided with recesses 1, 2, 3 and 4. The middle of this quadrant is cut, so that the hand lever can be conducted from one recess into another only after the hand lever has been brought into its middle position. Also in this construction the hand lever H is provided with a nose h^1 with semi-circular surface which in the middle position of the hand lever keeps the friction coupling device out of gear, as represented in Figs. 1 and 3. By this construction of quadrant the alteration in the gearing up of the different toothed wheels cannot take place before the friction coupling as well as the gearing have been put out of gear. Figs. 3-6 illustrate an arrangement of gearing with four pairs of toothed wheels, the friction coupling as well as the toothed wheels being out of action, whilst Figs. 7-9 show the same mechanism in gear.

Figs. 10 and 11 show a modified form of construction for disengaging the friction coupling device, in which the nose h^1 effecting the disengagement of the friction coupling is not attached directly to the hand lever H

with the toothed wheels $E^1 F^1$. In the meantime the nose h^1 has liberated the rod i , so that the friction coupling is put into gear and the direction of rotation of the countershaft G is reversed by the indirect transmission. It will be observed that the gear wheels during the above operation are left in their disengaged position, and that the wheel E^5 is of sufficient width to engage a pair of the speed gear wheels $E^1 F^1$ when in this disengaged position.

In this device also the mechanism has been so arranged that the lever must be brought back into its middle position, that is to say, that the gearing as well as the friction coupling must be disengaged before the intermediate wheel can be brought into gear. To attain this object, the guide M is provided with a fifth recess V. When the hand-lever is brought back into the middle of the quadrant, the sliding-piece O descends and the wheel E^5 is disengaged by means of the crank lever m ; during the whole process the gearing remains out of gear. In order to prevent a mishap in effecting a backward motion instead of a forward motion, it is necessary to determine the lateral displacement of the hand lever; this is effected by a bolt closing the recess V of the hand-lever guide M. Figs. 18 and 19 show a detail view of such a guide. The bolt r is kept downwards by means of a spring f and can be lifted by a handle g so that a connection will be effected between the recesses III., IV. and V. When it is desired to move the hand-lever aside into the recess V, the bolt r is laid back, and the hand lever introduced into the recess, whereupon the bolt returns into the closed position by means of the springs f . When withdrawing the hand lever the bolt is opened automati-

as before explained, but to a special shaft moved by means of a toothed segment z^1 . This segment z^1 is large enough to remain in constant engagement with the segment z fixed to the hand-lever H. The purpose of this construction is the same as the purpose of the original construction, that is to say, the nose h^1 will act upon the rod i and put the friction coupling out of gear. The latter arrangement has the advantage that it can be used with very small toothed wheels, as the hand-lever has only a short movement which is conveniently transmitted owing to the special arrangement of the segments z and z^1 . The rods $J^1 J^2$ serving to alter the position of the toothed wheels are kept in middle position by means of springs n , so that the one pair of toothed wheels is secured against any displacement whilst the other is put into or out of gear. The mechanism for reversing the direction of rotation is represented in Figs. 12-18. Upon the first pin of the hand-lever H a second segment h^2 is attached. This segment h^2 engages with the rack of a rod J^3 . This rod J^3 is provided with a pin p sliding within an inclined slot S of the sliding piece O. This sliding piece O is vertically movable and is connected to a crank lever m carrying on its free extremity a toothed wheel E^5 . Figs. 12 and 14 show the position of the mechanism when the hand-lever H is in the middle position. If now the said lever is moved axially on its pivot pin, so far that the segment h^2 is out of engagement with the rods J^1 and J^2 , and the segment h^3 engages with the rod J^3 (as shown in Fig. 17) when the hand-lever is moved to the right hand side, the rod J^3 will be moved to the left by means of its engagement with the toothed segment h^3 . Owing to the inclined slot s the pin p lifts the slide-piece O, whereby the crank lever m is actuated and the toothed wheel E^5 is brought into gear

cally, the hand lever can be moved sideways and the bolt returns back into its original position.

It will be understood that in all of the devices described above it is preferred to make the nose or cam h^1 on the lever H of such dimensions that the friction clutch is not allowed to come into operation until one pair of the speed gear wheels has been brought into mesh; this arrangement will permit the gear wheels to be brought properly into mesh with one another before driving commences.

Having now particularly described and ascertained the nature of my said invention, and in what manner the same is to be performed, I declare that what I claim is:—

1. In an engaging and disengaging device for gearing the combination of a friction clutch, change-speed mechanism driven through the medium of the friction clutch, a lever such as H operatively connected with the change-speed mechanism and with a nose or cam whereby the friction clutch is thrown out of gear when either of the speeds is disengaged substantially as described.

2. In an engaging and disengaging device for gearing, comprising a friction clutch and change-speed mechanism, the employment of a spring controlled lever such as K, whereby the friction clutch is always brought into operation except when the said lever is forced back against the action of its spring by means of a nose or cam connected with the operating lever of the change-speed mechanism substantially as described.

3. In an engaging or disengaging device for gearing, of the kind described the combination with an operating lever such as H of two or

more change-speed mechanisms, the lever being free to slide axially so as to engage any one of the speeds as required substantially as described.

4. In an engaging or disengaging device for gearing of the kind described the combination with an operating lever such as H of a quadrant having two or more longitudinal slots communicating with one another at a point midway of their length, with or without a bolt or lock device across the point of communication substantially as and for the purpose described.

5. In an engaging or disengaging device for gearing of the kind described the combination with an operating lever such as H of a toothed segment for engaging any one of the clutches of the speed gear as required with or without a similar toothed segment for operating the nose or cam and with or without a separate segment for operating reversing gear substantially as described.

6. In an engaging or disengaging device for gearing of the kind described, in which the operating lever is free to move axially the combination with the change-speed gear of a reversing mechanism comprising a toothed wheel adapted to be brought into engagement with one pair of speed gear wheels when the said wheels are in their disengaged position substantially as described.

7. In an engaging and disengaging device for gearing, the combination of a shaft B suitably fixed to a friction coupling, consisting of a friction cone D and a casing A, toothed wheels E¹ E² sliding on said shaft B, a hand-lever H moving within a guide M, a rod J¹ connected to the toothed wheels and to the lower extremity of the hand lever H, levers K connected to the shaft B, a nose A¹ fixed to the hand lever H and pushing against the lever K, a spring L effecting a tension upon the lever K, a fore shaft G running in suitable bearings, toothed wheels F¹

TOURING IN BOSNIA.

1. A Zigzag Road. 2. At Narenta-Defile. 3. A Bosnian Semmering.
4. A View near Peggau.

F² rigidly connected to said fore shaft, substantially as and for the purpose described.

8. In an engaging and disengaging device for gearing, the combination with toothed wheels E¹ E² a rod J¹ provided with teeth, toothed wheels E³ E⁴, a rod J² in construction similar to J¹, a hand lever H carrying on its bottom end a toothed segment A², a guide M provided with four recesses, a fore shaft G, toothed wheels F¹—F⁴ rigidly connected to the said fore shaft, substantially as and for the purpose described.

9. In an engaging and disengaging device for gearing, the combination with a hand lever H moving in a guide M having five recesses, a toothed segment A², a rack J³ engaging with said segment, a slide piece O provided with an inclined slot S, a pin P sliding within said slot, a crank lever M attached to the slide piece O, a toothed wheel E⁵ connected to the slide piece O, substantially as and for the purpose described.

PUBLIC SERVICES.

THE Scotland Yard authorities have notified their approval of the new Lee-Trigwell Detachable Skidless Band and Tyre Protector for use on the taxi-cabs in the Metropolis. This has been introduced by the Automobile Contract Company, Ltd., 51, Co. duit Street, W., and was recently described and illustrated in our columns.

CAPTAIN H. B. CRESSWELL and Mr. H. G. Norris (until recently manager of Itala Automobiles, Ltd.), having combined forces under the title of Cresswell, Norris, and Co., Ltd., with offices at 199, Piccadilly, W. The new concern intend to devote their energies to the sale of cars of every make, and will shortly specialise on repairs.

THE EDINBURGH MOTOR SHOW.

THE twelfth annual Scottish Motor Exhibition opened in the Waverley Market, Edinburgh, on Friday last week and closes to-day (Saturday). It has been organised by the Scottish Motor Trade Association, Ltd., of which Mr. Thos. Shaw is president, and was inaugurated by the Rt. Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland. The show is the largest which has so far been held north of the Tweed, all the leading British and foreign cars being on view, in addition to which are to be seen a number of industrial motor vehicles, motor-boats, and a large display of accessories.

One of the largest stands is that of Messrs. Thomas Shaw, Dundee, Ltd., the exhibit comprising a Beeston Humber 16-h.p. phaeton, an Ariel 30-h.p. polished chassis and a number of Siddeley cars. Messrs. Jas. Gibbon and Son, Glasgow, in addition to examples of the various models of Rover cars, have on view three Talbot vehicles of respectively 12-16-h.p., 15-20-h.p., and 25-40-h.p. A full range of Peugeots, extending from 9-h.p. to 35-h.p., is exhibited by the Caledonian Motor Company, Ltd., Aberdeen.

The stand of the Daimler Motor Company, Ltd., is as usual attracting considerable attention, as, in addition to a couple of complete 38-h.p. cars, a 57-h.p. six-cylinder chassis and a 38-h.p. silent engine cut away to show the action of the new design, are shown. The Scottish Automobile Company, Ltd., Edinburgh, give prominence to Humbers and to two Mors 15-h.p. vehicles, one having a two-seated body and the other a landaulet.

The St. Vincent Motor and Cycle Company, Ltd., Glasgow, show a "St. Vincent" char-a-banc of their own construction; it is arranged to seat twelve persons, and is fitted with a 14-16-h.p. two-cylinder engine. They have also on view two B.S.A. chassis and a full range of Aster motors. Messrs. Rossleigh, Ltd., display both Siddeley and Napier cars, and in addition have on view a Standard six-cylinder car with side-entrance body and a similar vehicle arranged as a two-seater. The Mass 15-h.p. cars are exhibited by the Belhaven Engineering and Motors, Ltd., Glasgow, who are also showing a Belhaven 30-cwt. chassis and a 2-ton van of their own construction. An excellent display of the 16-h.p. and 30-h.p. Vinot machines is made by Mr. T. Roland Outhwaite, of Cupar-Fife, while a chassis of the Sheffield-Simplex 45-h.p. six-cylinder without the usual gear-box is exhibited by the Scottish agents, Messrs. Middleton and Townsend, Edinburgh, who also show Brasier and Riley cars.

The Stanley steam cars, both 10-h.p. and 20-h.p., are shown by Messrs. W. Galloway and Co., Gateshead; near by the latest type of 15-h.p. White steamer can be examined at the stand of Messrs. Rennie and Prosser, Ltd., Glasgow, who also exhibit Fiat and Panhard cars. A varied display is made by Messrs. Wilfred Foulis, Ltd., Edinburgh, their exhibit comprising a Hotchkiss 40-50-h.p. six-cylinder chassis, a Vulcan 14-h.p. chassis, a Delage 10-h.p. chassis, and examples of the Porthos and Berliet cars, the latter including a cab exhibited for the first time in Great Britain. It is satisfactory to find the well-known Argyll cars again to the front. They are shown by Argylls, Edinburgh, Ltd., who stage examples of the 12-14-h.p., 14-16-h.p., and 40-h.p. models. A new car known as the "Alex" is displayed by Messrs. Alexander and Co., Edinburgh; it is fitted with a 16-18-h.p. engine having three systems of ignition. A standard Stewart-Thornycroft 5-ton steam wagon attracts attention at the stand of Messrs. D. Stewart and Co., Ltd., Glasgow. Other cars on view include the Adams, Albion, Alldays, Austin, Belsize, Chenard-Walker, Clement, Darracq, Dray, De Dion, Delaunay-Belleville, Ford, Gladiator, Hillman-Coatalen, Lancheater, Lorraine-Dietrich, Metallurgique, Halley, Minerva, N.E.C., New Pick, Porthos, Rapid, Renault, Rolls-Royce, Rothwell, Scot, Sizaire, S.P.A., Sunbeam, Swift, Thornycroft, Vauxhall, Werbell, and Westinghouse.

In the accessory section Messrs. Dunhills have their usual range of accessories, which include "everything but the motor." The County Chemical Company, Ltd., are well to the front with their "G.B." specialities, which range from grease and oil to carbide, sparking plugs and tyre repairing materials. Messrs. Avery and Roberts, Liverpool, show a full range of their well-known motor tools and also the new Tesama tyre, which has a puncture-proof tread consisting of two layers of fine steel wire incorporated in the tread. A new acetylene head light and generator known as the Carello, and for which numerous advantages are claimed, is exhibited by the Rapid Car Concessions, Ltd., Gloucester. Other accessory exhibitors include the Union Rubber and Chemical Company, Ltd. (Turco motor oils, tyre repairing material, vulcanizers, &c.); Messrs. H. M. Hobson, Ltd. (the Clandel carburettor); Messrs. Joseph Lucas, Ltd. (lamps); Messrs. Longstreths, Ltd. (Lithanode accumulators); and Messrs. Jas. Thomson and Son, Edinburgh (Blieriot lamps, Harvey Frost vulcanisers, Stepney wheels, Smith's speedometers, Pogonon sparking plugs, C.A.V. accumulators, Crypto transformers, Renold chains, Drummond lathes, &c.).

Among the tyres on view are the Kempshall, Calmon, Dunlop, Michelin, Shrewsbury and Challoner, Continental, Spencer-Moulton, and Clincher. The last named are made by the North British Rubber Company, Ltd., Edinburgh, whose latest introduction is the vacuum-grooved motor tyre, which is claimed to be a most effective non-skid. We hope to give an illustration of it in an early issue. Substitutes for pneumatic tyres are seen in the "Flexible Hub," shown by Smith's Flexible Hub, Ltd., and the Lynton resilient wheel of the Lynton Wheel and Tyre Syndicate, Ltd.

Lubricating oils are exhibited by Messrs. Easton and Melville, Ltd. (Ilo); Messrs. Peter Lee and Sons, Limited, Glasgow (Mobiline); Messrs. Moebius and Son, Stoke Newington, N. (Challenge); and Price's Patent Candle Company, Ltd.; the Anglo-American Oil Company, Ltd., keep their productions, "Pratt's Perfection" and "Taxibus" motor spirit, before the notice of visitors, as also do the British Petroleum Company, Ltd. ("Shell" Spirit) and the Gas Light Improvement Company, Ltd. (Carburine and Glico 760 motor spirit, lubricating oils, &c.).

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

ARGYLLS, LTD.—The new board of directors of Argylls, Ltd., of Alexandria, consists of Messrs. J. S. Matthews, managing director; Thomas Dence, London, chairman; John Anderson, Glasgow; R. M. Paterson, Paisley; J. Broadfoot, Glasgow; and Alfred Gausson, London.

THE UNIC MOTOR CAB COMPANY, LTD., has been registered with a capital of £30,000 and offices at 4 and 6, Copthall Avenue, London, E.C.

HUMBER (LTD.)—The report of the committee of investigation, appointed at the annual meeting, will be presented at the adjourned meeting, to be held at Birmingham on February 1st. In the revised reconstruction scheme the committee propose a capital of £653,000, made up of £340,000 six per cent. cumulative preference shares, and the remainder of ordinary shares. The preference shareholders in the present company are to be entitled to exchange three of their fully-paid shares for four in the new company at 16s. 6d. paid up, while the ordinary shareholders are offered one paid-up share at 15s. for each of the present fully-paid shares. The balance can be paid in two calls for preference and three for ordinary shares. The committee anticipate no difficulty in retaining the bank loan of £150,000. The straitened position of the company was due to great expenditure on the works.

STAR ENGINEERING COMPANY, LTD.—An extraordinary general meeting of the Star Cycle Company, Ltd., is being held at Wolverhampton on the 29th inst. to submit a resolution to the effect that the name of the company be changed to the Star Engineering Company, Ltd. The change is made desirable owing to the dominating importance of the motor department.

FRANK LITTLE AND CO., LTD.—This company has been registered with a capital of £7,000 to take over the business of motor and general engineers and garage proprietors carried on by Mr. Frank Little with Mr. F. W. Cawthorn as Frank Little and Co. The company is a private one with offices in College Avenue, Newcastle-on-Tyne.

An extraordinary general meeting of the shareholders of the Spare Motor Wheel of America, Ltd., was held at Birmingham on the 22nd inst. to consider the proposal to issue debentures for an amount not exceeding £30,000. The chairman, Mr. T. D. Crimmet Drayton, said that one of the reasons for the proposed issue was that the bank had asked for a reduction of the overdraft. The proposals were accepted by the meeting.

C. GRAHAME WHITE AND CO., LTD., is the title of a company registered with a capital of £100, and offices at 1, Albemarle Street, London, W.

THE CENTRAL MOTOR CAR AND CARRIAGE WORKS, LTD., has been registered, with offices at 131 to 135, Devonshire Street, Sheffield, the capital being £5,000 in £1 shares.

DUNLOP PNEUMATIC TYRE COMPANY, LTD.—A meeting has been called for Monday next to consider a resolution with regard to granting the Dunlop Rubber Company (Far East), Ltd., the exclusive right to manufacture in or import to Japan and other parts of Asia, motor tyres and rubber goods under the name Dunlop.

THE Pickering Crewdson Motor Company, Ltd., has been registered with a capital of £4,000 in £1 shares.

BENZ MOTORS (LTD.) has been registered as a limited liability company with a capital of £5,000.

THE Draycott Motor Company, Ltd., has been registered with a capital of £2,500 in £1 shares.

MESSRS. BELL AND SMART, LTD., is the title of a company registered with a capital of £2,000 in £1 shares at 48, Tottenham Street, London, W.C.

THE NAIL OF DESTINY.

For the want of a nail the shoe was lost,
For the want of a shoe the horse was lost,
For the want of the horse the rider was lost,
For the want of the rider the battle was lost,
For the want of the battle the kingdom was lost—
And all for the want of a horseshoe nail.

But this, my child, as you doubtless know,
Was a number of hundred years ago.

Brought down to date, the facts are these:
The general chooses to ride at least
In a new six-cylinder automobile,
And he punctures the tyre of his off-front wheel;
So the battle goes bump—not for the lack,
But because of a smallish carpet tack.—*Puck.*

LONDON TO EDINBURGH.

As illustrating the excellent organisation of the Automobile Association, we may mention that they got out for some trade members, who were making non-stop runs from London to Edinburgh in connection with the Exhibition, a detailed route *via* Doncaster and Berwick, with special remarks showing where caution was advisable and where loose stones might be expected on the roads. We reproduce this as likely to be of value to readers who may be going north or coming south at any time; the X indicating where caution is advisable.

Mileage.

- 0.—London, Whetstone (X), Barnet (X), Potters Bar (X.)
- 21.—Hatfield, Welwyn, Stevenage (road in good condition; no loose stones), Baldock (X.)
- 46.—Biggleswade, Eaton Socon, Buckden (X, special care Buckden, especially between the A.A. signs), Alconbury (X.)
- 69.—Alconbury Hill (X), Stilton (X), roads fairly good; loose stones in places, Norman Cross.
- 90.—Stamford (X), Great Casterton (X ten mile limit), good many loose stones in road, Witham (X), Colsterworth (X.)
- 110.—Grantham (X), Great Gonerby (X), Foston (X), Long Bennington (X.)
- 124.—Newark (X), drive slowly from the School House, Balderton, to Newark Railway Crossing, Tuxford.
- 144.—Retford (X), ten mile limit, Barnby Moor, Bawtry.
- 162.—Doncaster, drive carefully three miles north of Doncaster, bridge being built over road, Ferrybridge, Brotherton, Aberford.
- 193.—Wetherby (X, Thursday market day), Boroughbridge (few patches of stones here and there), Northallerton.
- 240.—Darlington.

The 12-h.p. Sizaire-Naudin Car, driven by Mr. A. Bray, leaving London for a non-stop run to Edinburgh.

- 258.—Durham (X), enter and leave town very carefully.
- 272.—Newcastle (X), enter and leave town very carefully; Stannington (X), Morpeth (X), Felton, Alnwick, Belford.
- 336.—Berwick (the Berwick to Edinburgh road has been in a bad condition owing to the recent heavy falls of snow, but should the present frost continue the roads will be hard and in good condition), Ayton, Dunbar, Haddington.
- 394.—Edinburgh.

WORLD'S MOTOR-CYCLING RECORD.

DESPITE the fact that he was unfortunate with his tyres, which caused him to stop on no fewer than six occasions, H. V. Colver made a successful attempt on the six hours' world's record at Canning Town on the 21st. Riding a 7-h.p. Matchless, he began his attempt at about 10 a.m., and in the first hour covered 47 miles 1,690 yards. An hour later he had traversed 96 miles 110 yards, but this was not fast enough to beat the record. However, his pace quickened, and at 141 miles he was inside record time. Tyre trouble at 144 miles put him outside record again, and it was not until he had ridden 231 miles that he again created new figures. From this point he beat all records up to the end of the six hours, when he had covered a distance of 270 miles 1,170 yards.

The previous record of 268 miles 285 yards was made on December 22nd, 1908, by O. C. Godfrey.

MR. ERNEST GOULD, who has been driving a Sizaire-Naudin car on a demonstration trip, is not the Mr. Ernest Gould who is managing director of the firm of Gould Bros., Ltd., Exeter—a confusion that has arisen in some quarters owing to the similarity of name.

CLUBS AND ASSOCIATIONS.

ROYAL.

ON the 20th inst. Col. N. Willoughby Wallace, C.M.S., read a paper on petrol and its dangers, in which he gave particulars of the conditions under which motor spirit can be stored, and referred to the Departmental Committee which the Home Office has appointed to deal with the matter. The paper concluded with the advocacy of a safety gauze device based on the Davy lamp principle for the safe conveyance of petrol.

MOTOR UNION.

THE General Committee of the Motor Union held its January meeting at the Hotel Great Central, London, over thirty representatives of the individual members and of affiliated clubs being present. The Finance Committee reported an increase in the receipts for 1908 of over £3 000; the committee also drew attention to the fact that nearly £5,000 was deposited with the Union by British and American members availing themselves of the facilities offered by the Motor Union under the triptyque system to those visiting the Continent.

The Signs and Notices Committee reported that in many cases the granting of a speed limit had been avoided by the Union supplying "special caution" signs, of which nearly 600 have now been issued.

The action of the Legal Cases and Reports Committee in supporting the appeal of a member in the now famous case of *Burton v. Nicholson* was approved, and in view of the importance of the question as to the side on which a motor-car should overtake a tram car the Parliamentary Committee was instructed to again press upon the Local Government Board the importance of amending the existing regulation.

Arrangements were discussed for the Official Tour and Provincial Meet in connection with the conference of the L.I.A.T., to be held in London next July at the invitation of the Motor Union. It was reported that the Borough Council of Swansea has voted a sum of money to the mayor for the entertainment of members of the Motor Union and the delegates to the Congress.

The Union has made an important extension in its touring facilities. After consultation with the Touring Club de France, it has appointed special Motor Union mechanics in fifteen of the chief towns of France, viz., Nantes, Caen, Rouen, Lille, Nancy, Orleans, Tours, Nice, Grenoble, Marseilles, Lyons, Bordeaux, Pau, Toulouse, and Clermont-Ferrand. This series of appointments is distinct from that of the Motor Union agents at the principal seaports, who make arrangements for the issue of driving licences and car permits. A list of these mechanics will in future be inserted in the form of a loose slip in the Motor Union Foreign Handbook.

COVENTRY MOTOR CLUB.

THE annual dinner of the Coventry Motor Club was held on Saturday, Colonel Wyley in the chair. Mr. H. W. Staner, proposing the toast of "The Club," said last year they had a successful year. He mentioned that, at the invitation of the Coventry club, the Royal A.C. were holding one of their two meetings of the year at Leamington, and he hoped some of the associates would go on to Coventry and see the factories. It seemed it would be a good thing to enlarge the local club and make it the Warwickshire Motor Club, Coventry being the largest centre in the county, save Birmingham, which, of course, was not wholly in Warwickshire.

Colonel Wyley, replying to the toast, approved of the suggestion to make the club a Warwickshire one, and in reference to the suggestion that magistrates and members of the County Council should be invited to join, said the latter authority were not concerned only with the question of speed, but also with the wear of roads, and were bound to make regulations. He believed no decent motorists ever exceeded the limit, and he advised them to have regard for the general public rights over the highways. He advised them, too, to agitate for tail lights being compulsory on vehicles, and mentioned his own close "shave" with a cart, owing to the latter having no rear light. Although the club of which he was president had a membership of 120, yet, considering the number of cars and motor-cycles which were on the Warwickshire roads, he thought they should be a much stronger organisation, and he favoured the proposal to expand its borders so as to include Warwickshire as a whole.

Following the presidential address came the presentation of prizes and of a gold watch to Mr. E. W. Walford, the hon. secretary, in appreciation of his work on behalf of the club.

The toast of "The prize donors and winners" was proposed by Mr. E. J. Hardy, Mr. G. H. Smith, Mr. J. Van Hooydonk, and Dr. O'Rafferty responding. The health of "The chairman" was in the hands of Mr. V. Riley, and the response of Col. Wyley brought the proceedings to a close.

SHEFFIELD AND DISTRICT.

THE annual general meeting of the Sheffield and District A.C. was held on Wednesday at the King's Head Hotel, Change Alley, Sheffield; when the committee's report was presented.

In this it was stated that the balance at the bank was now £103 and the membership had increased to 186. Reference was made to the various competitions and social events during the past year. The new

scheme of district honorary secretaries was reported to be working well, the club membership in the Rotherham, Doncaster and Worksop districts being greatly augmented in consequence.

The postal vote with regard to affiliation to a central association resulted as follows:—For the M.U., 61; for the R.A.C., 25; and in favour of neither, 6.

MANCHESTER.

THE annual general meeting of the Manchester A.C. was held on Monday, when the following were elected officers for the year:—President, Mr. A. E. Jones; vice-presidents, Messrs. T. W. Grace, J. A. Morris, and F. Smith; captain, Mr. S. Wallwork; hon. treasurer, Mr. J. Hoyle Smith. The committee were chosen as follows:—Messrs. A. E. Crowdy, E. A. Gadd, T. W. Grace, F. R. Hesse, G. B. Heywood, C. Lee, J. A. Morris, D. A. Parkyn, J. L. Tattersall, and T. M. Young.

NOTTINGHAMSHIRE.

At a meeting of the Nottinghamshire A.C., held at the headquarters on the 21st inst., Mr. C. Y. Knight gave a lecture upon the construction and merits of the new Daimler Silent Knight engine. Mr. W. P. Wells, a vice-president of the club, presided over a large attendance, and questions flowed freely at the end of the address. A hearty vote of thanks was given to Mr. Knight on the motion of Dr. T. Tresidder, seconded by Dr. Gray.

AUTO CYCLE UNION.

THE Auto Cycle Union's first quarterly trial for 1909 took place on the 20th inst., when no fewer than sixteen out of forty-two starters made non-stop runs. No tyre repairs were allowed—a fact which adds to the value of the performances. Those who went through without a halt were as follows:—G. E. Stanley, 3½-h.p. Premier; R. Walton, 3½-h.p. Norton; J. Marshall, 3½-h.p. Triumph; W. F. Newsome, 3½-h.p. Triumph; H. G. Potts, 6-h.p. Riley; W. H. Bashall, 6-7-h.p. Bat; J. T. Bashall, 3½-h.p. Triumph; A. G. Fenn, 7-h.p. Bat; R. C. Griesbach, 3½-h.p. Triumph; R. J. Bell, 3½-h.p. N.S.U.; W. Pratt, 3½-h.p. Phelon and Moore; F. Applebee, jun., 3½-h.p. Rex; T. Silver, 3½-h.p. Quadrant; R. Measures, 3½-h.p. Triumph; J. Stuart Shaw, driving O. von Saal's 6-8-h.p. Phonobile; and J. Portwine, 5-h.p. Auto-carrier's tri-car, the last two being in the passenger class.

SOCIETY OF AUTOMOBILE MECHANIC DRIVERS OF THE UNITED KINGDOM.

THIS society has inaugurated a Glasgow branch at a smoking concert held in the city of St. Mungo, with Sir J. H. A. Macdonald, the Lord Chief Justice-Clerk of Scotland, in the chair.

Sir John attended in his capacity as President of the Scottish A.C., and was accompanied by several other leading members of that organisation. He hoped to see a branch started in his own city of Edinburgh, and urged that the benefits of the society were of great importance to the men. He urged drivers to make the movement popular and not to take delight in annoying their fellow citizens. In town traffic they should be careful not to tear along the side of the road through slush and mud, doing damage to the dresses of pedestrians who were unfortunate enough to be passing at the time. He promised to do what he could to promote the interest of the society and hoped it would have good support.

Mr. G. T. Clark, the general secretary, said that many of the members of the Scottish A.C. had decided to draw their drivers from the society; this was already done in England by the Automobile Association. The society had supplied many drivers to manufacturers, and this he regarded as evidence that they were working along the right lines.

SOCIETY OF ROAD TRACTION ENGINEERS.

A MEETING of this society has been held, when the subject of Electric v. Gear Transmission for the motor-bus was discussed. Mr. P. Frost-Smith occupied the chair. The case for electric transmission was stated by Mr. Stevens, who adduced comparative figures as to the cost of running Messrs. Tilling's petrol-electric and petrol-gear-driven buses over some six months, the figures totalling 8-52d. and 10-106d. per mile respectively, and showing a saving of 1-586d. per mile in favour of the electric transmission. For the gear-drive an attempt was made to substitute 8½d. per mile working cost for the gear-driven vehicle, as more representative of modern practice, but this was contested by the chairman—whose connection with Messrs. Tilling is well known—on the ground that certain items were omitted. The vexed question of depreciation attracted some attention; the increased figure in the case of the petrol-electric bus was shown to be due to the heavier first cost—viz., some 25 per cent. more. But again this a longer life is practically assured, maintenance figuring at 0-82d. per mile as compared with 1-169d. per mile for the gear-driven vehicle.

MOTOR YACHT CLUB.

THE Motor Yacht Club has now sent a formal challenge for the British International Cup to the Motor Boat Club of America, and there is every reason to hope that at least one boat will be built in this country for the contest. Beyond the fact that the challenging boat must be constructed wholly in every particular in the country which it represents, the only

hull restriction imposed by the rules is that the overall length shall not exceed 39 ft. 11½ in. Practically any type of hull is therefore eligible, and it will be interesting to note what effect recent developments in the design of unrestricted racing boats will have on future Cup competitors. No limitation is placed on the form or description of the motive power, but every boat must be able to go astern at a speed of not less than four knots in still water.

AERO CLUB OF THE UNITED KINGDOM.

At a meeting of the Aero Club of the United Kingdom at the Royal A.C. on Tuesday night, M. Robert Esnault-Pelterie lectured on "Aviation," Mr. Roger Wallace, chairman of the Aero Club, presiding. Among those present were Viscount Royston, Professor Huntington, Colonel Massey, Major Baden-Powell, Major Lindsay Lloyd, and Messrs. Crawley, Waller, Lyons-Sampson, Frank Butler, and Harold E. Perriu, secretary of the club. M. Esnault-Pelterie traced the history of the science from the earliest days. He likened the principle whereby an aeroplane could be sustained in mid-air to a skater who passed safely over relatively thin ice because he went relatively fast, whereas once he stopped the ice broke and he would fall through. Investigators had to commence with learning how to balance machines before they could apply motor power to them in actual flight. Those who had attempted to fly before making such tests had their machines turn turtle. The principal question was not to leave the ground, but to maintain equilibrium once the machine was launched. In 1896 Lilienthal learned how to use wings for flights off a hill; and Pilcher, in England, with a horse-hauled machine of similar principle to Lilienthal's, also rose in the air; but both were killed by the aeroplanes overturning when soaring in gusty weather. Their deaths were followed by a period of seeming inactivity on the part of other investigators; but a few years after the Wright Brothers, who had followed Chanute's work with bi-planes, began soaring with bi-planes, on which they lay prone in the manner suggested hundreds of years ago by the painter Leonardo de Vinci.

AERIAL LEAGUE.

THE Aerial League of the British Empire is being formed, with offices in London. Already an influential number of enthusiastic aeronauts have consented to act as vice-presidents. The hon. secretaries, Colonel H. S. Massey, C.B., and Mr. Stephen A. Marples, are pioneering the movement, whose main object is to secure for the Empire the same supremacy in the air as it now enjoys on the sea, doing what the Navy League has done in respect to ships. "Everything British" is the key-note to be sounded, and an adjunct of the new propaganda will be the establishment of prizes for British-made aeroplanes and aero-motors, not forgetting rewards for British models. The provinces are furnishing several of the vice-presidents, and the list so far agreed upon includes Bishop Weldon (Dean of Manchester), the Bishop of Bristol, the Warden of Bradfield College, Lieutenant-Colonel Ivor Phillips, General Arbuthnot, Rear-Admiral Hon. T. S. Brand, the Prince of Kapurthala, Dr. W. H. Rouse (Cambridge), General Sir Harry Prendergast, Captain A. W. Gamlin, and General Cummins, C.B., D.S.O.

ON Tuesday the Cardiff M.C. held its annual meeting at the headquarters at the Queen's Hotel, Cardiff, when the secretary's report paid a tribute to the assistance rendered to the club by the Glamorgan county and city police when holding competitions. The annual dinner will take place on Wednesday next.

THE Lancashire A.C. held its annual dinner at the Park Hotel, Preston, on Saturday, and the yearly business meeting on the 28th inst.

FROM the ninth annual report of the Manchester A.C. it is evident that the club has had a useful season. The list of attendances of its committee is a proof of the interest that they take in its development.

THE Aerial League of the British Empire, of which Col. H. S. Massey and Mr. S. A. Marples are honorary secretaries, has offices at Staple Inn Buildings, London, W.C.

At the third annual dinner of the Essex Motor Club, held on Saturday, Mr. W. H. Bishop was in the chair, and Mr. J. H. Burley proposed the toast of the R.A.C. and affiliated clubs. Mr. J. W. Orde and Mr. F. Straight responded. The chairman proposed the toast of the Essex Motor Club and Mr. A. G. Reynolds made response.

THE annual general meeting of the Norfolk Automobile and Launch Club was held at the Royal Hotel, Norwich, under the chairmanship of Col. E. R. A. Kerrison, who was re-elected chairman of the club. Mr. E. J. Tench has been asked to act as honorary secretary for the present year.

CASES AGAINST MOTORISTS.

CHARGE OF MANSLAUGHTER—MOTORIST ACQUITTED.

At the Central Criminal Court the trial has been concluded of John Hesket Pearson, twenty-two, upon the indictment charging him with the manslaughter of Mr. James Talbot, who was knocked down and killed by a motor-car owned and driven by the defendant.

In summing up the evidence to the jury the Recorder said that the driver of a motor-car was in precisely the same position at common law as the driver of any other vehicle, and was bound to exercise due care and diligence, taking care that he was not guilty of culpable negligence. The question for the jury in this case was whether the defendant was

guilty of culpable negligence in not easing the speed of the car when he first saw Mr. Talbot, or in not going behind Mr. Talbot instead of in front of him. Nobody suggested that the defendant intended to kill Mr. Talbot, and, if there was any doubt in the case, the defendant ought to have the benefit of it. The jury, after considering their verdict for some time in private, found the defendant not guilty, the foreman adding, "We give the defendant the benefit of the doubt in the case." The Recorder, in directing the defendant's discharge, said to him:—"I hope the experience you have gone through will be a warning to you for the rest of your life, and that when you next drive along the King's highway you will do what your own witness said that he would have done in similar circumstances—namely, ease down."

WRONG PROCEEDINGS TAKEN BY THE POLICE.

At the Radcliffe Police Court, George White, of Manchester, was summoned for unlawfully using a locomotive which did not consume, as far as practicable, its own smoke. The evidence for the prosecution was that on December 11th the driver allowed smoke and vapour to be emitted from the engine for a quarter of a mile, to the annoyance of pedestrians and others using the road. After being stopped by a policeman the engine was restarted without any emission of smoke. Mr. Gordon Hewart, who represented the defendant and also the makers of the engine, Messrs. Foden, of Sandbach, called evidence to show that the engine was of the most modern construction, and that under normal conditions no smoke or steam could be emitted. Any such emission must have had a temporary or accidental cause. The driver said the fire got low while he was taking in water, and one result of the firing up was the emission of steam, but no smoke. The prosecution did not complain that the engine was not properly constructed, and Mr. Hewart asked for the case to be dismissed. The prosecution, however, said there was negligence on the part of the driver. Mr. Hewart replied that that was not the charge on the summons.

Mrs. E. Wetherby Williams, of Wides Court, Crownhill, Devon, at the wheel of her 20-h.p. Humber Car.

The magistrates' clerk agreed that under the Act by which the summons was taken out the driver could not be proceeded against for carelessness. The case was dismissed.

IMPRISONMENT.

At the London Sessions, on the 21st, Henry Bray, a motorist, was sent to prison for three months. He had been previously convicted. The accused was alleged to bear down upon two pedestrians crossing Goldhawk Road, at a speed between thirty and forty miles an hour, seriously injuring one of them. The prisoner stopped and returned to the scene, but then drove off. He was traced by the number on his car.

BATCHES.

At Barnet, on the 20th inst., three motorists were each fined £5 for exceeding the legal limit on the Great North Road; and at Kingston, on the same day, fines of £5 were inflicted upon some defendants who had exceeded the twenty miles limit on the Portsmouth road.

FLASH LIGHT SIGNALS.

The first prosecution in which the electric flash-light signal system was called in evidence against a motorist at Wimbledon was heard on the 20th inst., when a fine of £5 and costs was inflicted on a defendant summoned for exceeding the speed limit in Park Side.

DANGEROUS DRIVING.

At the Bow Street (London) police-court a motor-cab driver has been fined £20, with five guineas costs, for driving a motor-car in a manner dangerous to the public. Sir John Bell, Ex-Lord Mayor of London, gave evidence to the effect that he was run into by the defendant's cab, and the magistrate, Mr. Curtis Bennett, pointed out that it was not the law for a pedestrian to hurry out of the way merely because the driver of a motor vehicle sounded his hooter.

LIGHT LOCOMOTIVE.

In a case stated by the justices of Bridgend and heard last week in the Court of King's Bench, it appeared that the appellant had been convicted under Section 5 (1) (b) of the Locomotives Act, 1898 (61 and 62 Vic., c. 29), for not having three men in attendance on a locomotive, not being a steam roller, as in that section required. The locomotive in question was propelled by steam and weighed 4 tons 15 cwt.

Mr. Simon, K.C., submitted that the conviction was wrong, on the ground that the Act of 1898 had no application. By Section 17 (2) of that Act it was provided that nothing in the Act should apply to locomotives which were light locomotives within the Locomotives and Highways Act, 1896 (59 and 60 Vic., c. 36). Section 1 of the latter Act, besides laying down terms as to the construction and user which were not here material, defined a light locomotive as one whose weight unladen was less than three tons; so that if those statutes had stood alone the conviction would have been good. But the Motor Car Act of 1903 (3 Ed. VII., c. 36) provided by section 12 that the Local Government Board should have power by regulations made under the principal Act to increase the *maximum* weight allowed for a light locomotive, and the Local Government Board, by regulations issued in 1904, had substituted the weight of five tons unladen for three tons unladen, as provided in the Act of 1896, and the latter Act must therefore now be read with that amendment. The Locomotives Act of 1898, therefore, was now inapplicable where the locomotive weighed less than five tons, as was the case with the locomotive of the appellant.

The Lord Chief Justice said that when the sections were looked at chronologically they presented no difficulty. The provision in the Act of 1898 as to three persons being in charge did not apply to a motor-car in the ordinary sense, and by the 1896 Act a motor-car was made to include any vehicle weighing less than three tons. Later it was found desirable to alter the limit of weight, and the Local Government Board, acting under the power given them by the Act of 1903, made regulations which raised the permissible weight to five tons. It was true that in those regulations a distinction was drawn between light motor-cars which weighed less than two tons and heavy cars which exceeded that weight, but still all self-propelled vehicles, whether light or heavy motor-cars, were light locomotives if their weight did not exceed five tons. The locomotive in this case therefore came within the exemption, and the appeal must be allowed with costs. The other members of the Court agreed.

DISMISSAL WITH A CAUTION.

At the Boston Borough Police Court, Dr. Reginand Tuxford has been summoned for driving a motor-car in the High Street at a speed which was dangerous having regard to all the circumstances of the case. After hearing the evidence the magistrates consulted and the Mayor made their decision known in the following terms:—"We have been very much divided in this case. We know that if we convict you your licence will be endorsed, which will be a very disagreeable thing, and if it is endorsed more than once it may be withdrawn, at any rate for a time. There are two points in your favour. One is that we have only the evidence of the police that you were going at too great a speed. There is no evidence that any member of the public was inconvenienced at all, although they might have been. At the same time the Bench feel that the police ought not to wait until an accident does take place, and somebody is injured. It is the first case that has come before us, and it has been decided, with some hesitation, to dismiss it with a caution. If any other cases come before us they will not be so leniently dealt with. I hope you and all others, whether you drive a motor for business or pleasure, will remember that the convenience of the public comes before the convenience of the individual."

ROAD REPORTS.

LANCASHIRE.—Speaking at the London Institution upon County Council finance and audit, Mr. H. A. Windus, A.C.A., recently referred specially to the administration of Lancashire by its County Council. Motorists would be gratified to learn, he said, that in Lancashire, at all events, the fees collected under the Motor Car Act of 1903 were spent in the erection of signposts and dust-laying experiments.

WESTMINSTER.—The City Council of Westminster are pressing the Baker Street and Waterloo Railway Company to construct a subway for passengers from Trafalgar Square to the south side of Charing Cross.

GRINDLEFORD.—The road at the foot of the dangerous hill at Grindleford has been widened very considerably during the past year, towards which improvement the Sheffield A.C. contributed the sum of five guineas.

AYR.—The Ayr District Committee of the County Council has agreed to put up thirty direction posts for the convenience of those who use the roads throughout their district.

INVERNESS.—At a meeting of the Aird District Committee of Inverness it has been reported that motor-cars passed through the district about 12,000 times during the year. The average number of cars was forty per day on the main roads, and as many as 180 has been counted on some special occasions.

BRIDGEND (Glamorgan).—Mr. G. A. Phillips, Borough Surveyor, reports that the County Council has accepted tenders for widening and improving the following main roads:—The Caerphilly and Nelson road, between Caerphilly and Ystrad Mynach; the Cardiff and Pontypridd main road, between Nantgarw and Upper Boat. The Cardiff and Swansea main road is also being widened and diverted near Pyle. These works

are now in progress, but, as the roads are kept open for traffic, alternative routes are unnecessary.

BIRMINGHAM.—Lecturing to the Birmingham University, Mr. H. E. Stilgoe, the City Engineer and Surveyor, a few evenings ago, said, as an escape from the dust nuisance, they had been tar-spraying their macadam roads. The cost of giving two coats of tar was about 2d. per square yard. During last summer they sprayed about seventy-five miles of streets with very beneficial results, people living alongside the roads finding the method a great comfort. An incidental advantage was that after roads had been treated in this way there was much less mud to remove. The saving made in this way, not only in cartage, but in the increased life of the road, more than met the expenditure of 2d. per square yard.

GLOSSOP.—The L.G.B. have declined to grant the application of the Glossop Town Council for a ten mile limit for motor-cars travelling over the principal roads of the borough.

FORTHCOMING EVENTS.

JANUARY.

30th (S.).—Annual Dinner of the Auto-Cycle Club.

FEBRUARY.

2nd (T.).—Annual Dinner of the Scottish A.C. at Glasgow. H.S.H. Prince Francis of Teck will be among the guests of the club.

4th (Th.).—Annual Dinner of the Southern Motor Club.

5th (F.).—Annual dinner of the northern members of the A.A. at the Midland Hotel, Manchester.

19th-27th.—Manchester Motor Show at Belle Vue.

17th (W.).—Paper on Lubrication by Mr. J. W. G. Brooker at the R.A.C.

20th (S.).—First Annual Dinner of the Sutton Coldfield A.C. at the Royal Hotel, Sutton Coldfield.

24th (W.).—Annual General Meeting of the British Motor Boat Club.

MARCH.

1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.

Motor-Car Show at Barcelona.

Last day for entries for Monaco Aeroplane Competition.

6th (S.).—Cambridge University Motor-Cycle Club Reliability and Petrol Consumption Trial.

20th-27th.—Cordingley's 14th Annual Motor-Car Exhibition and Market, Agricultural Hall, London.

MAY.

2nd (S.).—Targa Florio, Sicily.

14th (F.).—British Motor Boat Club meeting at Erith.

24th-29th.—Irish Reliability Trials—provisional date.

JUNE.

10th-18th.—Prince Henry Trophy Competition.

14th (M.).—Commencement of the Scottish Reliability Trial.

22nd-26th.—Royal Agricultural Show at Gloucester.

JULY.

5th-10th.—Auto-Cycle Union's Six Days' Trial.

LIGHTING-UP TIME—LONDON.

BUSINESS NEWS.

MR. E. H. BOLTON, who has been connected with Messrs. Clement-Talbot, Ltd., for some years past, has taken over the management of Messrs. Dawfield, Ltd., automobile repairers, of 274A, Uxbridge Road, Ealing, W. The company have a well-equipped plant for the carrying out of moto-car repairs of all kinds.

ON Thursday of last week a fire broke out on the building occupied by the Anglo-American Motor-car Company in He don Street, Regent Street, London, W. The showrooms were practically wrecked and the appearance of several new Cadillac cars sadly affected. With characteristic promptness, however, Mr. F. S. Bennett had the place ready for business again by 10 a.m. on the following day.

WE are asked to state that the telephone number of "Vico," Ltd., of 90, Charing Cross Road, London, W.C., is 2918 City.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, FEBRUARY 6, 1909.

[No. 518.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

Motor-cars and Military Service.

WE understand that the Automobile Association has suggested a scheme for the use of motor-cars for transport purposes, which, it is hoped, will be found acceptable to the War Office. The full details are not yet to be published, but the general idea is that the members of the A.A. should place their cars at the disposal of the War Office in any manoeuvres which may be planned for defensive purposes. It is hoped that the War Office may be able to co-operate with the Association in this scheme, and there is reason to believe that the authorities are not averse to the idea. A brigade of motor-cyclists is also to be placed at the disposal of Mr. Haldane, the Auto-Cycle Union having the matter in hand. It is estimated that large battalions of riders of motor-cycles could be raised on the coasts ready for any emergency. Although motor-cyclists might not become actual combatants, they could be extremely useful in conveying messages, scouting and rapid riding generally.

Passing Trams in the Metropolitan Area.

FOLLOWING the opinions of the Chief Constables of leading towns with regard to the passing of tramcars by motorists which we were able to publish in our last issue, we have now been informed by the Commissioner of Police of the Metropolis that he has no power to issue any general directions on the subject, and that in the London area "police action must necessarily be determined by the particular circumstances of each individual case of irregularity which comes to their notice." This seems a satisfactory interpretation of the position by Sir Edward Henry, who is evidently with the Lord Chief Justice in recognising the law as now laid down is really an impossibility if the public is to be protected.

Cattle on the Highway.

MUCH has been heard recently of the danger of cattle on the highway, and the Coventry Motor Club is suggesting to the Warwickshire County Council the advisability of taking action with a view to securing the adoption of a bye-law rendering it imperative that drivers should carry a lighted lamp when in charge of animals on the public roads at night. Particular point is given to the suggestion by the experience of a party of motorists between Derby and Burton early on Saturday last. Mr. R. Peach was driving when, ahead of him, he discerned a herd of cattle leisurely crossing the highway, evidently making from one field to another. Reducing speed and carefully manoeuvring his way, the motorist drove very carefully and was nearly past the animals when one of them charged the car, disabling the radiator with its horns. The party were several miles from a town and were completely stranded. Fortunately a Burton doctor, happening to pass shortly afterwards, was able, on reaching his destination, to despatch another vehicle to bring home the stranded motorists. Instances such as these, which probably our readers could duplicate, should considerably assist the movement now proceeding to secure that those in charge of animals being driven at night time on the highways should give passing traffic some indication of their presence.

Where Garages are Wanted.

SEVERAL correspondents have lately written for information as to suitable places in which to open motor garages or motor repair establishments. So much depends upon local circumstances, as well as upon the amount of motor traffic through the town, that great care should be exercised in advising the establishment of any further motor repair facilities in many places. At the same time there must be several towns where there is yet room for a really smart and well-equipped establishment, the proprietor of which is prepared to give practically his whole time to the interests of motorists passing at any hour of the day and some during the night. In our advertisement columns many opportunities for success in this direction have lately been made known, and those who are interested in changing their present location or commencing in new spheres of enterprise are advised to consult these columns from time to time.

Maps.

MOTORISTS, as much as any other section of the community, are interested in the work of the Ordnance Survey, which is responsible for the provision of topographical maps for this country. The work of the Survey practically began in 1784, and a few years later Parliament ordered the survey of the whole of the country. In 1858 new scales were settled as follows:—(a) 1-500, or 10·56 ft. to the mile, for towns of over 4,000 inhabitants; (b) 1-2,500, or 25·344 in. to the mile, for all except uncultivated areas; (c) 6 in. to the mile; and (d) 1 in. to the mile. These scales had been adhered to ever since, and, with the exception of the 1-500, were periodically revised. The face of the country was constantly altering from artificial and natural causes. The Treasury, therefore, sanctioned, in 1886, a revision of the 1-2,500 scale maps every twenty years, but the work could not be begun until 1894. In Great Britain the original survey was completed towards the end of last century, and the work of the Ordnance Survey is now that of periodical revision of the maps. That, in spite of every precaution, some errors occurred can not be denied, but, when it is remembered that the Ordnance Survey publishes between 90,000 and 100,000 different maps, Col. Sir Duncan Johnston, the late Director-General of the Survey, believes that the errors are comparatively trifling.

The Taxicab in China.

WHILE tracing in the dynastic histories of China the numerous allusions to a curious chariot in which there was an arrangement for registering the distances traversed, strongly suggestive of the modern taxicab, Dr. Giles, Professor of Chinese at Cambridge University, has recently unearthed a complete specification of its mechanism, according to which it is quite possible to reconstruct such a vehicle. It appears that these taxicabs, to use a convenient term, were first mentioned under the Chin dynasty (A.D. 265-419), and from that time down to the middle of the fourteenth century frequent allusions to such vehicles, known as "measure-mile-drum-chariots," are to be found in the dynastic histories. Under the year 1027 A.D., and again under the year 1107 A.D., full particulars are given as to their construction, the number of wheels, their positions, the number of cogs on

each wheel, &c., being all definitely stated. On completing a translation of the specification, Professor Giles placed it in the hands of Professor Hopkinson, of the Engineering Laboratory, with the satisfactory result that, from a specification recorded by the Chinese some 900 years ago, Professor Hopkinson has constructed a model of a wheeled vehicle which accurately registers the distances traversed. At each li, or Chinese mile, which is about one-third of an English mile, a drum is struck, while at every tenth li a bell is rung.

The Cost of Aeronautical Engines.

WHILE we fully recognise that the production of a petrol engine specially designed for aeronautical purposes must be a much more costly matter than usual, owing to the great attention that has to be paid to secure maximum strength and reliability combined with lightness, we are afraid that the makers are closely following the plan adopted by motor-car manufacturers in the early days of the automobile movement by asking almost a prohibitive price for their productions. For example, the Pipe 50-h.p. motor, of which we have lately published a description, is listed at £600, the Gnome Company quote £400 for a 50-h.p.

A French suggestion for Aviators who find the present price of Engines too high. (L'Aero.)

engine, and £720 for one of 100-h.p., an Antoinette sixteen-cylinder motor developing 50-h.p. costs £660, and one of 100-h.p. £940. Finally the Dutheil-Chalmers motor costs £440 in the case of the 60-h.p. type, and £720 for the 100-h.p.

From 1s. upwards.

AN advertisement, for the insertion of which we now charge nothing, is appearing in the general Press to the effect that "The evils inflicted by the misuse of motor vehicles continue unabated, in spite of the Local Government Board's circular and the disciplinary measures taken by automobile societies. The existing law has proved inadequate to check offenders and there is no prospect of relief until it is amended. A Central Committee has been formed to press this question on the Legislature and to formulate reasonable measures required for the better protection of the public. The Committee includes members of the House of Lords and the House of Commons, delegates appointed by 135 Local Authorities, the Highways Protection League, and the Road Union. The Road Union has undertaken the task of carrying on this organisation, and those who wish to get something practical done can best promote that end by supporting it. Contributions received from one shilling upwards. Address The Secretary of

the Road Union, 47, Victoria Street, S.W." So that for one shilling a man can become a member of the Road Union and feel a national pride when he reads its fulminations against motors and motorists which periodically appear in the Press. We should like to hear from the secretary as to the definite proposals which his Union intends to make, so that we may know exactly how the matter stands. The motorist, equally with the reasonable person who does not own a car, is anxious that the public should be safe on the public roads, and, if the suggestions are really valuable, he, too, might become associated with the Road Union. Meanwhile, however, we await the exact programme.

Organising Motorists.

APPARENTLY the work of organising local centres of the M.U. is proceeding as merrily as is the affiliation of existing clubs to the R.A.C.—a state of things which proves that there is considerable expansion in the motoring community. Otherwise such activity on the part of both organisations would be impossible. At Newark a strong branch of the Union is being formed, and the Lord Bishop of Southwell is lending the weight of his authority to the movement. Meanwhile the R.A.C. reports new adhesions to its scheme. The A.A., too, which, save for its Manchester and Glasgow branches, does not develop local centres, is also gaining members, its methods proving attractive to a great many motorists otherwise unidentified with any organisation.

Motorists as Considerate Drivers.

ALTHOUGH no resolution was adopted at the annual meeting of the Monmouth Chamber of Agriculture at Newport on Saturday, it was evident that the position of the Standing Joint Committee in dealing with the resolution on the subject of motor-cars which the Chamber had previously passed was not welcomed by the members. Several speakers urged that the police should be given emphatic instructions with regard to speed, and the chairman, Mr. R. W. Williams, of Pontypool, confessed that he always feared being made "a box of cold meat" when he went outside his house. Fortunately, Mr. Chas. D. Phillips, who is himself a motorist, was present, and did something to tame the wild assertions of the speakers. He pointed out that an automobile club had been formed for the county, and its main object was the suppression of dangerous practices. Further, he urged that the principal point with which they should concern themselves was the efficiency of motor-car drivers, a matter which is not considered in the present system.

Easter at Brooklands.

AT the Easter meeting of the Brooklands Automobile Racing Club there will be twelve races for cars and four events for motor-cycles. The contests will be over 3 or 5½ miles, and the programme is extremely varied, in accordance with suggestions that have been made from time to time for the popularisation of the track as a sporting rendezvous. The Brooklands Four-Inch Race will be for cars of R.A.C. rating of 25.6-h.p. or under, with no restrictions as to weight; the Limited Four-inch Race will be for vehicles with engines of similar rating to the Brooklands, but with a maximum weight of 2,200 lbs., the minimum being 1,800 lbs. Three cups will be competed for, that known as the Weybridge, limited to cars propelled by engines of R.A.C. rating of 37-h.p., or under, the stroke of which does not exceed 141 mm.; the Southern Cup is limited to engines with a rating of 42-h.p., with a stroke not exceeding 151 mm. A similar limitation of stroke with engines of 60-h.p. or under is made for the Carlton Cup. In the Easter Senior and Junior Handicaps cars of over and under 25-h.p. will run, the distance for the former being 5½ miles and for the latter three miles. Two events are restricted to private competitors, the senior and junior handicaps on similar bases to those just enumerated. An obstacle race, in which a number of figures will be drawn across the course, is also in the programme, as well as a tyre change race for cars fitted

with detachable wheels or removable rims. The motor-cycle events will each be over a distance of five miles, the winner in each case to receive fifteen sovereigns, the second seven sovereigns, and the third three sovereigns. Entries for all these classes close on March 30th, and unless there are ten entrants in the car categories the Executive Committee may declare the races void. A limit of twenty-five entries is placed on the motor-cycle classes. On another page we give a synopsis of the regulations that have been made with regard to the contests.

Instruction in Driving.

A thoroughly practical course is arranged, and the instruction is taken either on a club car or on one provided by the member concerned. Lessons on technical details can also be arranged. In

WHILE the R.A.C. is occasionally adding recognised motor schools to its list of establishments to which prospective motorists may be recommended to go for instruction, it also undertakes automobile tuition on its own account.

roads in Victoria itself are not very creditable, being inferior to those of the surrounding country. The number of cars in this community is increasing rapidly, and the new vehicles being bought are mostly of large size and superior make. The latest addition is the Lieutenant-Governor's new 40-h.p. Fiat landaulet, which is one of the finest cars in the province.

Watching the Press.

THE Automobile Association continues its work of following up the reports of alleged motor-car accidents which are not really attributable to the automobile, as they are made to appear in the daily papers. Keeping pace with these inaccuracies is a work which will tax the energies of Mr. Stenson Cooke to the utmost. At the same time he is performing a useful service to the motoring community, and we hope our friends of the general Press will at least give equal publicity to the corrections as they do to the false reports which are so frequently issued. Whenever a cart collides with a car the heading is "Motor-car Accident," and should an automobile

Motor Touring in Egypt.—An everyday scene on one of the bridges over the Nile.

1906 pupils to the number of 637 received lessons, and in 1907 the number rose to 763, whilst in the year that has just ended 918 underwent the course. The club car was driven 6,000 miles during 1908 without the slightest accident—quite as great a tribute to the car—a Star—as to the method of tuition provided.

Motoring in British Columbia.

This certainly speaks volumes for the British Columbia climate. Not only is the climate mild, but the roads, especially on Vancouver Island, are exceedingly good. Up to the present time the greatest difficulty has been in the absence of a good road to connect the north and south sections of the island. The Provincial Government is, however, at present engaged in making a new road from Goldstream to Mill Bay, which will open up 400 miles of beautiful roads in the upper island to motorists in the south. The

A CORRESPONDENT in Victoria, B.C., writes that cars can be quite comfortably operated here in the winter months is abundantly evidenced by the fact that the Victoria Motor Club purpose holding their annual club run on Christmas Day.

encounter anyone who rushes heedlessly across the road a whole column of vituperation appears against the vehicle that may be quietly pursuing its way. The work of the A.A. may have a corrective effect. On another page is an exhaustive return showing that of a total of thirty-eight fatalities from accidents in which the motor-vehicle was more or less directly concerned during ten weeks, in no fewer than twenty-eight cases the drivers of the cars involved in the accidents have been completely exonerated by juries. In only three cases have the drivers been committed for trial, which, as has been proved in previous motor-cases, does not necessarily mean guilty.

A NUMBER of wealthy mining men at Goldfield, Nevada, U.S.A., are pushing forward their plans to make their city a centre of automobile sport. With a view to holding a grand series of races they have secured a large area out on the desert, about twelve miles from Goldfield, where a circular track, fifteen miles in circumference, has been defined. The locality is stated to be a dry lakebed of great extent, level as a floor and hardened by centuries of baking under the sun.

Our Prize Story.

THE COMET OF PUDDLEHAMPTON.

By T. CRAVEN JOHNSON.

THE village of Puddlehampton was not behind other villages in the matter of small talk to vary the monotony of an otherwise uneventful career. Nay, it had a somewhat bigger share than most hamlets of its size, and had it not been kept busy for the last six months with what, to these simple folk, was quite a sensation?

Seven months back the great deserted Grange, standing in its wild, neglected grounds, was an object to be shunned. It had been unoccupied for many years, and the course of time had not dealt kindly with it.

To the great majority of the villagers this derelict relic of the days gone by inspired a feeling of something that was more than awe, and he would have been considered a bold man who had ventured alone along that road after darkness had set in. In the village inn, when conversation lagged, the men would draw their chairs closer together, and with stern set faces listen while one or another would tell in whispered tones of strange things he

When Puddlehampton had recovered from its first gasp of astonishment that any should make so bold as to inhabit this spirit-infested abode, it naturally looked to see some great alteration in the outward appearance of the house. But here was, perhaps, the greatest surprise at all. The Grange remained unaltered. The paths were still grass-grown, the windows broken, doors and gates unhinged, and a general air of utter desolation. In spite of this, the great motor came and went, bringing the strangest cargoes the villagers had ever seen. They had looked for personal luggage, but, instead, were crates of thin sheet metal, or pieces of weird-looking machinery, or long lengths of drawn steel tube, and numberless boxes, the contents of which could not even be guessed.

As, day after day, and often half through the night, strange sounds of hammering and sawing and the rattle of machines went on, speculation in the village ran high.

Who could the strangers be? What meant all this unusual noise and hustle, and to what use could all this strange machinery be put? Naturally superstitious, the simple folk of Puddlehampton, who had always fancied some evil influence held sway in the old Grange, were now dead certain of the fact. None but those whom the Devil favoured would have dared, in the first place, to take up their abode in a spot that was associated with nothing but evil, and, say what you will, these strange noises and doings boded no good for the neighbourhood, or for the authors of them.

Of these latter next to nothing was known. They seldom passed directly through the village, and then said never a word. No one knew their names or where they came from. One thing was certain, and this was settled nightly in the village inn, the presence of the men would, sooner or later, bring some great disaster to them all, and many were the plans and suggestions that were made to avert the danger when it should come upon them. But there was one flaw in all their arguments. None had any clear idea as to what the danger was he so much feared.

So Puddlehampton lived its life. For six months the village had been in a state of excitement and unrest. The women gossiped daily at their cottage doors, and the men went to and fro from their work, spending their evenings, as usual, in the inn; but over all there was a strange sense of depression, as of impending doom.

Now, at the time with which our story is most concerned, there happened an event that stirred Puddlehampton to its very core. A sensation so startling that even the strange doings at the Grange were completely forgotten for the time.

The villagers were, as usual, seated in the parlour of the inn, when, suddenly, one of the weirdest, wildest, strangest sounds that ever fell on mortal ears was heard. Mugs were at once put down; pipes withdrawn; and a look of blank astonishment overspread the faces of all.

Now the Puddlehamptonians, good and worthy souls though they be, are not renowned for quickness of thought, and it was some time before they fully realised the import of this great commotion. When they did, be it said to their credit, they were quick to move, and, to a man, rushed helter-skelter for the door. They were met by poor George Green, the half-witted youth of the village, who, with hair on end and eyes protruding from their sockets, was running wildly towards them shouting: "Look! Look at the moon! It's flying about!" And, sure enough, there, in the sky, was a great light slowly moving through the air, and the sound produced by the object in its flight was so unearthly as quite to baffle description.

Consternation spread throughout the village, and from all directions came men, women, and children, stumbling and falling in their eagerness to join the crowd on the green.

The Confidences of the Villagers.

"In the village inn, when conversation lagged the men would draw their chairs closer together, and with stern set faces listen while one or another would tell in whispered tones strange things he had heard or imagined he had seen."

had heard, or imagined he had seen—the spirit forms that glided to and fro—unearthly sounds that issued in the dead of night—all due, it was said, to the wicked life of its last owner, one Sir Geoffrey Strangeways, who departed this life just 103 years ago come Michaelmas. If this had been all, there would have been nothing to single out Puddlehampton from among the many rural hamlets with which our land abounds. It would have remained just an ordinary, slow-going community, with just the ordinary tittle-tattle and petty scandal.

But a great event had happened! So great, that the whole neighbourhood seemed paralyzed with astonishment and excitement when the news came out. *There were tenants at the Grange.*

Old Joe Bellamy had seen them with his own eyes, and "might the Almighty strike him dead if he didn't speak the truth."

There could be no denying the truth, for others soon had glimpses of the new arrivals.

A great motor-car had come tearing along the quiet old roads and made its way up to the broken-down gateways of the deserted house, and the doors had creaked on their rusty hinges and admitted the strangers to the uninviting rooms.

Our Prize Short Story—continued.

Every cottage was soon deserted. Not a soul would stay alone under the shelter of a roof when any moment might be the last.

The pale, drawn faces of the women, and the piteous cries of the children, clinging to their mothers' skirts, touched the rough hearts of the men, and the common fear drew them close together.

There, in family groups, they stood silently watching and waiting. Waiting for they knew not what. Watching the great light as it moved above them. On and on it went until it hovered over the farthest limit of the village, the intense brightness dazzling their eyes; the dreadful sound vibrating in their ears, and setting their teeth on edge.

Then! Could they believe their eyes! The object turned and slowly made its way back again. Three times it encircled the village, and then was lost to view behind the wood. Gradually the sound diminished, and finally ceased, leaving a stillness that was almost more fearsome than the recent din.

It is a harrowing sight to see strong men cowed with fear. To see women and children, stiff with fright, placing their trembling hands over eyes that refused even the consolation of tears. We would gladly draw the veil over the scenes of that terrible night. Suffice it to say that no attempt was made at sleep, but all, in the quiet of their homes, spent those hours of darkness as men who know their doom is near. And it would be sacrilege on our part to seek to know the thoughts, or hear the words that passed among them.

As the dawn dispelled the darkness, something of the confidence that daylight brings began to return to most. Then, for the first time, the desire to know something of the cause of all their fear began to make itself felt.

One by one they straggled out into the bright morning air, and, gathering in little groups, stood around their cottage doors, each trying to hide the sense of fear that still lurked in their breasts.

Search the village as you might, you would only have found one to whom this strange phenomenon had brought no feeling of dread, and that was the poor half-witted boy. True, he was even more excited than the rest, but his excitement was due to the fact that he had seen something quite unusual, the novelty of which appealed to his undeveloped mind.

Eagerly he pressed his questions:—

"Tell me, why did the moon fly round?"

"Hush, lad, 'twasn't the moon. There was no moon last night."

"But I saw it! I saw it! What made it make that noise?"

he persisted; but they were used to his questions and let him ramble on unnoticed.

"I've been thinking," said the innkeeper, "and have come to the conclusion that what we saw last night was nothing more or less than a comet."

"Yes," he continued, seeing the eager faces turned towards him, "a comet. You know, a kind of big star that flies through the air. Sometimes they have a tail of fire; and sometimes they—Well there! There's no accounting for what comets do."

This lucid explanation seemed to impress the village folk, who held the innkeeper in high esteem. He had travelled somewhat in his time, and his knowledge of the world was a constant source of wonder to these trusting souls, who did not know enough themselves to be able to doubt the truth of all the wonderful tales he told.

As soon as the village had fully agreed that their visitant of the previous night could be nothing but a comet, they were all agog with wild excitement. Now that the danger was passed—at any rate for the time being—tongues vied with one another in discussing this epoch-making event.

Not only had Puddlehampton witnessed a phenomenon that is denied to many a generation, but the heavens had singled out this one spot, above all others, over which to make its display. The comet had not only passed over Puddlehampton, but it had turned and circled around it three times, as though loth to leave so charming a place, or wander farther into the cold world.

The great news spread rapidly throughout the whole district. Puddlehampton had seen a real comet! Everybody had seen it!

A great star, as big as the moon, that went round and round the village. A star, whose light was so bright that their eyes were dazzled! And that made the weirdest, strangest sound that anyone had ever heard!

All day long crowds of people kept pouring into Puddlehampton, eagerly questioning the villagers for details of the great event. In all its long and brilliant career Puddlehampton had never been so crowded, and the villagers were filled with pride at suddenly finding themselves famous. Each time the story was repeated some new detail crept in, until it was borne home upon the neighbours that a more gallant, daring and heroic people never existed than the watchers on the green the previous night.

Towards evening the excitement was immense.

Would the comet reappear!

Eagerly they waited, straining their eyes to catch the faintest gleam of light; straining their ears that even the slightest sound should not escape them. But all in vain. The

The Mysterious Cargoes.

"They had looked for personal luggage, but instead were crates of thin sheet-metal or pieces of weird-looking machinery, or long lengths of drawn steel tubes, and numberless boxes, the contents of which could not even be guessed."

comet did not come that night, and so the expectant neighbours slowly made their way, disappointed, to their homes.

* * * * *

A week passed and no further sign of the comet had appeared.

Puddlehampton was beginning to settle calmly down again to its ordinary life; proud that so important a thing as a comet had singled them out for special favour, but heartily glad that it had not continued to thrust its patronage upon them.

This thankful spirit, however, was of no avail, for that very night the darkness was rent with cries of anguish.

"The comet! The comet is coming!"

In wild confusion men, women, and children rushed out from their homes. There, sure enough, was the dreaded object.

"It's coming straight for the village. Now it's over Gregory's field. Now it's . . ."

Bang!

A blinding flash. A terrific explosion. A rattling, tearing, clanging, snapping sound. A dull thud, and then—a silence as of death.

Paralysed with fear, the watchers stared at one another in blank amazement. Their tongues refused them utterance, and

Our Prize Short Story—continued.

their hearts were throbbing wildly. As, however, some time elapsed and nothing further had occurred, a sense of great relief came over all, and, with but little discussion, they wended their way back to their homes.

There was no desire to investigate further while darkness lasted, but as soon as daylight came a small group of the more venturesome members of the community made their way towards Farmer Gregory's field.

On reaching their destination, a surprise greater than they had anticipated awaited them. Instead of a mass of molten earth, as they had expected, was a quantity of wreckage of some great machine scattered about the field. Pieces of metal framework, steel tubing and rods, parts of an engine, and cog wheels, and a big electric searchlight were all cast about in utter confusion. Farther along they came to what appeared to be huge silken wings, and, underneath, the dead and mangled bodies of the strangers from the Grange.

Slowly the true meaning of it all dawned upon them. "The six months of mystery at the deserted house had been the preparation of this mechanical monster, that had cost its makers their lives just as they thought success to have been achieved.

Little had these two known the consternation they were causing in the hearts of the simple folk of Puddlehampton, and if they had been told that their flying machine would be mistaken for a comet they would have laughed outright.

But now they were beyond the power of human emotions, and does it not seem a significant fact, what they had been unable to do in life, death had accomplished?

Their souls, being freed from the encumbering moulds of clay, had taken flight into the great unknown.

CARBON DEPOSITS IN PETROL MOTORS.

THE carbonisation of piston heads and the surfaces of the combustion spaces of petrol motors is a condition which is generally regarded as inevitable after extensive service. The average motorist is fully aware that his engine, while in use, is gradually accumulating carbon incrustations, and probably in some cases attributes to carbonisation operative defects which are due to other causes. Nevertheless, a deal of trouble is occasioned by these deposits, the presence of which is recognisable by well-known symptoms. As with most other evils which afflict petrol motors methods of prevention and of cure are both desirable of application. The avoidance of too rich or imperfectly gasified fuel mixtures and the employment of a not excessive quantity of a grade of lubricating oil which is as free as possible from a tendency to produce solid residue are obvious preventives.

Notwithstanding all preventive measures deposits will form in the course of time, and the method of their removal may be either mechanical or "chemical." Scraping out the deposits is a perfectly sure method, but if thoroughly done involves the taking down of the motor and a considerable amount of hard work. The majority of motorists utilize the so-called chemical method by occasionally treating the cylinders with paraffin, which seems to keep down the incrustations to a considerable extent. Scraping is, as a rule, finally resorted to after a long period of service. Quite recently there have appeared upon the market compounds known as "decarbonizers," which, when applied to the combustion spaces of a motor, are claimed to remove all accumulations from the metallic surfaces by a purely solvent action, often described as "chemical." Experience has shown that some, at least, of these decarbonizers possess decided merit, and that they do cause the breaking up and separation of carbon accumulations and lead to their expulsion from the cylinders, leaving the parts in a relatively clean condition.

M. BRISAUD, writing to one of our French contemporaries, states that he is the inventor of an aeroplane with which he means to fly to the North Pole in 1910, and that he is anxious to find a partner to finance the undertaking.

CONTINENTAL NOTES.

A Hill-climbing Competition near Toulon.

The Automobile Club of Toulon is organising a hill-climbing competition at Bornes for the 28th inst. Categories will be provided for cars ranging from single-cylinder up to six-cylinder vehicles; nine cars—three each Rochet-Schneider, Cottin-Desgouttes and La Buire—have already been entered.

Public Services in France.

A public service of motor vehicles, consisting of two 40-h.p. ten-seated Peugeot cars, has just been established between Grasse and Thorenc, in the South of France. A Lorraine-Dietrich covered char-a-banc is also making a daily trip between Nice and Peira-Cava.

Motor Cars in Spain.

According to a recent report there are now about 3,000 motor-cars in use in Spain. Madrid is credited with 500, Barcelona and district with 600, the province of Guipuzcoa with 300, and the province of Vizcaya with 300.

Motor-cabs in Berlin.

A somewhat startling item of news reaches us from Berlin. It is to the effect that the police authorities have just issued a notice that no more taxi-cabs fitted with petrol engines will be licensed; the order, if insisted upon, will have serious results, as a large number of cabs are still on order in respect of which deposits have been made.

An Italian Road Race Cancelled.

It has been decided to postpone the motor-race meeting at Bologna, Italy, until 1910. Last year the meeting was one of the principal fixtures of the Italian season as regards long distance road racing. In its place it is proposed to organise contests for aeroplanes in conjunction with the Brescia Circuit Committee, prizes to the value of £4,000 being offered.

A Motor-cycle Volunteer Corps in Germany.

Arrangements have now been completed between the Prussian Ministry of War and the Association of German Motor Cyclists for the establishment of a Volunteer Motor Cycle Corps. Members will be expected to put in a certain number of attendances during the year for military instruction, and, in the case of mobilisation, to immediately report themselves to the headquarters in Berlin.

Motoring in Tunis.

The automobile movement is making excellent progress in Tunis. While in 1905 there were only about a dozen cars in the country, the latest returns show that there are now over 210 vehicles registered, the majority being of French construction. The traffic regulations are the same as those that are in force in Algeria and France; on the open roads a speed of twenty kilometres per hour is allowed, this having to be reduced to twelve kilometres when passing through villages. At present Tunis, unlike Algeria, has no automobile club, but a number of enthusiasts are considering the question of organising one or two sporting events during the coming season.

An Austrian Motor Sleigh.

A feature of the recent meeting at Chamonix, organised by the Touring Club de France, was the trial of a number of motor-propelled sleighs. The subject is one which is engaging the attention of Austrian as well as French engineers. We illustrate on page 1059 the novel machine recently built by Herr Wels, a Viennese engineer, who is also greatly interested in aeronautical matters. The sleigh is fitted with a 24-h.p. eight-cylinder engine, the power of which is transmitted to an air propeller at the rear. The latter, which runs at 1,400 revolutions per minute, is of a special design, drawing its air, not directly from the front but angularly from the sides; it is driven by a belt off the rear end of the extension of the engine shaft. The steering, which is controlled like a motor-car by means of a hand-wheel on an inclined

column, is effected by a couple of rudders at the back of the sleigh. The braking and pulling up of the apparatus is effected by four claws—two on each side—actuated by a lever at the side of the driver.

◆ ◆ ◆
Miscellaneous Items.

It is reported that a Riga company is about to put 150 motor-cabs in service in St. Petersburg.—It has been resolved not to hold the usual annual motor-car exhibition in Vienna this year.—The sixth annual International Automobile Exhibition in

newcomer in the hands of the Bourgmestre.—The municipal authorities of St. Quentin, France, have just issued a notice restricting the speed of motorists passing through the town to five miles per hour.—The German Imperial Automobile Club has decided that its Trials of Industrial Motor Vehicles shall extend from April 23rd until May 13th next.

◆ ◆ ◆
Automobiles Militaires.

En Allemagne, dans les grandes garnisons qui possèdent des boucheries militaires, des voitures automobiles spéciales vont être

The Wels Motor Sleigh.

(Allgemeine Automobil Zeitung.)

Turin was opened on Saturday last.—Motorists visiting the South of France with their cars will do well to remember that the municipal authorities of Mentone have just issued a regulation limiting the speed of motor-cars to five miles per hour. The use of sirens, whistles, and open exhausts is also forbidden.—The Motor Cab Company, in Copenhagen, which has already thirty Renault cabs in service, has placed an order for a further twenty-one.—The horse cab drivers in Brussels do not look with favour on the intervention of the motor-cab; the other day they went in procession to the Town Hall to lay a petition against the

introduites, dans le but de transporter les viandes de la boucherie aux casernes. Cette innovation pratique vient d'être réalisée pour la première fois à Metz. Par suite de la grande distance qui sépare les forts extérieurs de la ville, les fournitures de viande à effectuer par la boucherie militaire n'arrivaient souvent pas à temps à leur lieu de destination. L'administration militaire a fait construire par une fabrique de l'Allemagne du sud des voitures automobiles spéciales, pourvues d'une chambre frigorifique et d'autres installations modernes. Ces voitures peuvent couvrir 50 kilomètres à l'heure.

THE J.A.P. AERONAUTICAL ENGINE.

IN continuation of the descriptions we have already published of new petrol engines especially designed for aeronautical purposes, we come to the J.A.P., which, although it made its first public appearance at the Paris Salon in December last, is a British production, being made by Messrs. John A. Prestwich and Co., at their works at Lansdowne Road, Tottenham, N. As will be seen from the accompanying illustration, the engine, which is of the air-cooled type, comprises eight cylinders set in two sets of four at right angles to each other in the form of a V. The cylinders, which are cast singly, are 85 mm. bore by 95 mm. stroke; they are machined all over and for about half their length are provided with horizontal radiating ribs of a very "clean" character, holes being pierced in the same to increase the circulation of air. The inlet and exhaust valves are located in the cylinder heads and mechanically operated, through the medium of tappets and an overhead pivoted lever, off a single centrally-located cam shaft; the latter is of nickel chrome steel and runs on ball bearings. The valve timing gear is of hardened steel and is placed outside the crank case; it will be noticed that short pivoted levers are interposed between the

General view of the J.A.P. Eight-Cylinder Aeronautical Engine.

cams and the tappet rods. The valve-box, which is provided with vertical radiating fins, is cast separately and secured by two studs; the valve seats are in the head of the cylinder, so avoiding any joints in the latter.

The crank shaft, which is hollow, and, like the cam shaft, of chrome nickel steel, is provided with long plain bearings; the crank pins are, however, furnished with ball bearings, 7-16 in. balls being used. There are four crank throws, set at 180 deg. to each other, the connecting rod of one cylinder on each side of the V working on to a common crank pin. The connecting rods are made of steel stampings, the end of one being forked and the other of the usual pattern fitted between the fork.

The mixture is furnished by one of the firm's latest type of automatic carburettors, in which the extra air holes are closed by balls of phosphor bronze, and which, when the suction on the jet exceeds a certain amount, lift off their seating and let in the necessary quantity of additional air. The lubrication is effected on the J.A.P. combined system of drip feed and splash, a constant supply of oil being maintained by the partial vacuum set up in the crank case by a special vacuum valve. The crank case, which is of aluminium, is divided into four separate compartments, to ensure perfect lubrication to each pair of cylinders. All the parts

are made on the interchangeable system, the cylinders, pistons and rings being within $\frac{1}{1000}$ th of an inch of perfect accuracy.

The engine, which will be exhibited for the first time in this country at the forthcoming Cordingley Show at the Agricultural Hall, is rated at 35-h.p. at the normal speed of 1,500 revolutions per minute; its weight complete is 170 lb., or just under 5 lb. per horse-power. We may add, in conclusion, that Messrs. Prestwich are also building an eight-cylinder motor on similar lines, but which will be water-cooled, the cylinder jackets being of electrolytically-deposited copper.

A FAR-REACHING GUARANTEE.

ABRIEF reference has already been made in these columns to the new guarantee system which is being introduced by the Long Acre Autocar Company, Ltd. (the successors to the Junior and O.T.A.V. Cars Company, Ltd.), of 117, Long Acre, W.C. From the very exhaustive pamphlet which has just been published by the company we find that the guarantee is a more comprehensive arrangement than we at first thought and one that is likely to attract considerable attention.

As may be gathered from the fact that the booklet extends to fourteen pages, we have not space to reproduce the whole of its terms. It may be briefly stated, however, that in future a guarantee is to be issued with every car purchased from the company, which practically covers the whole cost of upkeep with the exception of petrol, lubricating oil, and insurance for one year or for a distance of 5,000 miles. Such important matters as tyres, adjustments, replacements and repairs are all covered, as also every detailed form of inspection and rectification that the car is likely to require under fair usage for the time and distance named. At the end of the first year the purchaser has the option of renewing the guarantee by paying the company a moderate fee, and is thus enabled to run his car on the most economical lines and yet feel that his vehicle is at all times in thorough road-worthy condition. A noteworthy feature of the guarantee is that the company undertake to send a qualified mechanic, free of all cost to the car owner, to any part of the British Isles, in order to carry out such adjustments and repairs as may be required. The pamphlet, a copy of which will be sent on application to the address given, is well worthy of close study, in view of the radical departure it outlines.

AN UP-TO-DATE CITY IN FLORIDA.

THE Mayor of Kissimmee City, Florida, evidently means to be up-to-date, as he has just issued a series of regulations with regard to aerial traffic. According to these the Municipal Authority extends not only to the terrestrial limits of the city, but to all the space above it to a height of twenty miles. No shed for an airship or aeroplane can be erected without the authority of the Council, who demand an annual tax of £20 for the licence; a scale of annual registration fees has also been drawn up, ranging from £4 for an ordinary balloon, to £40 for an aeroplane of the ornithoptere type. Apparently the Mayor of the city, which should quickly become famous, is a firm believer that the day of the flying machine is at hand, for he has provided for a supplementary annual tax on aerial machines capable of carrying passengers, the scale ranging from machines capable of carrying from five to no less than a thousand persons. Aerial craft for the transport of goods are to be especially encouraged, for no tax will be imposed on these for the first fifteen years. When flying at heights between ten and twenty feet above the house-tops no machine must exceed a speed-limit of eight miles per hour, but the higher one flies the greater is the speed permitted; in fact, the Mayor of Kissimmee City will allow anyone who will rise to a height of a thousand feet to travel at 200 miles per hour—if he can. Article XI. of the regulations provides that any violation of the same will render the offender liable to a fine of £100 or imprisonment for ninety days; It is also stated that the Municipal Council will, as soon as possible, acquire an aeroplane of the latest type to enable its representative to see that the regulations are duly carried out.

AERONAUTICAL NOTES.

M. CORNU, of Lisieux, France, is building a new flying machine of the helicoptere type.

HERR BUSCHBAUM, of Berlin, is building a new aeroplane, with which he hopes to carry out some trials in May next.

THE Aero Club des Ardennes has just been formed at Charleville to foster the aeronautical movement in that part of Belgium.

It is stated that a French captain of Engineers named Comte is about to make some trials at Boulogne-sur-Mer with an aeroplane of his own design.

THE U.S. House of Representatives has just passed a bill for the addition of £100,000 to the Army Appropriation Bill, to be used in aeronautical experiments.

THE "Gazzetta dello Sport," of Milan, is organising for the coming summer a competition for flying machines between Turin and Milan. A sum of £600 will be offered in prizes.

THE association of merchants in Tunis known as the "Tunisie Industrielle" is offering a prize of £200 to the first aviator who shall fly from Carthage to Utique and back within an hour.

THERE is some talk, in connection with the international exhibition which is to be held in Brussels next year, of organising regular services of steerable balloons between the capital and several of the large Belgian towns.

UNDER the patronage of Prince Albert of Belgium a new company has been formed in Brussels for the construction of dirigible balloons and aeroplanes. The building of two large vessels is to be put in hand immediately.

MR. J. T. C. MOORE-BRABAZON last week succeeded in making a flight of about five kilometres on his aeroplane at Chalons-sur-Marne; the apparatus, which is of the Voisin type, is fitted with a Vivinus motor.

THE U.S. Senate has passed a resolution instructing the Secretary for War to award Messrs. Orville and Wilbur Wright gold medals in recognition of the services rendered by them in the advancement of aerial navigation.

A NEW aeroplane has recently been built by Herr Mosser, of Hagenau, Alsace. Two engineers of the Alsace Engineering Company, of Mulhausen, are also reported to have made a successful flight on an aeroplane they have lately constructed.

AN Austrian engineer named Hermann Stofa is building a new type of aeroplane near Vienna. In place of the surfaces being horizontal, cylindrical revolving surfaces are employed, the propeller screws being fitted behind them, the aim of the system being to achieve stability.

CHALONS-SUR-MARNE is becoming quite an aeronautical centre. In addition to Messrs. Farman and Moore-Brabazon and the names mentioned in our last issue, other aviators who are about to make trials with aeroplanes at that place include Prince Rolodoff, M. G. Soisin, M. Goupy and Mr. Hubert Latham.

IN order to remedy the backwardness of Austria-Hungary in the navigation of the air an Austrian syndicate has purchased M. Farman's aeroplane, with the exclusive right to use it in Austria and Germany. M. Farman is instructing an Austrian mechanic in the use of his aeroplane, which will be taken to Vienna during the course of next week. The first flights will, it is stated, be made by M. Farman himself.

THE committee of "pupil-pilots" formed by the French Ligue Nationale Aérienne is daily expecting delivery of the first of the aeroplanes which have been ordered for the purpose of enabling practical instruction to be given in the handling of flying machines at the new aerodrome at Juvisy. The first will be of the Delagrange-Farman type, built by Messrs. Voisin, Billancourt, near Paris.

THE All-Russia Aero Club, which enjoys the patronage of the Czar, who has approved the idea of making a national collection for the equipment of an aeroplane fleet, has decided to acquire one of the Wright machines. The cost is said to be £1,200, and the machine will be obtained as early as possible, so that flights may be made in Russia during the coming spring.

MR. SANDON PERKINS proposes to make use of a flying machine in his next polar expedition. This Arctic explorer proposes to go as far north as possible by boat, after which he will make use of aeroplanes, one of which will ascend in a vertical direction to enable him to dispatch wireless telegrams en route. A model of one of the aeroplanes which Mr. Sandon Perkins proposes to use, is being exhibited at the Motor Club in London.

A SUM of £4,000 having been provided for in this year's Budget by the French Government for the encouragement of aerial navigation, M. Louis Barthou, the Minister of Public Works, has appointed a commission to superintend the administration of the fund. Amongst the members are M. Henri Deutsch de la Meurthe, the well-known patron of aeronautics, M. Leon Barthou, president of the Aerial Committee of the Touring Club de France, M. Bleriot, and M. Painlevé, vice-president of the Ligue Nationale Aérienne.

WE illustrate herewith the model of a novel design of airship recently built and patented by Mr. W. Friese-Greene, of Brighton. It is made up of two gas balloons placed side by side, the idea being that should one bag collapse there will be no fear of accident. The airship has also a gyroscope balancing device. Four motors are provided, one driving the gyroscope, another the propeller, while two are kept in reserve. The gyroscope is used for steer-

ing, its position being altered by means of gear attached to an ordinary ship's wheel. The airship can be made to rise or descend by a movable weight travelling on an endless band from end to end of the machine. Two planes are also used to alter the angle of the airship.

THE French Ligue Nationale Aérienne, in whose charge the competition for the Pommery Cup has been placed, have decided that the flight must be undertaken as one continuous effort, without landing or replenishing. In other words, it must be in the nature of the cross-country trip which Farman made between Chalons and Rheims. The cup is of the value of £2,000, and is awarded half-yearly, the winner receiving £300 in cash.

NAVAL men are probably taking great interest in aeronautical matters, but the Royal Naval Aero Club, which a contemporary has reported to be in course of formation at Devonport, is apparently still "in the clouds." Lieut. A. Williamson, R.N., who was said to be the hon. secretary, knows nothing of the matter.

CAPTAIN W. WINDHAM, who has done service for the aeronautical movement in the organisation of the Aeroplane Club, is reported to have designed an aeroplane. Captain Windham's machine is a bi-plane with a 25 h.p. Duthell-Chalmers engine, the front plane being for lifting and that at the rear for steering. It is fitted with both horizontal and vertical rudders, and has two wooden propellers. The machine is being constructed at Messrs. Pischhoff-Koechlin's works in Paris, and it is said that, should it prove a success, the Russian Government may make an offer of purchase.

Aeronautical Notes—continued.

THE Danish Aeronautical Club has just been formed in Copenhagen.

A NUMBER of aeronautical enthusiasts in the Cannes district are establishing an aeroplane trial ground in the Laval plain, near La Napoule.

THE Syndicat des Inventeurs Aviologistes is the name of the latest society to be formed in Paris, in connection with the aeronautical movement.

IT is reported from Tokio that the Japanese Government is establishing a department to carry out experiments with airships and aeroplanes.

LE SYNDICAT D'INITIATIVE DE VICHY is looking into the question of establishing an aeroplane trial ground in the neighbourhood of Vichy, France.

AMONG the newcomers at the Issy-les-Moulineaux trial grounds, near Paris, is the Witzig-Liore-Dutilleul aeroplane; this is of the bi-plane type and is fitted with a 50-h.p. Renault motor.

As a result of a meeting held last week at Nancy, France, when M. Quinton gave a lecture on aeronautical matters, it has been decided to form the Ligue Nationale Aérienne de l'Est.

A NEW aeroplane known as the Borgnis was subjected to a trial at Gennevilliers, France, on Sunday last, when a short flight was made. The apparatus is of the tri-plane type and is fitted with a 30-h.p. six-cylinder engine.

WE illustrate a novel flying machine lately designed by Messrs. Vuitton and Huber, and which has been entered for the competitions at Monaco. The apparatus, which is of the helicopter type, is being fitted with one of the Farcot eight-cylinder engines described in a recent issue of the *M.C.J.* The vertical shaft of the motor operates two propellers rotating in opposite

directions in a horizontal plane, these being relied upon to sustain the machine in the air. A third propeller is fitted at the rear for propelling purposes. The machine is being constructed in the Paris district, and is already completely erected with the exception of the engine.

UNDER the auspices of the Aero Club de Nice the "Eclaireur de Nice" is organising an exhibition of models of airships and aeroplanes to be held in Nice from the 1st to the 15th March next. No charge is being made for space, but entries should be sent in to the newspaper named before the 25th inst.

MONSIEUR F. RAMEL, of Glennes-les-Fismes, France, has just completed the construction of a new type of aeroplane which differs in many respects from those that have hitherto been seen. Instead of the pilot's seat being on the aeroplane itself, it is suspended from the machine in such a way as to act as a sort of balancing device. M. Ramel will shortly commence trial flights with his apparatus, which, including the pilot, weighs about 1,100 lbs.

THE French Ligue Nationale Aérienne, realising that the charges to aviators using the practice-ground at Issy-les-Moulineaux, near Paris, are becoming increasingly heavy, amounting now to as much as 32 francs a day each for the mere service of having the place kept clear for them, has decided that as from the 1st inst. it will defray from its own funds half the cost of guarding the course. Efforts are also being made to induce the authorities to lower the charges.

MESSRS. WILBUR AND ORVILLE WRIGHT have now completed the remounting of their aeroplane at Pont-Long, near Pau, and Wilbur will probably make his first ascent early next week.

MR. J. A. MACKLE, of Liverpool University, has been lecturing on the progress of flight, before the Coventry Graduates' Centre of the I.I.A.E. He gave descriptions of most of the aeroplanes which have attained success on the Continent.

M. H. DESCHÉ, the Mayor of Morsang-sur-Orge, France, has placed under the control of the Aero Club de France a plot of land near that town as a prize to the aviator who first succeeds, during the present year, in flying for a distance of 20 kilometres and landing within 60 yards of the land in question.

FOLLOWING the example of the University of Göttingen, the authorities of the Technical College at Charlottenburg have appointed the well-known German aeronaut, Major Parseval, inventor of the airship which bears his name, as Professor of Aeronautics. The Major will immediately begin a course of lectures on aeronautics, which henceforth will be added to the regular subjects of study at the College.

IT is reported that Count Zeppelin intends to carry out many important manoeuvres this year with his dirigible airships, and these will be studied very closely by the German military authorities. Although an airship presents a very big target to a specially-designed and rapidly portable gun, it will be the aim of the Count to show that his vessel can accomplish much useful work without incurring an excessive amount of danger from these weapons.

THE new Zeppelin airship, which is being constructed at Manzell, on Lake Constance, is expected to be ready for its first trial on March 15th. Zeppelin No. II. will be 136 metres long and 13 metres wide, with a capacity of 15,000 cubic metres; it will be fitted with two German Daimler motors, each of 200-h.p. The "cabins" will be more luxurious and more comfortable than in the former airship, and will include a bedroom (with a real bed) for the count, and another with hammocks for the crew.

IN connection with the aeronautical exhibition to be held at Frankfurt-on-Main next year, it is proposed to run an airship regularly between that town and Homburg, the fashionable watering-place. The aerostat would be connected by ropes with two cables, one on each side of the route, which would render the control a much simpler matter than if it were hovering free in the air. It is proposed to employ a balloon which could carry a car containing sixty persons. The cost of the undertaking is estimated at £30,000.

THE first aeroplane seen in Berlin attracted a crowd of at least fifty thousand persons to the Tempelhof Parade ground, on Thursday, last week, when M. Arnaud Zippel made experiments with a Voisin machine. The weather was bitterly cold, but the aeronaut mounted his apparatus and dashed off at a high speed; he, however, only rose a few feet from the ground, and then for only a minute or so. Continuing the trials on Monday, M. Zippel was more successful, he flying nearly three-quarters of a mile against a brisk wind at an average height of 30 ft.

THE aeroplane trial ground, which has recently been established by La Société d'Aviation near Juvisy, ten miles to the south of Paris, and which has become known as Port-Aviation, is now in daily use. The perfectly flat field, over 250 acres in area, has a circular track of about two miles, a straight-away of one mile, and, surrounding it, sheds for aeroplanes and dirigible balloons, workshops and garages, coal and hydrogen gas plants, observation towers, grand stands and postal and telegraph offices. Already there are several aeroplanes, including an Antoinette 50-h.p. bi-plane, and lessons are being given to a number of the student-pilots of the Ligue Nationale Aérienne, under the direction of Capt. Ferber and M. Legagnur. In connection with these lessons an amusing incident occurred. When the little party of students turned up to take their first lesson they were eager enough until it came to the question of making a practical trial, when each pupil was anxious to cede the honourable first place to another. Finally, as none of the six would venture, M. Delagrangé himself went for a short flight. Since then, however, several of the students have succeeded in making short flights.

GOSSIP FROM PARIS.

An Aeronautical Exhibition.

The idea of holding a great aeronautical and aviation exhibition in Paris next year is fast gaining ground, but the French Government, which should take the enterprise under its direct patronage, has not yet given its decision. The Public Works Committee of the Chamber has examined the project and pronounced favourably on it. The Champ de Mars is no longer available for international shows, but various other sites have been suggested. Among them are the Esplanade des Invalides, the Tuileries Gardens, and the Issy-les-Moulineaux parade ground; but there seems to be a majority among the most interested parties for the great open space in the Bois de Boulogne between Bagatelle and the Seine. The French, who claim to be the pioneers in all sorts of aerial navigation, are most anxious to have the honour of organising the first great international exhibition, to which all the civilised nations of the world would be invited to send their spherical balloons, dirigibles, and aerial craft heavier than the air. Of course aerial competitions of every description would be held, as it is believed they would prove a great attraction.

The Monaco Aeroplane Competition.

When the Monaco aviation fêtes were announced some months ago, quite a number of aviators hastened to inscribe their names as competitors for the tempting prizes of £3,000, £600, and £400. They were MM. Demarest (Antoinette monoplane), Delagrangé (biplane), Pierron (biplane), Louis Bréguet (gyroplane), Baron de Caters (biplane), Louis Bréguet (biplane) and G. Vuitton (heli-coptère). Probably they did not quite realise what was required of them. At first sight a flight of some six miles from Monaco to Cap Martin and back, to be repeated on three days at the choice of the aviator, did not look a very terrible enterprise. Delagrangé was, however, the only man among them who had flown that distance; some of the others had never left the ground on their machines. It has been said several times that if Wilbur Wright did not go to Monaco to gain an easy victory he would at least send one of his pupils. And Henry Farman's name was also mentioned as certain to be found on the list of entries. However, the competition, which closes at the end of March and which opened on January 24th, has not yet attracted any one to Monaco, and it is a significant fact that Wilbur Wright and Henry Farman, the two men who have achieved the most remarkable aerial feats, have never expressed the intention to seek to win the prizes. On the contrary, Wilbur Wright has established himself comfortably at Pont Long, Pau, where he is to complete the education of his three pupils, and Henry Farman has sold his machine. Probably if the competition had been quite so easy as its organisers may have imagined the American aviator would have obtained from the Weiller Company a short delay in the training of the men who are to ride his machines, and Henry Farman would have rejected the offer to buy his old aeroplane or have stipulated a delay for delivery. Neither of them did anything of the sort. Why?

Some Difficulties.

I can imagine at least some of the reasons which influenced them, and which have probably prevented Delagrangé from hurrying down to the sunny South. To make the flights may be comparatively easy—at least, for Wright, Farman, and Delagrangé; but how are they to land on the quay, which is not more than thirty yards wide, with an available length of 100 yards at the utmost? Wright with his skis might manage it safely, but assuredly all the aeroplanes depending on wheels for landing would run great risk of rolling over the quay-side into the water. Then Wilbur Wright and all the other aviators put their machines together very carefully after a journey and test them well in short flights before undertaking anything like a remarkable performance. But at Monaco there is no open space for preliminary trials. It can be easily imagined a man would hesitate to get on his machine to fly over the Monaco bay if he had had no opportunity to ascertain for certain whether

it was in good working order. It is true the regulations of the competition require that each of the flying machines shall be provided with an apparatus of some sort to prevent the aerial vessel from sinking in the case of its falling into the sea; and when the organising committee realised the difficulty of the landing of the aeroplanes on the quay, it decided to allow both the start and the landing to be made from the water. But an aquatic aeroplane has not yet been invented. I have spoken to a good number of aviators and patrons of aviation with regard to the Monaco competition, and the general opinion seems to be that at the present moment there is only one man in France who could with a fair chance of success attempt to accomplish the feat required by the conditions of the competition, and that man is Wilbur Wright. He could with his skis land on the quay, but the question is, would he venture to set out on a flight over land and sea without first testing his machine? I doubt it. Delagrangé has ordered floats for his aeroplane, and Henry Farman's new machines, one of which will soon be ready, will be provided with wheels for starting and with skis for landing. Both these aviators may try to win the prize as well as Moore-Brabazon, who has already accomplished remarkable performances, but I think it

Touring in France.—Crossing the Ferry over the Seine at Caudebec.

is unlikely. The public must not be astonished or disappointed if no one should even attempt to capture the £3,000. MARNEY.

THE Board of Health of Indianapolis, U.S.A., has ordered an electric motor ambulance to be used by the City Dispensary in place of the horse-drawn vehicle hitherto employed.

THE Canadian authorities have raised the embargo on American motor-cars, which was put in force about two months ago to prevent the spreading of the foot and mouth disease from the United States to Canada.

THE increased use of the planetary or epicyclic type of change-speed gear was perhaps the most noticeable feature at the recent Motor Show in New York. The number of cars fitted therewith increased from 4 per cent. to 11 per cent. of the total. The friction drive also advanced in numbers from 11 per cent. to 17 per cent.

MADRAS AUTOMOBILES, LTD., is the name of a new company which has lately been formed in Madras, India, the share capital having been subscribed among the principal motorists of the presidency. The company's works are situated in a three-storied building 100 ft. long and 32 ft. wide, and are fitted with most up-to-date machinery driven by electric power.

THE SOCIAL WHIRL.

HIS MAJESTY THE KING and his Royal Highness the Prince of Wales motored from Windsor Castle to the Flemish Farm one day last week, intending to have a day's shooting over the adjoining coverts. They had fair sport in the morning, but after luncheon, which was served at Cranbourn Tower, the park became enveloped in a dense fog and the Royal party had to return to the Castle.

"To smoke or not to smoke" in the library of the new automobile club-house in Pall Mall. That is the question which is agitating many good people at the present time. Mr. Richard Muirhead, of Gravesend, who ranked among the first score of members of the old A.C.G.B.I., is against smoking in the library as tending to give a "frowsy" smell to the volumes, and Mr. Carew-Gibson and Colonel J. R. Magrath have also written against the permission of such a practice. Probably the better way would be to provide a room adjoining the library where books and papers could be taken by those who wished to enjoy the weed while reading. Another point in connection with the new club-house concerns the admission of ladies, and Mr. J. Colquhoun Reade, of Brooks's, suggests their admittance as members on the same conditions as those under which they are now received as members of the Bath Club.

THIS week I am able to reproduce a photograph of Mr. G. P. Mills, M.I.M.E., A.M.I.C.E., who has been appointed works' manager to Messrs. Clement-Talbot, Ltd., in succession to Mr. C. R. Garrard, who has gone to Sheffield. His way of progress from a cycle works at Biggleswade to the management of the great establishment in the Barlby Road, Kensington, is known to all who have followed the course of the cycle world. He made several long distance records on the cycle, and the road from Land's End to John o' Groat's was vanquished by him long ago. Mr. Mills also did much to organise the works of the Raleigh Cycle Co. In motoring annals his conspicuous success was winning the Heavy Tourist Car Trophy

race in the Isle of Man, in 1907, on a 30 h.p. Beeston Humber. With Mr. F. W. Shorland at the head of the commercial side, and Mr. Mills in command in the works, the Clement-Talbot Company will continue to add to its laurels.

THE Hon. A. Stanley is disposing of his Kentish seat and estate, including Holwood Park and House. The estate extends to Cudham, and the famous test hill runs through the Cudham estate. The garage at Holwood House includes two Austin cars, two Napiers and a Napier station brake, as well as the Mercedes petrol-electric car that the late Earl Derby purchased and used.

MR. HUNTLEY WALKER's country seat at Pickhurst, Hayes, Kent, is now being rebuilt after the recent fire. His letter of thanks to the officers of the Farnborough and Beckenham fire brigades was read at the annual dinner of the latter brigade last week and much appreciated.

MR. HARVEY FROST informs me that he is leaving London on Thursday, the 4th inst., for the Far East on a business tour in connection with the vulcanisers which bear his name. He is travelling by the overland route to Marseilles, where he will embark on the P. and O. s.s. "Malwa," for Bombay. There he will remain until March 1st, when he will proceed by rail to Calcutta, spending about ten days in that city. On March 17th steamer will be taken to Rangoon and about a week spent in Burmah.

On March 25th the trip will be resumed to Singapore, which Mr. Frost expects to leave about April 6th for Colombo. From thence he will take steamer to Port Said and visit Alexandria, Cairo, and other Egyptian centres. Although doubtless he will take advantage of the opportunity of seeing the sights to be met on his interesting journey, the primary reason of the trip is to get into personal contact with many of the numerous customers of the firm in India and the Straits Settlement, where there is an increasing business in vulcanising plant. Letters addressed to Poste Restante of the various ports which Mr. Frost will visit will reach him up to the date mentioned.

THE motor-car comedy planned by Mr. F. T. Jane, of Portsmouth, and Lieutenant Wilson in connection with the "abduction" of Mr. Victor Grayson, M.P., on the last day of the labour congress in the naval port, was worthy of George Bernard Shaw, who was also a delegate, though he apparently travelled by ordinary train and did not use his motor-car, in the driving of which he is said to be an expert. Taking Mr. Grayson right away from the ocean of oratory saved the delegates from a speech—"for which relief much thanks," as Shakespeare would say.

MAJOR KENNETH COOMBE, of the Royal Horse Artillery, is one of those sportsmen who use the motor-car on the hunting field. Like many another follower of the hounds he finds it a great convenience to be able, at the conclusion of a meet, to hand his mount over to a groom and fulfil any further engagements with the help of the motor-car.

MANY adventures might be recorded as taking place in the fog of last week. Miss Paterson, who recently attained distinction on the Brooklands Track, started from the Carlton Hotel, London, on the afternoon of the 26th ult. on a 16-h.p. Imperia car for a twenty-four hour non-stop run to Edinburgh. On account of the impenetrable fog it took her ten hours to do sixty miles from Grantham northwards, and she ran off the road twice into a farmyard, and also went in and out of Bawtry twice. While between Doncaster and Darlington a speed of more than four miles an hour was impossible owing to the fog. During all the journey, however, they were not stopped once for mechanical reasons.

THE issue of a Guide to Boston, in Lincolnshire, by the Homeland Association, Ltd., reminds me of the Peacock and Royal Hotel in that ancient town. This is under the proprietorship of Mr. R. H. Clemow, and is in connection with Anderson's Hotel, in Fleet Street, London, E.C. There is good motor-car accommodation at the Peacock, which might well be made the headquarters for a tour of the Lincolnshire fens. Boston is well regarded by motorists, for, although the narrowness of some of the streets necessitates care at all the turnings, there are no specially dangerous corners in the town. Although there are several ferry and bridge tolls in the county of Lincolnshire, there are none in the vicinity of Boston, where the Automobile Association has appointed Messrs. Holland Bros. as its agent. With their help in replenishing the petrol tank and the guidance of the Homeland Handbook a pleasurable week-end can be spent in the ancient Lincolnshire borough. LOLLIS.

FROM Sir Isaac Pitman and Sons, Ltd., comes a new edition of the Business Man's Guide, by Mr. J. A. Slater, this being a repository of commercial information of every description. In addition to commercial terms and phrases much geographical information which will be of value to business men is included in the volume, and the French, German and Spanish equivalents of English terms and phrases are also given. Reference is made to the motor-car, and the letters of identification are included. This, however, should have been brought up to date by those for Merthyr Tydvil and the new London letters being added to a list otherwise complete. It is obvious that many matters cannot be fully dealt with, and a little guidance as to special works to be consulted might prove a useful addition to a volume which is becoming a recognised work of reference.

THROUGH Messrs. Boon and Porter, Messrs. Lyons and Co., Ltd., the well-known London caterers, have purchased a number of Renault and Lacre motor vehicles.

A SYNDICATE has just been formed in Berlin, with a capital of £20,000, for the purpose of establishing a motor racing and speed trial track in the neighbourhood of the German capital.

DEPRESSED at being unable to secure a licence as a motor-driver, George Dorsen, of Westminster, was found in the Thames, and a verdict of "Suicide" was returned at the inquest on Monday.

COLONEL R. E. CROMPTON, C.B., has consented to open the forthcoming show of the Manchester and District Motor Trades Association, Ltd. This will open at Bellevue on the 19th inst. and close on the 27th.

AT the extraordinary general meeting of the Star Cycle Company, held on the 29th ult., with Mr. E. Lisle in the chair, the resolution to alter the title of the firm to the Star Engineering Company, Ltd., was adopted.

CAPTAIN KELLY is reported from Cairo to have successfully completed the first trip in a motor-lorry from Khartoum to Kassala and back. The distance between the two places is 255 miles. The journey out occupied four, and the return trip two days.

SUPPLEMENTING the particulars we gave in our last issue regarding the novel four-cylinder engine lately put on the market by the Société des Automobiles Aries, we may state that the bore and stroke of the pistons is 60 mm. by 100 mm. and that the engine is rated at 8-10-h.p.

THE Brixton Motor Works, of 283, Brixton Road, London, S.W., have lately opened an additional garage, with accommodation for about twenty cars, a few doors away from their present premises. The firm are able to undertake all classes of repairs and have also plant for vulcanising tyres and charging accumulators.

FURTHER tests are about to be made at Constitution Hill, Chatham, that is claimed to be the stiffest hill within a wide range of the Metropolis, and which was recently climbed by a 15-h.p. Talbot. The gradient is 1 in 4½, and, on account of the right-angled turn at the foot of the hill, it can only be taken on first speed. There is no doubt it is an extremely severe trial.

WE hear that the Star cars have become a popular type in Australia, and in view of the increasing demand agencies have been established in three leading centres. The agents in Sydney are Messrs. Larke, Hoskins and Co., in Melbourne the Herne Motor and Engineering Company, while in Adelaide the interests of the Star Engineering Company are looked after by Messrs. Vivian Lewis, Ltd.

THE annual race meeting on the Ormond-Daytona beach, Florida, will be held from March 23rd to 26th inclusive. Several important events have been proposed, including a race open to cars which have contested the Vanderbilt Cup, the race for the Minneapolis Trophy, a stock car sweepstakes, and the competition for Sir Thomas Dewar's £400 trophy, the winner of which must attain a speed rate of 120 miles per hour, or two miles a minute.

SOME interest is attached to the new garage that has been opened by Mr. D. T. Allen, on the London Road, Bromley, Kent, as it adjoins the goods yard at South Bromley station, where Signor Scarfoglio's Pekin-to-Paris car was destroyed by fire in October last, the local mechanic, Maynard, receiving fatal injuries. The new head-quarters of the Bromley and Beckenham Motor Drivers and Mechanics' Club are in proximity to the garage. The club has fifty members, and the new club-house is being provided with a billiard room, &c.

ACCORDING to a return just published relating to registration and licensing under the Motor Car Act, eighty-five motor-cars and eighty-two motor-cycles were registered in Croydon during 1908, this being exclusive of transfers of ownership. The number of driving licences granted, exclusive of renewals, was 612, and the total sum received in fees was £314 8s. For the four years ending 1907 440 motor-cars and 586 motor-cycles were registered, 2,068 driving licences were granted, and the fees received by the borough came to £1,344 10s.

AN exhibition of agricultural motors is to be held at Amiens, France, from July 17th to 26th next.

THE French postal and telegraph authorities are at present inviting tenders for the carriage

of the mails between Aix-les-Bains and Chatillard, Savoy, by motor vehicles.

MESSRS. O. MACKAY AND SONS, whose motor garage is near the West Park, Harrogate, have facilities for assisting motorists visiting the town and have also motor-cars for hire by residents and others.

MR. W. CHAPMAN has lately considerably enlarged his premises at South Norwood and has now accommodation for a large number of cars. Repairs of all kinds can be carried out, and plant is available for vulcanizing tyres, charging accumulators, &c.

A NEW car known as the Acme, and constructed by the Acme Motor Company, of Reading, Pa., U.S.A., is being introduced into this country by Messrs. R. Scott and Co., of 96, Castlenau, S.W. The first vehicle that has been received is a 30-40-h.p. four-cylinder model; the engine has separately cast cylinders, and the final transmission is by side chains.

An Indian Motor Depot.

The above illustration depicts the motor depot and garage of Messrs. Oakes and Co., Ltd., Madras. The firm are agents for several of the leading types of cars and are well equipped for carrying out repairs.

MESSRS. LUND AND SERGENT, whose show rooms are in Princess Street, Stockport, are arranging trial runs on a 10-h.p., four-cylinder, two-seated Delage car. They have a large business in the exchange of motor vehicles, taking old cars in part payment for those of different makes. Keeping a good stock of such vehicles, they are well able to meet the requirements of clients in the north of England. Messrs. Lund and Sergent will have a display at the forthcoming Manchester Motor Show.

WHAT may safely be described as the biggest fire which at any time has visited an automobile centre occurred in Boston, U.S.A., on the 17th ult. Within half-an-hour after the first flames shot up from the rear of a big garage building near Park Square, about 400 automobiles, valued at between £140,000 and £180,000, were reduced to shapeless masses. The heaviest losses, so far as can be ascertained, are as follows:—Park Square Auto Station, 150 cars, valued at £70,000; Concord Motor Company, fifty-four vehicles, valued at £30,000; Messrs. Thomas B. Jeffery and Co., forty-four cars, valued at £25,000; Boston Auto Exchange, thirty machines, valued at £20,000; and the Mills Transportation Company, eight cars, valued at £5,000. A number of sightseeing cars and commercial vehicles, owned by various companies, were among those destroyed, as well as many cars owned by private individuals.

Here and There—continued.

A NEW garage has been opened at 11, London Road, Tunbridge Wells. The proprietors are Messrs. Clarke and Rawson.

A NEW automatic carburettor, for which several claims are made, has lately been brought out by Messrs. F. Ray and Sons, motor engineers, Elms Buildings, Eastbourne.

MR. T. NORMAN STONE, of the Victoria Motor Works, Godalming, has a well-equipped establishment and is able to render good service to the many motorists of Surrey.

No. 3 of the Daimler Company's Bulletin has just come to hand. It is well illustrated and contains several interesting articles, notably one on a trip in Australia and another by Mrs. Kennard, who gives her views on the new Daimler engine.

THE French Automobile Club has decided to organise another trial of industrial motor vehicles in October and November next. It will be held in conjunction with the test of military vehicles, and the trial runs are expected to be over roads radiating from Paris.

THE Motor House have obtained the whole stock of the sole concessionnaires for the Maja cars, and these chassis are now being offered at considerable reductions from their original prices. The vehicles are 20 to 30-h.p., and the selection includes both chain and live axle drive. Any type of body can be fitted to these chassis, which present favourable opportunities for acquiring cars.

A Motor Accident near Whitechurch.

A somewhat remarkable motor accident occurred on the high road leading from Whitechurch to Market Drayton on the 22nd ult. Mr. E. Norton, accompanied by his wife and a lady friend, was driving to a dinner party in his 12-14-h.p. Argyll; they had only gone about three miles when they encountered a bit of road which after being wet had become frozen, with the result that it was simply a sheet of ice for about twenty yards. The car skidded, badly breaking one of the road wheels, causing the vehicle to turn over with the occupants under it. Fortunately the car fell over a drain close to the railings, therefore affording means of escape. The ladies were practically uninjured and suffered only from shock. Mr. Norton, who was driving, received a slight bruise on the thigh.

Photo by]

[Pace, Whitechurch.

THE exports of motor-cars and parts from the United States during the eleven months ending with November last only amounted to £936,884, as compared with £1,091,108 in the corresponding period of 1907. Great Britain headed the list with £332,384, Canada being second with £215,073, and France third with £109,656.

THE new catalogue of the Swift Motor Company, Ltd., Coventry, is conspicuous even among the handsome productions one has come to regard as normal in the case of motor manufacturers. It is copiously illustrated, written with pleasant if forceful argument, and one feels confident that if it falls into the hands of a prospective motorist it will certainly convert him, and probably decide him to buy a Swift. Full particulars are given of the various models—10-12-h.p., 15-18-h.p., and 18-24-h.p.—that are being turned out for the 1909 season; not only are these fully illustrated, but a series of views of the different sections of the Swift Company's works is included. Another interesting feature is a number of full-page coloured pictures, showing the Swift vehicles in their various spheres of utility. A copy of the catalogue will be sent to all applicants mentioning the *M.C.J.*

THE Russian postal authorities in St. Petersburg are now using a Stoeber motor-lorry for the transport of the mails between the General Post Office and the railway stations.

THE United States Civil Service Commission has just held an examination for the position of chauffeur in the quartermaster's department at large. Two vacancies exist at a salary of £15 per month each, which will be filled as a result of the examination.

THE Kempshall Tyre Company, of 1, Trafalgar Buildings, Northumberland Avenue, W.C., have arranged with the R.A.C. for a certified trial of the non-skid properties of the new ribbed low pressure Kempshall tyre. This we understand will take place on the 18th inst.

MESSRS. WITHERBY and Co. have brought out a new monthly magazine, "Travel and Exploration," which is devoted to every form of travel-sport, from hunting trips in Central Africa to skiing in the High Alps. Motoring is included and aviation is not overlooked.

THE "Auto," of Paris, has brought forward a proposal to establish a museum of mechanical locomotion in the French capital. It is suggested that this should not be confined to examples of the early motor-cars, but should also include specimens of the first cycles, motor-boats, balloons, airships, aeroplanes, &c.

TAKING the water-cooled cars exhibited at the recent exhibition in New York as compared with those displayed a year ago, it was found that the use of honeycomb radiators had decreased from 69 per cent. to 62 per cent., while the number of gilled tube radiators had increased from 17 per cent. to 31 per cent.

IN contradistinction to the tendency in Europe, the recent motor exhibition in New York showed that there is a considerable decrease in the percentage of shaft-driven cars, the reduction being from 82 per cent. to 57 per cent.; on the other hand, the double chain drive has increased from 15 per cent. to 41 per cent.

A NOVEL "Panne" competition, on the lines of one organised in France a year or so ago, was held last week by the Birmingham Motor-Cycle Club. Two motor-cycles were provided at the Central Garage in that city; one was fitted with magneto and the other with accumulator ignition, both machines being out of order. The rules provided that the competitor taking the least time to diagnose the fault and get the engine running would be declared the winner.

FROM the Société des Automobiles Peugeot, whose London depot is at 46, Knightsbridge, S.W., comes a copy of their new catalogue. This is one of the most handsome productions of the kind that we have so far received. The list gives illustrations and particulars of the different models of Peugeot cars that are being turned out for the 1909 season. From the point of view of an artistic production the catalogue is a veritable triumph of the printer's art.

THE following particulars of a motor trip in Australia, taken from a leading Australian daily paper, will give British motorists some idea of the touring conditions met with in that country. Mr. Wagstaff, a member of the Victorian Automobile Club, reached Adelaide, from Melbourne, on Sunday, November 1st, having made the whole journey by motor-car. Accompanied by his wife and two friends, he set out from Melbourne on October 25th on his 36-h.p. Daimler, not with the idea of establishing a record, but purely on pleasure bent. Mr. Wagstaff was anxious to demonstrate that his car, the weight of which loaded was 2½ tons, could negotiate the so-called "ninety miles desert." The previous heaviest car to make the journey weighed only 26 cwt., so that the enterprise was distinctly venturesome. The trip was made in easy stages; the actual running time apart from the ninety miles desert was 24½ hrs. for 591 miles. It took another day to cross the desert. Upon his arrival Mr. Wagstaff remarked, "We got right through without any mishap, and experienced neither mechanical nor tyre troubles, nor had we any occasion to use a spanner during the whole trip. I would strongly recommend motorists not to attempt the journey unless they have had a fair amount of experience in motoring generally, and it is not advisable to undertake it in any but a high-clearance car. We encountered a few deep sandy patches which were overcome only by the use of coconut matting, of which we carried two 36 ft lengths."

MOTORING ACCESSORIES.

The "Roslee" Acetylene Generator.

In our last issue we mentioned the motor-car head lamp placed upon the market by Messrs. J. T. Williams and Co., of 344, New Town Row, Birmingham. This shows up a clear road for eighty or ninety yards ahead. The generator used in connection with this is easy to understand and manipulate and lights very quickly.

The lamp and generator is strongly made, some points of the latter being

Fig. 1.

Fig. 2.

distinctly valuable. In the "Roslee" acetylene generator, as it is known, the water overflow point within the generating chamber is gradually lowered at the same rate of speed as the top surface of the water is lowered. So that by making use of the expansive power of the carbide a uniform head of pressure of the water upon the gas is ensured. The flow of water to the carbide is regulated by the backward pressure of the gas within the generating chamber, so that, whatever number of burners

Fig. 3.

are used, both the supply of water and gas are automatically regulated to suit the latter. As originally placed on the market the generator was made in only one size. Its merits have, however, proved so acceptable that Messrs. J. T. Williams and Co. are now making a larger size, in which, while the same system of water supply is utilised, the general

construction of the generator has been altered to render it of greater convenience in use. The generator is illustrated in perspective in Fig. 3, and is intended to be fixed to the step of a car: it has a carbide box D (Fig. 2), which is shown extending above the top of the generating chamber and resting upon a spring E, which is shown in dotted lines. In operating the generator, the body A is turned to the left—an act which releases it from the bayonet catches on the top of the body B. The latter part is filled with water for the purpose of cooling the generating chamber C (Fig. 1). The carbide box D is taken out, as well as its displacer, and filled with ordinary carbide up to the level of the swage. A blotting-pad is put upon the top of the carbide, the displacer is then placed above this, and the box returned to its place on the top of the spring E. The body is then put back and a gas-tight joint made. One or two other simple operations render the generator ready for working. The gas nozzle of the generator is then attached to the purifier and condenser and is ready for use. Well made, as well as well designed, the Roslee generator will prove an economical as well as an efficient device for the use of the motorist who is anxious to maintain a good and uniform light on his car. The device is entirely automatic in action, and will supply gas for two full-size head lamps for over eight hours, or with two acetylene side lamps in addition, for more than six hours. Shown at the recent Scottish Motor Exhibition it attracted considerable notice from experts, and it can be recommended to all anxious to start the touring season free from trouble with their lighting arrangements.

The "Grip" Motor Pedal Cover.

It is claimed for the "Grip" pedal cover, recently introduced by the Pedal Cover Company, Balmoral Chambers, 73, Bridge Street, Manchester.

Fig. 4.

and illustrated in Fig. 4, that it supplies a much-felt want amongst motorists generally, and forms a most convenient method of eliminating the smoothness caused by wear in the use of the clutch and brake pedals of a car. It is also stated to add to the comfort of the driver by absorbing vibration, and to save many times its cost by the economy resulting from the reduced wear of the soles of the driver's boots. The makers also claim that the slight "give" in the covers enables the clutch to be more delicately humoured, thereby saving a certain amount of wear on the gears and tyres. The cover can be fitted instantly to the pedal, all that is necessary being to stretch the lower lip of the arrangement over the plate, using a small tyre lever if necessary. In ordering, the size of the pedal plate has to be mentioned.

MESSRS. R. BURR AND SONS will sell by auction on the 19th inst. the premises at the corner of Edgware Road and Church Street, London, W., which are eminently suitable for occupation as a motor garage and showrooms.

MESSRS. W. AND G. DU CROS, LTD., have nearing completion at their Panhard-Levassor works, Acton Vale, W., a fleet of six rebuilt Pioneer motor-buses, which are shortly to be shipped for use in Constantinople.

Correspondence.

[Letters to the Editor should be addressed to the offices, 21-33, Charing Cross Road, London, W.C.]

OUR PRIZE STORY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have to thank you for your favour of yesterday, enclosing cheque, for which please accept my warmest thanks.

I was gratified to note that you considered my short story of sufficient merit to receive the prize in the competition organised by the *Motor-Car Journal*.—Yours truly,

T. CRAVEN JOHNSON.

[The prize Story, "The Comet of Puddlecombe," appears on another page of the present issue.]

MOTOR POSTAL SERVICES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see you refer to the early trials of motor vehicles by the Post Office as taking place in 1896. They may have had some experimental runs in that year, but I had always thought that Messrs. Gilbert, Bros., of Lincoln, were the first to really undertake the delivery of letters by motor-car. Perhaps they can let us have some reminiscences of their early enterprise in that direction as a matter of interest as well as of historical accuracy.—Yours truly,

A. FENMAN.

A modern Hunting Party in the Rocky Mountains.

ADVENTURES IN THE FOG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be interesting if your readers who were out in the fog in London would give their experiences. Some must have had a very exciting time. I was in the Eltham Road on the Wednesday evening, driving my little 10-12-h.p. vehicle as carefully and as slowly as any Haywards Heath magistrate would desire, when I nearly ran into a couple of motor-buses that had just collided with each other. Fortunately, from the financial point of view, they belonged to the same company, so the question of which was the offender will not reach the public. I hear that in a south-eastern suburb the fog was responsible for a somewhat peculiar motor accident. The driver of a car proceeding along the main road missed his bearings, and, passing his own premises, mounted the pavement in front of his neighbour's shop and smashed three large panes of plate glass. Fortunately the car did not strike any of the people on the pavement, and the owner, who was driving, also escaped uninjured.—Yours truly,

T. C. D.

DETACHABLE WIRE v. WOOD WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is some doubt and a little misconception as to our attitude respecting wood wheels in the detachable form. This appears to be based on the higher charge that we make for them. It may be urged that the wooden wheel is just as cheap or cheaper to make than the wire wheel when the quantities are the same. In our case they are not the same, the demand for the wooden wheel being very small indeed. We have, however, no reason to refuse to supply wood wheels, which, when made of sufficient weight, do not appear liable to give way except under conditions to which a motor-car should not be subjected. Perhaps if one neglects precautions against side-slip one

must not complain if a wood wheel collapses when striking a kerb. The wire wheel, as shown by our tests, which have been confirmed by long experience, will resist far more of this kind of unfair treatment, but it is to the owner whose car is driven with extreme care that the wire wheel most strongly appeals, because of the great saving in unsprung weight, which on four wheels amounts to no less than 70 lbs. It is more widely recognised every day that unsprung weight is the dominant factor in the life of a tyre, and it is chiefly for this reason that the vogue of the wire wheel increases.

This situation, however, hardly justifies us in declining to supply wooden wheels; but we have not yet heard a valid reason why we should supply at a loss an article which we believe to be inferior to the wire wheel to a customer who does not share this belief, but wishes to enjoy the benefits of our detachable system.—Yours truly,

JOHN T. PUGH.

ELECTRICITY FOR CAR LIGHTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see the reference in a recent issue of the *Motor-Car Journal* to the new system of electric car lighting which is being brought out by Messrs. Blieriot, Ltd., and I hope to take an early opportunity of looking closely into the arrangement. The continued vogue of acetylene head lights has led to so many abuses that its use in large towns is now pretty generally frowned upon by the authorities and by considerate motorists. Yet no form of tempered light has been advanced to take its place, so that a majority of the cars used at night for theatre and other work are driven with only the insufficient service of oil side lamps. These, for the most part, serve only the purpose of warning signals, and have no practical value in illuminating the road in front of the vehicle, which, though it may not be necessary for ordinary town work, is an advantage when traversing poorly-lighted streets. The powerful acetylene head lights, despite their advantage for work in the open country, are ill-suited to driving under such conditions and at times constitute a source of positive danger, both to pedestrians and drivers of other vehicles, because of the confusion wrought by their blinding glare. As applied to electric vehicles, electric lighting has proved the unquestionable serviceability of incandescent lamps for this purpose when properly made and installed. The only other questions, those of the supply of the necessary current, of its relative expense and ease of maintenance, remain to be solved, and if these points are all met in the new Phi arrangement, it should meet with a ready adoption, for there can be no question that the electric light has marked advantage over other systems, that it requires no trimming, is always ready for use, and gives a soft glow which, by properly proportioning the size of the lamp to the requirements, may be as strong or as mild as may be desired. It is as certain in a high wind, or when the car is being tossed about on a rough road, as when it is standing in the garage, is free from all risk of fire, discharges no combustible oils or gases in the event of an accident, and may be lighted at will without requiring the driver to leave his seat.—Yours truly,

T. JENKINSON.

THE PRINCIPAL CAUSES OF ROADSIDE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in the article in a recent issue of the *M.C.J.* on the subject of roadside dilemmas. There are undoubtedly still many would-be motorists who fancy that a motor-car is a "bunch of trouble," and who are deterred from purchasing because of that belief. But, however well founded such an idea once may have been, those who have been connected with the movement for, say, the past ten years know that motoring long since lost its sting and ceased to be a mixed pleasure. Troubles, of course, will happen in "the best regulated family," but nowadays they are the exception and not the rule as once was the case, and it is a fact that most of the present-day troubles are due to the man and not to the machine. It is a peculiarity of the average human being that while he realises that a horse requires and must receive attention and care, he is possessed of the notion that any other medium of conveyance, such, for instance, as a bicycle or a motor-car, practically will or should take care of itself. This notion is responsible for most of the vexation that occurs, while much of the remainder is due to too much attention—to tinkering, as it is styled, which is but a definition of that tendency which inspires men to not let well enough alone and to attempt to improve on the extensive and ripened experience of manufacturers.

It would, I am sure, be interesting were you to open your columns to a series of letters from motorists and also motor traders, giving their opinion as to what is nowadays, in their opinion and experience, the principal cause of roadside stoppages. Such information would not only be useful and instructive, but would, I am certain, do much to remove the wrong impression among would-be motorists that I have alluded to.—Yours truly,

BUXTONIAN.

ANTICIPATING THE SUCCESSFUL AEROPLANE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time ago, while reading "When the Sleeper Wakes," written by H. G. Wells about fourteen years ago, I was struck with the description of the flying machines used by the people of his imagination. For example, he says: "The aeroplanes flew safely only in a calm and moderate wind. . . . The starting of the mechanism was only possible from a gigantic car on the rail of a specially constructed stage." These aeroplanes were very large, and went from London to Paris in forty-five minutes. They required similar stages for landing. The aeroplanes were smaller, carrying two persons. "Their sails (planes), which were brilliantly coloured, consisted only of two pairs of lateral air floats (planes), in the same plane and of a screw behind. Their small size rendered a descent in any open space neither difficult nor disagreeable, and it was possible to attach pneumatic wheels or even the ordinary motors for terrestrial traffic to them, and so carry them to a convenient starting place. They required a special sort of swift car to throw them into the air. Its lateral supporting sails were braced and stayed with metal nerves, almost like the nerves of a bee's wing, and were made of some glassy artificial membrane. The engine was very simple in appearance . . . ; it was of the explosive type, burning a small drop of a substance called 'fomile' at each stroke. . . . Steering was accomplished by the opening or

Motoren Gesellschaft have become joint owners with us of these patents and patent rights, and that we are now prepared to grant licences under these patents, jointly with the Daimler Motoren Gesellschaft.

"The 'Mercedes' car, manufactured by the Daimler Motoren Gesellschaft, has been the model upon which the great majority of manufacturers, both English and foreign (especially foreign), have worked to in their own productions, and a number of well-known foreign firms have built up their names and reputations by producing an imitation of the Mercedes, or a car on so-called 'Mercedes lines,' and there are few cars produced to-day which do not embody one or two or several of the following original patents:—

closing of one or two thin strips in one or the other of the otherwise rigid wings. . . . During these downward glides the propeller was inactive altogether."

In the arrangement of the planes, the starting mechanism and the pneumatically-tyred landing wheels, Mr. Wells seems to have anticipated some of the latest successful flying machines.—Yours truly,

AVIATOR.

AUTOMOBILE PATENT RIGHTS.

IN sending the following letter, which they have received from the Mercedes Daimler Motor Company, Ltd., Messrs. Jarrott and Letts, Ltd., intimate that the matter is being brought before the Society of Motor Manufacturers and Traders. The letter referred to is as follows:—

"Gentlemen,—You are no doubt aware that the British and Colonial Patents and Patent Rights known as the 'Mercedes' or 'Daimler' patents of the Daimler Motoren Gesellschaft, of Unterturkheim, Germany, for which rights our predecessors paid £40,000 in cash, have been owned by this company for many years past, but that owing to prolonged litigation between the Daimler Motoren Gesellschaft and ourselves we have been unable to deal effectively with such patent rights.

"We now beg to announce that under an agreement dated May 1st, 1908, between the Daimler Motoren Gesellschaft and ourselves, the prolonged litigation referred to has been settled, and that the Daimler

Improvements in Reversing Gears.

March 27th, 1906, Paul Daimler: No. 7337.

Front Wheel Drive.

November 8th, 1905, Daimler Motoren Gesellschaft: No. 25067.

And also Patents Nos.:—10257/98; 3023/01; 3571/04; 3572/04; 3573/04; 4956/04; 23990/04; 22947/04; 25050/05; 25076/05; 25104/05; 25051/05; 25081/05; 25103/05; 3514/06; 2360/06; 6202/06; 6685/06; 10263/06; 11407/06; 11407A/06; 7028/06; 6346/06; 14850/06; 14851/06; 20298/06; 7213/06; 25762/06; 1696/06; 1696A/06; 19269/06.

"We therefore beg to give notice to manufacturers, sellers, and users of cars embodying these patented inventions, that we are prepared to entertain applications for licences on fair and reasonable terms, but that it is our intention to take a vigorous action against those infringers, manufacturers, sellers, and users, who refuse to respect our patents and patent rights.

"The secretary will forward copies of standard licences as already accepted by leading manufacturers in England, and copies of specifications of any of the above patents on application.—Faithfully yours,

"The Mercedes Daimler Motor Company, Ltd.

"1, Broad Street Place, Finsbury Circus, E.C."

MR. A. H. S. ATHERDEN writes recommending a motor-car instructor who has given him every satisfaction and whose merits he wishes others to know.

THE FINEST AUTOMOBILE RIDE IN THE WORLD.

THE title is true, remarks Mr. O. L. Halsey in our American contemporary, "The Automobile." There are just fourteen miles of it, but those fourteen miles yield more interest and more indelible impressions than any other fourteen miles of road extant. This is the St. Gothard Pass, in the Alps. It forms a part of the most direct route between Como and Lake Lucerne. It crosses the mountain range whose name it bears, and whose highest peak, the famous Galenstock, rises nearly thirteen thousand feet. The pass itself reaches an altitude of 10,000 feet, being anywhere from one to four thousand feet higher than the more recently constructed railway pass and tunnel underneath. Some geographical specifications seemingly would insure the pass of St. Gothard to be a famous and well-patronised motor highway. The contrary is true. The average automobilist, whether home-spun European or imported American, avoids the pass of St. Gothard. It is a road for the daring, and its charms, that are visible from every turn of the road, are well worth the venture.

We were touring Europe in our Packard "Thirty" when we came to the pass. Its grandeur and its difficulties were recounted to us. We decided in favour of the grandeur, and learned that touring Europe in a motor-car is one thing of which a ride through St. Gothard Pass is not a part, but another and bigger thing. At the entrance is Airolo, a typical cluster of chalets, plus hospice and railway station. We

Touring in Bosnia.

- 3.—The Pass near Duare.
- 4.—A nasty corner near Bocac.

reached there late in the afternoon, and learned that automobiles may venture on St. Gothard Pass only in the evening and early morning. To be exact, they are allowed on the pass between five and seven p.m. and six and eight a.m. The better part of the permitted two hours is required to make the journey.

We went that evening. With a strange apprehension that was almost timidity we looked up from beautiful Airolo into the snow-coated mountain peaks that hid all but the first few turns of the wonderful pass. Then we started from summer into winter; from a temperature of 82 degrees to a temperature of 10 degrees; from pleasant, comfortable touring into difficult, uncertain, and dangerous mountain scaling; from a prettily set village into stern heights where mere prettiness would be an insult to the view's magnificent proportions indescriptive in words. When this pass was built for the moving of armies, no other purpose was taken into consideration. Seldom is it wide enough to allow the safe passage of two vehicles. In many places one vehicle has a narrow and precarious footing on the mountain-side. For miles it is possible to look over the side of the car, down perpendicular rock walls, to snake-like torrents of melted snow one or two thousand feet below. There is no wall on the outer edge of the pass, the greatest precaution for safety being a slight kerb, five or six inches high. Sometimes the road slants downwardly toward the outside.

The prompt ascent after passing the guard-house necessitates learning a new kind of motor driving. The steep grade is a succession of

sharp, narrow turns. Some of these angles were so acute that it was impossible to turn them without stopping and backing the car. As we progressed we learned to negotiate these turns somewhat more easily by swinging just at the right point and just inside of a corner where the pass ended and a vertical precipice began. All the time it was steady, hard climbing on second speed. The motor settled down to an unquivering gait, and there was no break in the even progress except an occasional acceleration at the acute turns where it was necessary to increase speed in order to make them without changing gear.

We were awed by the dangerous character of the road; by the natural respect which the mountains themselves commanded, and by the occasional glimpse of the ubiquitous Swiss bayonet, thrust over a stone wall or a pile of rocks. In the St. Gothard Pass you are always between two evils. You must not stay in the pass more than your allotted two hours, and you must not exceed certain speeds to get out of it in that time. However, you are not angry at restrictions. The road is dangerous enough when you are the only traveller on it. It is no place for meeting other automobiles. The man behind the bayonet never speaks, and you do not answer. Sign language is sufficient. We, in the climbing car, did not even talk to one another. There are some places where conversation is profanation. This is one of the places.

The echoing blast of an Alpine horn put us in a quiver. It meant the approach of a skidding stage coach descending with wheels locked. We took no chances in passing vehicles on that road. Fortunately there is little other traffic than the mail coaches, a few local carts travelling short distances, and, in the lower altitudes, herds of sheep. Once we shot down a sharp and unexpected decline to find ourselves headed for a small black hole in the face of an immense expanse of rock. There was just room to steer the car into it clear of the walls. Daylight was snapped out in the infinite blackness. We were scared, but we did not light the lamps. For what seemed a day, and probably was a quarter of an hour, we drove through this winding tunnel, guided only by the reverberation of the trilling motor against the rock. When at last we left the streak of night, we found the winding shelf illuminated by the mellow lights of evening. Again we climbed, climbed, and climbed up the mountain wall. It was cold, and we huddled together in the car. We ran through snow, blown in icy sheets against our faces. Looking upward, the pass was faintly and more faintly marked at each successive turn it took along the mountain. It seemed an unending journey to the peak above, and when that goal was reached we saw again the zig-zag pathway to the next.

The wonderful background of lurid fires where the sun sank behind the glistening snow caps; the devious road disappearing in the subdued colours of cloud-toned twilight; the great solitude—all of it was awesome, fascinating, overwhelming. Tensely silent, we rode to the highest point. There the strain was broken by the marvellous beauty of the panorama spread at our feet. We stopped and clambered out of the car for a last look over the valleys and peaks, snow drifts and glaciers, rivers and villages, passes and tunnels of this Alpine region as pictured from the turrets of Galenstock. For an hour we had not spoken. We were chilled to the bone. There had been no sound except the ceaseless purring of the motor. Our farewell glance upon the scene was a lingering one. The winding four-mile descent to Andermatt was begun reluctantly. Once on the way, however, we slid and scrambled down the shelf as fast as we could without going over its side. That was the hardest job of steering I ever have done. It was a case of 100 per cent. accuracy, because there was no allowance at any place along the twisting road for the mistake of an inch.

Afterward we continued our tour through Europe (some 6,000 miles altogether), but that, to me, is always another story. Whenever I think of those fourteen miles on St. Gothard Pass I immediately forget all of the other motoring which I have done in deep appreciation of the wonders of this finest of all motor rides there are in the whole wide world.

"POLICE CONTROLS."

THE police have a measured furlong in the Coombe Lane, at Wimbledon, as well as the regular traps in Parkside and in the Morden Road.

THE police in the Leyton district have measured a furlong on the High Road, along which the drivers of motor-buses are being timed almost every day. Drivers of cars, too, should be wary, or they will be trapped.

FROM the Columbia Lubricating Company, of New York, comes a little pamphlet which indicates that the concern makes a speciality of motor lubricating oil, which is being well appreciated by leading motorists on both sides of the Atlantic.

MR. J. WINTLE, who has been with the Daimler Motor Company, Ltd., for the past seven and a half years, the latter period of which he has held an important position in the sales department at Coventry, has resigned his position to join the Sheffield-Simplex Motor Works, Ltd., to take up a high appointment in their sales department.

IN consequence of the increased quantities of E.I.C. magnetos now being supplied by the Electric Ignition Company, Ltd., of Birmingham, the company have been able to considerably lower the works costs. They have consequently decided to reduce the retail price for four-cylinder machines by 25 per cent. All E.I.C. magnetos are guaranteed for two years.

CLUBS AND ASSOCIATIONS.

THE AUTO-CYCLE UNION.

THE sixth annual dinner of the Auto-Cycle Union was held at the Waldorf Hotel, Aldwych, W.C., on Saturday last. H.S.H. Prince Francis of Teck, chairman of the Royal Automobile Club, presided, and among those present were Mr. Robert Todd, chairman of the Auto-Cycle Union; Col. H. C. L. Holden, Sir R. K. Arbuthnot, R.N., Messrs. E. A. Lamb, Mervyn O'Gorman, Lyons-Sampson, Julian W. Orde, Stenson Cooke, A. V. Ebbelwhite, A. J. Wilson, C. A. Smith, treasurer of the Union; and F. Straight, secretary.

After the loyal toasts, the Chairman, in proposing "The Auto-Cycle Union," touched on the history of the motor-cycle, and said that if one had mentioned to the rider of the old boneshaker that the day would come when an appliance could be fitted to the bicycle whereby the rider, without effort, would be carried up hill and down dale, the idea would have been pooh-poohed. Yet this had come to pass, and there were now 55,000 auto-cycles on the road. He was pleased to note that our exports had surpassed the imports, which was a tribute to the work of the British manufacturer. He characterised motor-cycling as a really healthy pastime, and one to be encouraged. Should he call the motor-cycle the younger brother of the motor-car? Speaking as a younger brother, he felt it suffered under a disadvantage, as younger brothers did, that whenever, as rarely chanced, a motor-cycle encountered a motor-car, it had to go to the wall—or over it. The Auto-Cycle Union helped its members greatly in matters of legal importance, and it strove effectively to check undesirable methods of driving. They were repressing inconsiderate drivers, even as the Royal Automobile Club was doing. During its short existence the Auto-Cycle Union had achieved a record to be proud of. It was united in the true sense of that term and was doing *bona-fide* good work, hence its future would be brighter even than its past. Last year there were 371 individual members of the Union, and, with the affiliated clubs, there was an aggregate of 2,198.

In acknowledging the toast, Mr. Todd, the chairman of the Union, observed that the presence of their chairman that night furnished yet another proof of his whole-hearted and practical interest in all forms of automobilism. He was proud to be able to announce that that afternoon three more provincial auto-cycle clubs had joined the Union, and also that the Union had discussed at its council meeting a proposal to organise a body or bodies of motor-cyclists to be at the disposal of the military authorities in time of need. It had decided to further consider that scheme; and he sincerely trusted that the War Office would welcome it. As to the sporting phase of the movement, despite the fact that it seemed to be something of a heresy to speak of racing on the high road at the present time, he sincerely hoped that there would be a Tourist Trophy Auto-cycle Race in the Isle of Man this year. The motor-cycle would also be in evidence at the Easter Brooklands Race Meeting.

"The R.A.C. and Affiliated Clubs" was proposed by Mr. Mervyn O'Gorman, who said that the motor-cycle was at the root of the genealogical tree of motoring, the late Gottlieb Daimler's first machine being a three-wheeler. The original competition rules for motor-cycling were also a strong element in the competition rules of motor racing, not only in England but over the whole world.

Mr. J. W. Orde, secretary of the R.A.C., who responded, spoke of the work which the Union did and the necessity for united action. He remarked that he sincerely hoped the A.C.U. would not let the Tourist Trophy race drop, and he could assure them of a welcome by the Manx people. The toast of "The Chairman" was given by Colonel H. C. L. Holden.

In addition to the presentation of the trophies won during the past season, and a collection for the widow of Police-constable Tyler, an excellent musical programme was also rendered during the evening, which, thanks to the efforts of the secretary, Mr. Straight, passed off most successfully.

Mr. Robert Todd presided over a council meeting of the Auto-cycle Union at the Waldorf Hotel, London, on Saturday afternoon. There were about forty delegates. The meeting lasted a little over two hours, most of the time being taken up with discussion on the local centre scheme. The provisional rules drafted by the committee of the union were subjected to many propositions of alteration and amendment, but none of them was of great importance, and, in spite of a speech by the delegate from Cambridge University M.C.C. for its rejection, the amended scheme was adopted.

It was proposed by Mr. H. C. Pickering, of the Worcestershire M.C.C.,—"That the Auto-cycle Union should consider the advisability of formulating a scheme for the placing at the disposal of the military authorities a large number of motor-cyclists, for use in the event of a great national danger." The proposition was carried.

A speed limit inquiry has been held with regard to an application for a ten-mile limit up Stanmore Hill. The A.C.U., considering that motor-cyclists could not go up the hill at such a low speed, instructed a member of its committee to give evidence to that effect.

BROOKLANDS.

THE programme which has been issued in connection with the Brooklands Automobile Racing Club's Easter Meet on April 10th and 12th contains some supplementary regulations, which we set forth somewhat fully as likely to be of interest to all who follow the sporting events during the year.

Several new features have been introduced in these, and a fine of \$5 will be inflicted on those entrants whose vehicles fail to take part in the races for which they are entered, unless prior notification of likely absence is made to the clerk of the course.

"Weight" is the minimum weight of the vehicle ready for the race, and includes the driver, mechanic, fuel, tools, and all appliances. In "weighing in" an allowance not exceeding 5 lb. per mile of the race may be claimed for fuel, lubricants, and water consumed.

The metal disc on which the number of the vehicle appears, and which is located behind the driver's seat, is to be provided and fixed by the entrant, and it is also provided that every driver or mechanic taking part in any race shall be a male person unless the race proposition expressly states otherwise.

An important regulation is that with regard to pulling up at the completion of a race. Every driver is expected to apply his brakes and shut off power immediately on passing the Finishing Line. He will then be required to bear towards the near edge of the track, endeavouring to reduce his speed to between twenty and thirty miles per hour prior to reaching the left hand bend connecting the Finishing Straight with the main track. A broad black line, commencing in the last fifty yards of the pull-up leading into the main track is painted on the concrete and known as the Limit Line. This is not to be crossed by drivers when pulling up. The driver having reached the main track is to continue to decrease speed until crossing another black line, known as the stopping line. Any driver coming to a stand prior to having passed the stopping line will be disqualified. After passing this drivers will turn in at the gate and so leave the track.

NOTTINGHAMSHIRE.

THE ninth annual meeting of the Nottinghamshire A.C. was held at the Victoria Station Hotel, Nottingham, on the 28th ult. Mr. Charles Hardy presided and expressed regret at the coming severance of his close association with the club. He proposed Lieut. Col. R. L. Birken as his successor. This was seconded by Mr. A. N. Lee and carried with animation. Mr. Booth Granger presented his annual report, recording the chief events of the year and mentioning that twenty-nine members had been elected, while resignation and death accounted for the loss of twenty-nine. The total membership is now 203. The report and accounts having been adopted the retiring vice-presidents were re-elected, Mr. Charles Hardy and Mr. C. Cowes being added to the list. The ballot for ten members of the committee resulted in the election of Messrs. J. P. Smith, P. L. Huskinson, R. L. Jones, H. D. Bayley, M. R. Browne, W. D. Foster, A. N. Lee, R. A. Young, H. Bircumshaw, and H. Belcher.

Messrs. C. Perry, G. E. Butcher, J. H. Southorn, and A. Osborne were re-appointed hon. timekeepers, Messrs. R. Hutchinson, jun., and H. H. Bowden hon. auditors, and C. E. W. Lucas hon. solicitor. The latter, in reply, said that it spoke a good deal that during the last two years there had not been a single case concerning any member of the club.

A discussion ensued upon a suggestion to reduce the subscription, and ultimately it was agreed to request the committee to consider the matter.

THE HARTLEPOOLS.

INTEREST in the Hartlepoons A.C. is growing apace. The annual dinner was held last week under very favourable auspices, Mr. Geo. Jones, J.P. (president) being in the chair. Amongst those present were the Mayor of West Hartlepool (Coun. Johnson), Major Tomkins, and Messrs. J. Nattras and Toy (Stockton A.C.).

In submitting "The Club" His Worship the Mayor, who was enthusiastically "tootled" with motor-horns, said the club deserved to prosper, because its members were such a good-hearted lot of people. Motors, he proceeded, had come to stay, and they would travel over the valleys and plains until they were perhaps displaced by aeroplanes.

Mr. W. S. Merryweather, J.P., spoke of the dangers of travelling too rapidly round corners, and contended that if motorists gave more attention to things like that motoring would become more popular.

Major Tomkins (chairman of the Stockton A.C.) said the Hartlepoons motorists had a reputation for carefulness in driving. Sometimes, however, they were not particular about railway gates, but they always managed to get through them.

Mr. C. Smith (chairman of the club) said that during the past year the members had been endeavouring in some way to combat the prejudice against motorists and motor-cars. The prejudice was no doubt caused in many instances by reckless driving. They had formed a driving committee, composed of one or two motor-cyclists, some of their own committee, and last, but not least, their police force. Through the North Eastern Association they were associates of the Royal A.C. and also affiliated members of the M.U. Referring to the Driving Committee, he said it was their duty to report any case of inconsiderate driving. If the charge was proved the offender was either expelled from the club or severely reprimanded. That would tend to show, he remarked in conclusion, that the club were opposed to reckless driving either by the members or other motorists in the district, and would do more good than the old-fashioned police-trap.

The secretary (Mr. H. E. Pyman) reported that the club had nearly forty members, and was in every way in a sound position.

COVENTRY MOTOR CLUB.

THE Coventry Motor Club are organising a petition with a view to safeguarding all road users, especially at night, with regard to cattle on the road. It seems quite unreasonable, they say, that vehicles under control, such as motor-cars, cycles, and carriages, should carry lights, while herds of cattle should be driven in darkness, to the danger not only of other road users, but also of the cattle.

BEDFORDSHIRE.

ON Monday the Bedfordshire A.C. held their annual dinner at Luton, when between sixty and seventy took part in a pleasant gathering. There was a good attendance of public men in the county and the speeches bore tribute to the increasing care with which cars are being driven.

YORKSHIRE CHAUFFEURS.

THE recently-formed Yorkshire Chauffeurs' Association has held another successful meeting at the Marquis of Granby Hotel, Lowerhead Road, Leeds, when representatives from Morley, Bradford, and Pontefract were elected members of the committee. Mr. E. Ellett, the hon. secretary, was in the chair, and explained that some time in June a competition for members would probably be organised, which should not only prove popular with the public, but also give them some assurance of the ability to drive shown by members of the Yorkshire Chauffeurs' Association.

ESSEX MOTOR BOAT CLUB.

AT a concert promoted by the Essex Motor Boat Club at the Nore Yacht Club House, Southend, a few days ago, the Vice-Commodore, Mr. W. G. Tabet, presided, and the Mayor of Southend, who is the Commodore of the Nore Yacht Club, referred to the advantage that was gained by the latter in allowing the Essex Motor Boat Club to have its headquarters on their premises.

SCOTTISH.

SIR J. H. A. MACDONALD, Lord Justice-Clerk of Scotland and president of the Scottish A.C., took the chair at the annual dinner in Glasgow on Tuesday night. Among the three hundred members and guests who attended were Prince Francis of Teck, Lord Dunedin, the Lord Provost of Glasgow, the Moderator of the Church of Scotland, Sir Samuel Chisholm, Messrs. Robert Balfour, M.P., H. A. Watt, M.P., John Adam, J. Orde, W. McKillop, M.P., J. R. Nisbet, Colonel Bennett, and R. J. Smith (secretary).

Lord Dunedin proposed the toast of "Automobilism," remarking that in the old days probably the function of the Club was to introduce a budding pastime to a large public which did not know much about it; he now regarded the Club to be an intermediary between automobilists on the one hand and the general public and the authorities on the other. There were two sides to the question. No man ought ever to go out for a drive without reflecting that he might be a nuisance. After all, one had a great deal of sympathy with the local authorities in the matter of roads, for there was no doubt that the roads were being subjected through automobilism to an amount of wear and tear that they were never subjected to before. Speaking generally, he did not suppose that any of them would mind an increased payment to help the roads.

Prince Francis of Teck, in replying to the toast, expressed the pleasure it gave him to be present, because he knew what yeoman service the Scottish Automobile Club had accomplished in the past for the good of automobilism. Automobilists claimed to stand in a very firm and solid position. The affiliation scheme had produced a body of gentlemen 14,000 strong who were thoroughly versed and cognisant of the movement, united under one head and working through the various districts for the great advance of the movement, and for its greater good. Whereas in 1905 the registered cars numbered somewhere about 65,000, now they numbered 157,000. The export of cars, valued at £3,000,000 sterling, nearly equalled the imports. They had 55,000 motor-cycles running on the road, and the export trade amounted to 57,000 machines. It therefore behoved them to reflect that they played a very important part in the trade life of the country. Some few months ago he regretted to think they must admit that the automobile was not the most popular creature that crept God's earth. That unpopularity was decreasing, and he thought with care and with due cognisance they might in a short period be able to place themselves in the position once more of being popular, because he thought it had come home to all those who were driving that unwholesome recklessness with regard to other users of the King's highway would not be allowed by all right thinking people. It was all very well on the straight roads of France or Germany, where they could see twelve miles ahead, but here there was a limit and there were corners.

Sir J. H. Macdonald, President of the Club, also replied, urging that automobilists should compile statistics disproving that the motor-car imperilled the safety of the community. Most of the accidents were due to persons who took no reasonable care of their own safety.

SCOTTISH MOTOR TRADE ASSOCIATION.

THE dinner held annually in connection with the Scottish Motor Trade Association, and in conjunction with the Motor Exhibition in the Waverley Market, Edinburgh, took place in the North British Station Hotel, Edinburgh.

Mr. Thomas Shaw, Dundee, the president of the Association, was in the chair. The company numbered 250, and included several gentlemen

prominently associated with the motor organisations and the motor industry. Messrs. W. L. Sleight, Edinburgh, and J. H. Paterson, Aberdeen, acted as croupiers.

Sir John Macdonald, proposing the toast of the evening, the Scottish Motor Trade Association, said he was beginning to feel rather a veteran in the cause of motoring. After recalling some of the incidents of the thousand miles reliability trial of 1900, Sir John said nobody who took part in that event, only nine years ago, could have believed that any such meeting as this would take place at this time. In 1900 there was not a single agent dealing with cars or a manufacturer making them in that city. As regards their Show, he was quite convinced that if there were any gentlemen who had thought it would be as well that there should be no exhibition except that in London, they were now convinced that they were in error. If pressure had been put on to stop the Edinburgh show it could not, he was sure, have been stopped, and pressure would not have been favourable to the exhibition at Olympia.

THE Mansions Motor Garage Company has been added to the R.A.C.'s list of officially appointed motor schools.

BOTH the Bury and West Suffolk and the Halifax Automobile Clubs have resolved to become associated with the Royal A.C.

MR. ARTHUR CALEY has been elected president of the Lancashire A.C.

THE Roads Improvement Association, Ltd., have asked Col. R. E. Crompton and Mr. Rees Jeffreys to write papers on their behalf for the forthcoming road conference to be held in London by the County Councils' Association on April 28th and 29th and May 1st.

LIEUT.-COL. W. A. JUPP has been appointed secretary of the Motor Yacht Club and will live on board the "Enchantress." A house dinner is being held on the boat to-day (Saturday).

MAJOR H. S. STREATFIELD, J.P., will preside at the annual dinner of the North Eastern A.A. at Newcastle on the 5th inst.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

WITH a capital of £30,000 in £1 shares and offices at Cumberland Park, Willesden Junction, London, N.W., Iris Cars, Ltd., has been registered.

THE Long Acre Autocar Company, Ltd., has been registered with a capital of £3,000 in £1 shares.

HUMBER, LTD.—The shareholders of Humber, Ltd., at the adjourned annual meeting at Coventry on Monday, approved the reconstruction scheme submitted by the investigation committee, of which Lord Russell was chairman. Lord Russell said the committee were unanimous that the company's affairs were by no means in so bad a position as necessity for reconstruction appeared to indicate. The amount produced by the new scheme would be £120,000, which would be sufficient to set the company firmly on its legs, and put it in a good position. Shareholders had an opportunity of keeping alive a magnificent property and they would have value for money invested. Mr. Edward Powell, chairman of directors, who presided, strongly advised the shareholders to keep up this magnificent business, although under the present scheme he retired from the board altogether. He gathered that the policy of the new board would be in some respects such as he would not be in accord with, and it was necessary that there should be harmony. Some months ago he intimated to his colleagues that for personal reasons he intended retiring from the managing directorship. The business amply justified the call for the additional capital asked for, and it only needed energetic and capable management to secure highly satisfactory results. After a short discussion the committee's scheme was approved.

DUNLOP PNEUMATIC TYRE.—A meeting of the Dunlop Pneumatic Tyre Company was held on Monday to consider "agreements granting to a new company, to be called the Dunlop Rubber Company (Far East) (Ltd.), the exclusive right to manufacture in or import into Japan and other parts of Asia east of Burma cycle and motor tyres and rubber goods, under the name of 'Dunlop' or other names used by this company, and to take shares in such company when formed." The resolution was carried.

BUSINESS NEWS.

MESSRS. J. KEELE, LTD., have been appointed London agents for the Rota detachable wheels of the Coventry Detachable Wheel Company, Ltd.

FROM the Nathan Novelty Manufacturing Company, of Reade Street, New York, comes a copy of their catalogue of motor accessories, which include tyre trunks, hood covers, storm aprons, lamp covers, tool rolls, &c.

WE learn from Messrs. Clement-Talbot, Ltd., that the Talbot cars on view at the Edinburgh Show last week were of 12-h.p., 15-h.p. and 25-h.p.

THE County Chemical Company, Ltd., are opening a new carbide store at Rosebery Place, Kingsland, N.E.

STERNOIL was used by H. V. Colver in making the six hours' motor cycle record on the Canning Town Track last week. He covered 270 miles 1,170 yards.

MESSRS. SAMUEL BROTHERS, LTD., the well-known tailors of Ludgate Hill, London, E.C., are introducing a new style of motoring gloves fashioned on the lines of fingerless mittens.

AUTOMOBILE ACCIDENTS.

RETURNS have been compiled by the Automobile Association of accidents in which motor-cars were concerned during the last few months. The appended details cover the period between November 14th, 1908, and January 23rd, 1909. The figures show that out of a total of thirty-eight fatalities from accidents in which the motor vehicle was more or less directly concerned during ten weeks, in no fewer than twenty-eight cases the drivers of the cars involved in the accidents have been completely exonerated by juries. In five cases no details are to hand as to the result of coroners' enquiries, and in only three cases have the drivers been committed for trial.

The records of accidents not attended by fatal consequences are also of great interest. It is well to point out that the injuries to members of the public for the week ending December 20th include two cases in which pedestrians were walking in the road at night, and one case in which a motor-car was overturned, three persons being injured. Included in the figures for the week ending January 2nd are two persons injured while travelling in a skidding motor-omnibus; eight persons were reported as injured in similar manner during the week to January 10th, and four persons were injured from the same cause during the week January 23rd.

FATALITIES.

Period November 14th to January 23rd (ten weeks).

| Week Ending. | Fatalities to Motorists. | Fatalities to Public. | Results—where known—of inquests and Trials of Drivers |
|--------------|--------------------------|-----------------------|---|
| Nov. 21 | 0 | 4 | All drivers exonerated and verdicts of accidental death returned. |
| Nov. 28 | 1 | 8 | Six verdicts of accidental death and drivers exonerated from blame. One driver committed for trial. One verdict not reported. |
| Dec. 5 | 1 | 0 | Skidding car, motorist thrown out and killed. |
| Dec. 12 | 1 | 3 | Two drivers completely exonerated, one simple verdict of accidental death. One verdict not reported. |
| Dec. 19 | 0 | 1 | Verdict of accidental death and exoneration of driver. |
| Dec. 26 | 0 | 6 | Five verdicts of accidental death, with, in two cases, complete exoneration of drivers reported. One verdict not reported in press. |
| Jan. 2 | 1 | 5 | Three drivers exonerated from blame. Two drivers committed for trial. |
| Jan. 9 | 0 | 3 | All drivers exonerated from blame by juries. |
| Jan. 16 | 0 | 3 | All drivers exonerated from blame by juries. |
| Jan. 23 | 0 | 1 | Boy killed by motor trolley. Verdict not yet reported. |
| Total. | 4 | 34 | |

ACCIDENTS.

Period November 14th, 1908, to January 23rd, 1909 (ten weeks).

| Week Ending. | No. of Accidents. | Accidents resulting in no Injuries. | Injuries to Motorists. | Injuries to Public. |
|--------------|-------------------|-------------------------------------|------------------------|---------------------|
| Nov. 21 | 11 | 0 | 6 | 8 |
| Nov. 28 | 17 | 5 | 8 | 12 |
| Dec. 5 | 11 | 6 | 0 | 5 |
| Dec. 12 | 9 | 3 | 1 | 5 |
| Dec. 19 | 18 | 4 | 5 | 12 |
| Dec. 26 | 20 | 5 | 14 | 11 |
| Jan. 2 | 11 | 6 | 2 | 4 |
| Jan. 9 | 15 | 4 | 6 | 12 |
| Jan. 16 | 14 | 4 | 4 | 14 |
| Jan. 23 | 7 | 3 | 3 | 5 |
| Totals | 133 | 40 | 49 | 88 |

THE danger incurred by the practice of one motor-car being employed to tow another was illustrated at the coroner's inquiry into the death of Robert Lovell, 45, a motor fitter, of Clapham Road, S. W. According to the evidence, Lovell was in the motor-car which was being towed. The first motor-car turned across the tramlines to enter a garage, but stuck at the entrance, leaving the second motor-car partly on the tramway. A tram-car dashed into it, and Lovell was thrown under it and injured, subsequently dying in St. Thomas's Hospital. The Rev. Herbert Shepherd, who was in the tramcar and saw the accident, said that the vehicle was being driven very slowly; and the driver also deposed that the two motor-cars came right across the track and gave him no time to pull up. Other evidence was given of a somewhat contradictory character, and finally the jury returned a verdict of "Accidental death."

AT Runcom on Monday evening a motor-car belonging to Mr. Lloyd Jones, of Liverpool, fell into the Manchester Ship Canal. The car

brushed aside the protecting chain of the transporter bridge, and, as the transporter car was not in dock, leapt over the edge and, turning a somersault, dropped on its side, into about three feet of water. The driver, Frank Pilling, fell underneath the car. Fortunately, the tide was in, or the shore would have been dry. The occupants were the owner, who escaped with a shaking and wetting, and Mr. Bolton, of Liverpool, who was severely bruised and is suffering from shock. The driver had his head cut and his ribs badly bruised. He explains that he did not know the district, and seeing the light of the transporter car, which was approaching the side, he thought he was on the right road.

A NEW DRILLING MACHINE.

MESSRS. DRUMMOND BROS., LTD., of Ryde's Hill, Guildford, have, as is well known, specialised on machines and tools for automobile makers and repairers. They have brought out several excellent devices for increasing the efficiency of motor-car plant, and in making a study of the practical requirements of those who are interested in the automobile industry the firm have done well. One of their newest appliances is the Sensitive Radial Drilling Machine, shown in the accompanying illustration. This has been designed to fulfil the requirements of motor repairers. At the same time, it will also prove serviceable for general shop use. The large bed is of the heavy box form, while the provision of side slotted wings makes the drilling of large and awkward pieces easy. It is mounted on heavy standards planed to fit planed surfaces on the bed, and the heavy fly-wheel is

mounted on anti-friction rollers, complete with treadle, and fast and loose pulley on the fly-wheel spindle for the power drive. The radial arm is of extra stiff construction, and is raised or lowered by a new patented form of steel spiral working into a steel cut rack. It can be swung at any angle between 120 deg. and locked in position, and carries a back-gear travelling head, moved along the arm by a steel cut rack, steel pinion, and polished hand wheel. The steel spindle, running in a gun-metal bushed steel raising and lowering sleeve, is actuated by the hand wheel. It is fitted with a Westcott's Little Giant triple grip drill chuck.

The tool can be driven by either foot or power. Hitherto there have been difficulties attending the design of foot-driven drilling machines, owing to the great exertion required to drive. In the new machine which Messrs. Drummond, Ltd., are placing upon the market 1-in. holes can be drilled at a speed of about six minutes per inch in cast iron without previously using a small drill. Considerably larger holes than 1-in. can easily be machined with a pin iron, and for smaller drills this new Sensitive Radial Drilling Machine will do extremely fast work, the treadle work being exceedingly light for such operations.

Messrs. Drummond Bros., Ltd., claim that the reason for the increased range and capacity of their appliance consists in their new patented form of simple direct drive, with a very light belt at high speed. This drive goes direct to the bevel wheels, which have ball thrusts, and the back-gearing between them and the spindle for heavy work. Another point of advantage is in the anti-friction roller drive to the fly-wheel, with direct simple connection to the treadle. Structural points of importance are in the rigidity, stability, and weight of the standards and bed of the machine, the merits of which should lead to its adoption in many of the leading motor repair shops of the country.

CASES AGAINST MOTORISTS.

WARNING MOTORISTS OF TRAPS.

On the 28th ult. Mr. E. J. Robertson, living at Westhill, Wandsworth, answered at the South Western (London) police court to a summons charging him with unlawfully obstructing Constables Welton and Langley in the execution of their duty. Mr. Muskett (Messrs. Wontner) prosecuted on behalf of the Police Commissioner, and Earl Russell defended in the interests of the Motor Union.

The proceedings, said Mr. Muskett, had been taken under section 2 of the Prevention of Crimes Amendment Act, which made it unlawful for anyone to resist or obstruct the police in their duty. On December 26th three police officers were specially employed in Portsmouth Road, Putney, to test the speed of motor-cars on measured furlongs. The defendant rode up on a bicycle, and, having dismounted, kept the constables under close observation. Two motor-cyclists were observed some distance away, and as they entered the measured furlong at a speed estimated by Constable Welton at thirty miles an hour, the defendant shouted to them, "Stop, stop; you are in a trap." The riders slowed down and passed out of the furlong at a speed which would have been useless to place under test. The defendant then rode out of the "control," and gave warning to the drivers of at least twelve motor-cars, all approaching the furlong at a great speed. The officers, finding their functions useless, shifted their observation. The defendant followed, however, and signalled to other cars in a similar fashion. The officers were consequently unable to carry out their duties. The defendant, when taxed with obstructing the officers, admitted shouting, but denied doing so for the purposes suggested. This was not an isolated instance, continued Mr. Muskett, for the same kind of obstruction was being carried on throughout the country by employees of motor associations, though he was bound to say that, so far as he could ascertain, the defendant himself was not so engaged.

Constable Welton gave evidence as to the conduct of the defendant, and the further investigation was adjourned for a week.

EXCEEDING LEGAL LIMIT.

Mr. Edward Manser, of Sanderstead, was summoned at the Wimbledon Police Court for exceeding the legal limit in the Coombe Lane, Wimbledon. A lady who was in the car at the time said she was watching the speedometer practically the whole of the journey and over the measured furlong it recorded only eighteen miles an hour. Ultimately the Bench were divided in their views and the summons was dismissed.

ALLEGED DANGEROUS DRIVING.

At Chelmsford, Basil Rayner has been fined £5 and costs for dangerously driving a motor-car in Broomfield Road in that town. It was alleged that he had driven at a speed of thirty miles an hour from one side of the road to the other. His defence was that he had driven on the wrong side of the road in order to avoid splashing foot passengers on the pathway. A denial of the speed alleged by the police was also made.

On the 28th ult., at Bradford Brook Butterfield, a motor-car driver was summoned for driving his vehicle to the danger of the public. He collided with a wagon, the impact being so severe as to throw himself into the road, while his passengers were in such a condition as the result of their injuries that they were unable to attend the court. The Bench said that the case was one of the most serious they had had before them and imposed a fine of £10 and costs, or, as an alternative, nine months' imprisonment.

MOTOR-CAR AS AN OBSTRUCTION.

At the Wilmslow Sessions Cyril Tatham, of Wilmslow Park, has been summoned for causing an obstruction on the highway. Sergeant Leigh said he was in the Hough district, when he found a motor-car unattended and across the road, the whole of the highway, he said, being blocked

with the exception of about six feet. He watched the car for fifty minutes, and saw several vehicles come up. In one case a horse would not pass, and vehicles had to go on to the grass in order to pass. The defendant then drove up in a motor-car, and said he had had to leave his car because he had run short of petrol. The Bench fined him 10s. and costs.

ROAD REPORTS.

HAMPSHIRE—Among the county roads under repair are those on Hartford Bridge Flats; between Otterbourne and Chandler's Ford, on the Winchester-Southampton Road; and on the Botley and Bishop's Waltham main road near the station at the former place.

RYDE (I.O.W.)—Metal has lately been spread on the following roads:—Newport road to Osborne College, Newport road to Ryde, Newport to Sandown road, via Arreton and Apse Heath. The total length of metal to be spread in the Bembridge district is 550 yards, and about 200 yards in the Godshill district. It is intended to repair the road from Godshill to Whitwell and Inton, also Bembridge Village and Taverland. These repairs will be in progress during February and March, but the roller will be used directly upon the metal, so that, unless motorists approach while the work is in progress, little inconvenience will be experienced.

DUBLIN—The County Surveyor of Dublin recently asked the North Dublin District Council to allocate the sum of £11,200 for the maintenance of the roads, &c., during the current year, this being an advance of nearly £800 on last year's estimate, the necessity for which was said to be increased motor traffic. After discussion, however, the amount was fixed at the same figure as in 1908.

GROOMS BECOMING CHAUFFEURS.

In Putney there is a Coachmen and Grooms' Club, which held its seventeenth annual dinner last week, at the Railway Hotel, Putney. From a membership of 130 there was an attendance of ninety-five. The toast of the club was proposed by Mr. Stamper, who remarked that since he first joined the club many changes had taken place. He hardly knew some of his old friends in a pair of motor goggles and motor cap. But they were still the same old friends, and they were glad to have them. And if motor-cars were coming in they must have the motor men.

Mr. Walters, in responding to the toast, said that as one who had been connected with the club for a good many years he also saw the changes indicated by the chairman. When he first joined the club there were forty-five members; two years ago they numbered 150. Since then their numbers had dwindled to 130. That was on account of the increasing number of motor men. Still, he was pleased to say several motor men were connected with the club. He had urged upon the members the necessity of devoting their attention to the motor trade, and if they did not the club would become a thing of the past.

MOTORISTS ORGANISING AT NEWARK.

MEETINGS of local motorists have been held at Newark, when it was agreed that a local motoring organisation was much needed. It was further resolved that it should take the form of a branch of the Motor Union, to be called "The Newark and District Centre of the Motor Union of Great Britain and Ireland." A representative committee has been appointed to protect the interests of motorists in the district. Lord Walter Hervey is the president, the vice-presi-

dents being the Right Rev. the Lord Bishop of Southwell, Mr. L. N. Barrow, J.P., Mr. T. Craven, J.P., and Mr. T. F. Warwick. Mr. W. Mumby, J.P., is the chairman of the committee, of which Mr. J. Mather, Castlegate, Newark, is the secretary. Among the members of the committee are two County Councillors, Messrs. J. C. Fisher and C. J. Huskinson.

MANCHESTER MOTOR SHOW.

WITH reference to the Motor Show which the directors of the Manchester and District Motor Trades Association are organising at Belle Vue from the 19th to the 27th of the present month, we understand that practically the whole of the space originally intended to be let has been allotted. A considerable extension of this area is now contemplated to meet the demands of those who have not already taken space.

PUBLIC SERVICES.

ON the motor-cabs which the Urban Taxicabs, Ltd., of 20, Avonmore Road, West Kensington, are putting upon the streets of London a new device has been adopted to facilitate the passenger communicating with the driver. This consists of a sliding panel in the upper part of the window behind the driver, giving an aperture sufficient to enable the passenger within to speak to the driver on the box.

THE Provincial Motor-cab Company, Ltd., have now a number of taxi-cabs plying for hire in Birmingham. They are 18-25-h.p. Siddeley cars, and may be engaged at the usual rates. The headquarters of the company are at Five Ways Garage, Ladywood, and the local manager is Mr. Cecil Harris.

FORTHCOMING EVENTS.

FEBRUARY.

- 6th (S.).—Cambridge University M.C.C. Petrol Consumption Trial.
- 12th (F.).—Annual Dinner of the British Motor Boat Club.
- 19th (F.).—27th (S.).—Manchester Motor Show at Belle Vue, Manchester.
- 20th (S.).—First Annual Dinner of the Sutton Coldfield A.C.
- 22nd (M.).—Manchester A.C. Dinner.
- 25th (Th.).—Irish A.C. Annual Meeting.
- 26th (F.).—Hull A.C. Annual Meeting.
- 26th (F.).—Annual Meeting of the Motor Yacht Club.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
- 18th (Th.).—Royal A.C. Annual Meeting, followed by Annual Dinner at the Covent Garden Theatre.
- 20th (S.).—27th (S.).—Cordingley's fourteenth Annual Motor-Car Exhibition and Mart and third Aero Show at the Agricultural Hall, London, N.

APRIL.

- 10th & 12th.—Easter Meeting at Brooklands.
- 24th (S.).—Auto-Cycle Union's Quarterly Trial.
- 29th-30th.—Road Conference in London of the County Councils Association.

MAY.

- 26th-June 1st.—Irish Reliability Trials.
- 31st (M.).—Whitsuntide Meet at Brooklands.

JUNE.

- 10th-18th.—Prince Henry Trophy.
- 14th-19th.—Scottish Reliability Trial.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, FEBRUARY 13, 1909.

[No. 519.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE old brigade of motorists—those who journeyed forth from Whitehall Court, London, on the social excursions which the A.C.G.B.I. organised in the days when motor-cars were regarded with curiosity, will remember the jaunts over Salisbury Plain. Ten years ago—at Easter—the club had a tour, reaching Reading the first evening and Salisbury on the following evening. It was a gallant procession, led by Mr. F. H. Butler on

his 5-h.p. double-cylinder Benz dogcart, with the Hon. J. Scott Montagu, M.P., Mr. J. R. Hargreaves, Dr. Porter, and Mr. Ernest Estcourt on Daimler cars, ourselves on an Iveagh phaeton of the M.M.C. type, Dr. Acworth on a motor-tricycle, Mr. and Mrs. J. A. Koosens on their famous Lutzmann, Mr. and Mrs. Buttemer on the Benz Ideal, Mr. J. Lyons Sampson on a Benz Victoria of 5-h.p.; others on steam wagonettes and electric carriages; and the Rt. Hon. J. H. A. Macdonald, K.C.B., Mr. Roger Wallace, Mr. Worby Beaumont, Mr. Staplee Firth, the late Mr. Andrew Barr and a few others who have since become famous in the motor world. It was a notable party that assembled at Stonehenge and traversed Salisbury Plain. By a curious coincidence Mr. F. H. Butler is again associated with this great tract of country, the War Office having communicated with him and the Aero Club agreeing to allow experiments with regard to aeronautical matters to be held on War Department land. Mr. Butler is naturally gratified at this encouragement, and declares that a series of aviation trials will be held on Salisbury Plain in the summer. And so the district which has been famous in national annals since the days of the Druids, and which is so pleasantly associated with the early adventures of motorists in this country, will probably be identified with the next line of advance, the ascent of man into the air.

A well-mannered Hog.

A REAL hog was the cause of an appeal case heard in the Courts on Monday, which enabled three learned judges to disclose a great knowledge of porcine manners. On a fine afternoon in August, 1907, a motorist was driving a car on the high road from Truro to Newquay. At the same time a sow left the restricted area of a farmyard to take a walk abroad. It did so openly, in broad daylight, for all the world to see. There was no clandestine intention—just a harmless little outing which threatened no ill to any one. Arrived at the cross-roads, the pig sat down to rest awhile, although one witness averred that the animal “sat up on her haunches.” The car and the sow having arrived on the scene a horse attached to a cart came along from another direction, and took fright at the sight of the resting wanderer from the sty. To avoid a collision with the cart the motorist turned his car to one side, struck a wall and got the worst of the encounter. Then he sued the farmer who owned the pig in respect of the damage to the automobile. The case was so complicated and the decision of the judge at Bodmin Assizes so inconclusive that the defendant appealed. The appeal case was concluded on Monday, seventeen months after the sow frightened the horse that nearly collided with the car that struck

the wall that damaged the car on the highway in Cornwall. It has now been held that the farmer was not liable, upon the ground that, even assuming that the pig was improperly on the highway, the negligence of the defendant, if any, of allowing the pig to be there was not the direct cause of the damage, which was caused by the horse shying in the cart. In bringing actions it is as well to go down to the root of the matter. In this case the hog was not to blame, and, as Lord Justice Moulton observed, “the pig got up the moment the motor horn was sounded, as a well-behaved pig should do.”

Our Flying Progress.

ALTHOUGH our title is “The Motor-Car Journal,” attention may well be drawn to the sub-title on the familiar front page, “a medium for all interested in self-propelled traffic,” to which might now appropriately be added “by land, sea, or air.” We are led to this reflection by an interesting comparison which a loyal reader has made in the letter appearing in our correspondence columns. He has voiced an impression that is rightly abroad that the *M.C.J.*, taking no merely terrestrial or lowly view of its contents, has flown upwards and now chronicles the movement for aerial navigation more completely than any other journal. Even those that are specially devoted to the subject lack that comprehensive collection of news which appears in our columns week by week, and it is evident that those engaged in actual experimental work are now looking to our columns for the record of progress.

A Roll of Honour.

THE decision of the Lancashire A.C. to establish a roll of honour is a good one, and should do something to assist in the development of a proper pride in club life. Now that the avenues of organised activity on the part of motorists have been so greatly curtailed there is a difficulty in many districts in replacing the natural resignations by death, removal and the like. Anything that tends to establish a kind of local patriotism in club affairs is to be welcomed; and the proposal of Mr. Hodson, of Preston, to the Lancashire automobilists was promptly endorsed. Of course, there are vice-presidencies to offer, but such offices generally carry an amount of activity. The new distinction is similar to the freedom of municipalities, and should be as jealously guarded. There are a few to whom such distinction might be suitably offered, if it were already in existence in their clubs, and of these the names of a worthy couple in contiguous counties occur as we write, viz., Messrs. Charles Hardy (Nottinghamshire), and Godfrey Lowe (Lincolnshire).

Motor-car Imports and Exports.

THE reputation for quietness which last year obtained as regards the importation of foreign-built motor-cars and parts into this country is fully maintained in the returns now available for the first month of 1909, the total of cars, chassis and parts only amounting to £229,628 as compared with £251,287 in January, 1908. The arrivals of complete cars numbered 177, of a value of £60,316; 286 chassis estimated at £73,310 were also received, to which have to be added motor-car parts to the extent of £96,052. As regards the British export trade in motor-

cars, the returns available show that this branch is also still affected by the general depression in trade, the value of the aggregate shipments during last month only having amounted to £94,370 as contrasted with £107,152 in January last year. Altogether 166 complete cars were sent out of this country, of an estimated value of £60,942. The number of chassis exported was 18 (£5,867) while parts were responsible for a further £27,561.

Scotland and Tramcars.

MORE prompt than the Local Government Board for England, the Secretary of Scotland has already issued an amending Order to the Motor Car Act in connection with the passing of tramcars by motorists. The effect of this is to prevent the former regulation of 1904 from being so interpreted as to impose a rigid requirement on a motor-car overtaking a tramcar to keep to the right or off side of the same. The new Order provides expressly that the term carriage "shall not include a tramway car or any other vehicle which runs on affixed roads," but this of course does not relieve the driver from his liability in the common law, or under Section 1 of the Motor Car Act, 1903. It will still be the duty of drivers to exercise the utmost caution in overtaking and passing tramcars.

Rural Preparations for Automobile Tourists.

From a sketch in

Collier's Weekly.

Lights on Vehicles.

ON another page we give an interesting summary of the bye-laws and exemptions which have been sanctioned in connection with the Lights on Vehicles Act, 1907. A perusal of this list will show that motorists have yet much to do to educate the authorities to a universal recognition of their duty with regard to warnings as to the presence of other vehicles on the road. They might also take into consideration the question of lights to indicate the presence of cattle as well.

Actors on the move.

THE theatrical profession generally has always shown active interest in motoring matters, and there is scarcely an artiste of repute who has not become an ardent motorist. But for the use of the motor-car many of those now performing on the variety stage would find their evenings much more irksome than is actually the case. Now we hear of the automobile being used in a wider sphere and one which will probably cause some lamentation in the circles of Lord Claude Hamilton and other railway chairmen, who have often publicly referred to the effect that motor vehicles have had upon railway traffic. In connection with

a tour of Mr. Henry Arthur Jones's company, "Dolly Reforming Herself," which has been played for some time in London, the motor car is to be used to enable the company to travel from town to town. In the larger cities and boroughs a week's stay has often resulted in a profitable venture for theatrical companies, but there are many smaller places where the patrons of the player might be exhausted in two or three nights. In such cases the advantage of the motor-car is easily apparent, for the company will be able to give two or three performances and then travel on to the next town. A tour on such lines is already being mapped out. Not only will the actors themselves travel by motor-car, but scenery specially adapted for transport by motor vehicles is now being prepared and painted.

Joint Work.

THE joint meeting of the British Motor Boat, the Motor Yacht, the Essex Motor Boat, and the Sussex Motor Yacht Clubs, which was held in London a few days ago, suggests a course of procedure which might well be adopted from time to time by those responsible for the organisation of the motor movement on land, and, it might now be added, in the air as well. Representatives of these four bodies met to decide upon a calendar for the racing season of 1909, and to fix dates which, though still subject to the confirmation of the Racing Committees of the individual organisations, have been decided with a view to avoid that clashing which has sometimes led to the comparative failure of what would otherwise have been successful meets of motor bodies.

The Setting of Traps.

OFTEN are complaints being made in the southern counties with regard to the police being taken from their ordinary and legitimate duties in order to trap motorists on the highway. From time to time discussions by local authorities have drawn attention to the dangers of the continuance of this practice, and at last those directly responsible are considering taking action to meet the agreements. It is reported that in Sussex the question is now exercising the minds of some of the Standing Joint Committees as to whether they will have to appoint special staffs for the timing of motor vehicles and the heavy office duty arising where any considerable number of prosecutions have been undertaken. In view of the increase of traffic which is expected this spring, and the fact that the total fines have proved so remunerative to the authorities, it is just possible that something on these lines may be attempted. But why cannot the police constables of the South take a leaf out of the books of their confreres of Manchester, Salford and Cheshire, and decline to include "trapping" as part of their duty?

The Scottish Trial.

price, as follows:—

| | | |
|----|--------------------------------------|-----|
| A— | Vehicles not exceeding £200 | |
| B— | Vehicles over £200 and not over £250 | |
| C— | " " 250 | 325 |
| D— | " " 325 | 425 |
| E— | " " 425 | 525 |
| F— | " " 525 | 650 |
| G— | " " 650 | 800 |
| H— | " " 800 | |

For the Classes A and B the entrance fee will be £18 and for the other categories £25. Entries will be received after the code of conditions has been issued, and not later than April 30th. Vehicles will be required to be fitted with touring bodies standard to the make of car. A very complete and detailed specification will be insisted upon, in order to satisfy the Club that the entry is in exact conformity with the corresponding vehicle listed and sold by the entrant, and that it is standard in every respect. No

boring or lightening of frames will be permitted, and the marks for hill-climbing and fuel consumption forming bases for medal awards will be reduced from those formerly given, and special marks given for hill-climbing results in each class.

The L.G.B. and Speed Limit.

WE understand that some of the organisations which have been formed with the apparent result of harassing motorists and embittering the relations which now exist between them and the public are communicating with local authorities advocating that, in the event of local authorities applying for a reduced speed limit, application should be granted provisionally until good reason is shown that the reduced speed limit ought not to remain in force. This was communicated to the Southwick (Sussex) Urban Council a few evenings ago, and it was decided to support such a suggestion. The impartial man, however, will probably recognise a preposterous claim that is made by such a proposal. The present method of obtaining a speed limit has of course its objections, but, so far, it has worked fairly well, and the fact that so many refusals of

the Act were taken, and that convictions resulted in 91 per cent. of those cases. The deputation, Mr. Shuttleworth, in moving the report of the Main Roads and Bridges Committee at last week's meeting of the County Council, reported, were surprised to find a much fuller application of the law than they had reason to believe was the case, and that such an active attempt was being made to deal with the difficulty. If the public would realise the frequency as well as the severity of prosecutions against motorists, they would have more sympathy with a patient and long-suffering section of our people.

The Trial of Headlights.

APPARENTLY a hitch has occurred with regard to the proposed trial of head lights which is favoured by owners of cars and wanted by the Royal A.C. At the last meeting of the Expert and Technical Committee of the Club a letter was read from the Society of Motor Manufacturers and Traders, whose Accessory Committee had come to the conclusion that such a test would not be likely to benefit either the trade or the public. They felt that the conditions under which it was proposed to hold the

Motoring in Ceylon.—A 35-45-h.p. Mandalay Car travelling round Kandy Lake.

applications from local authorities have been made suggests that many of them are of a futile and unnecessary character. To grant a provisional speed limit without enquiry would simply be to encourage practically all the local councils to send applications through their county authorities without reason at all, and once imposed such restrictions would not be likely to be taken off.

91 per cent. of Convictions.

SOME time, filled with a strong sense of public duty, the Main Roads and Bridges Committee of the Lancashire County Council considered the annoyance that they felt was caused to the long-suffering public by motor-cars on the highways. So keenly did they feel upon the matter that they appointed a deputation to wait upon the Standing Joint Committee to urge the desirability of taking more frequent proceedings under the Motor Car Act. They accordingly presented such a view to the authorities—apparently, however, with little effect, for the committee have since been informed by the Chief Constable that during the three years ended September 30th, 1908, 145 cases of driving to the danger of the public, 251 cases of exceeding the speed limit of twenty miles an hour, and 244 cases for other offences under

test did not give a fair comparative result, and further they were opposed to any action which might have a tendency to establish a monopoly for any one manufacturer. We understand that a conference is to be held between the Technical Committee of the R.A.C. and those lamp makers and agents who are members of the Society on the subject.

MESSRS. SMITH AND WESBY are opening a fully-equipped motor garage in grounds adjoining the King's Head Hotel and Railway Station at Saxmundham. For the past few years they have been engaged in repair work for Messrs Mann and Egerton, of Norwich, and intend to give special attention to breakdown cases. Cars for hire and fully qualified drivers will also be available for visitors to the district.

FROM Eyquem's Patents, of 31, Duke Street, E.C., come particulars of the several patterns of sparking plugs they are marketing. The firm have also taken up the sale of the "Silicia" accumulators for ignition purposes, which are claimed to have many advantages. Other specialities of the firm include the "Fast-neezie" motor corset, a useful device for temporarily protecting the inner tube of a tyre should a burst occur in the outer cover.

HOW THEY DO IT IN AMERICA.

BY CHAS. Y. KNIGHT.

THE American motorist, accustomed as he is to the most drastic treatment at the hands of the police, naturally looks upon his English cousin as having quite an easy time. But the American motorist does not always submit tamely

What happened when the Glencoe Bumps were first introduced.

to the minions of the law. One reason for this is the fact that various rural communities have seen fit to employ for constable work youths who could not earn a penny in an honest vocation. Naturally motorists resented being held up by the scum of society, and in turn the rural communities objected to having their toy policemen treated with contempt.

In one instance, in a suburb north of the city of Chicago, one of these "toy" policemen, failing to stop a motorist through the raising of an un-uniformed arm, punctured a rear tyre with a bullet from an official revolver, and incidentally narrowly missed shooting a lady in the tonneau of the car. The rural community exonerated the "toy" policeman, but the motorist did not. In a few days a car loaded with several burly young men passed through the same village at a speed in excess of the legal limit. Mr. "Toy" Policeman raised his arm in command to stop, which was done. Then, as is customary, he stepped upon the running board of the "captured" car and ordered his captives to the police station. Here is where the worm turned, and the persecuted turned upon the persecutor. Mr. "Toy" Policeman was quickly thrown into the tonneau, the car accelerated and steered for the open country, where Mr. "Policeman" was dropped "twenty-five miles from nowhere."

The next move upon the part of the Rural Community was to give the "toy" policeman aid of most substantial character. "The Glencoe Bumps"—now famous in American motor literature—were constructed. They comprised footpaths across the main road, built of brick, rising about four inches from the ground in the centre, being cambered to the outer edges. The first illustration gives an idea of what happened to the first motorist who attempted to cross these paths at above eight miles

an hour. Many springs were broken, and passengers thrown from the car, the first week.

Then the motorists got wise. They consulted spring specialists and had their cars equipped with supplementary springs which were guaranteed to take these bumps at a speed of thirty-five miles per hour. The second illustration (which, like the other, is reproduced from the "Daimler Bulletin") shows a car approaching one of these bumps at this speed. Needless to say, the feat was successfully accomplished, and the motorists scored once more.

If English motorists consider themselves badly treated by the authorities, they should investigate some samples of American rural justice. Four mile limits through villages of a hundred souls are not uncommon, and when the country constables go out for victims, four miles an hour means four miles an hour and not five or even four and a half; and, as far as the motorist's evidence is concerned, it is wholly a waste of breath. He does better to plead guilty to the heinous crime, confess himself to be a wicked criminal, throw himself upon the mercy of the court and plead for liberty.

Contradicting the evidence of the police is regarded by the rural judge as a defiance of the properly constituted authorities, and penalties are inflicted accordingly.

In America, as in England, however, the problem will settle itself in time; when the people as a whole recognise the fact that mechanical locomotion is a settled fact the majority will embrace instead of repel it, and reason and justice in place of prejudice and persecution will prevail. While it may not seem possible, it is nevertheless a fact that the English motorist enjoys great liberty as compared with his American cousin in the matter of speed, and one can hardly imagine a community in England wilfully obstructing a main road with dangerous raised cross-walks throughout the entire length of the village.

PROPERTY owners, builders, and estate agents in Kent are reaping the benefit of progressive road treatment and fairer

Taking the Glencoe Bumps at Thirty-five Miles per Hour.

police methods which prevail in the county. In the favoured outlying residential districts it is a difficult matter to secure a modern residence, and those with a garage attached are snatched up as soon as vacated. A Kent firm of estate agents informed a correspondent that during the past month they had disposed of house property to motor owners now residing at Kingston, Barnes and Richmond, and such instances can no doubt be multiplied.

GOSSIP FROM PARIS.

Wilbur Wright at Pau.

Wilbur Wright has set to work again; his flights at Port Long attract every day large crowds of the cosmopolitan visitors who throng Pau at this season of the year. He acts as methodically in training his pupils as he did in training himself when he arrived in France to commence flying after an interruption of his experiments during three years and more. If the King of the Aviators wanted practice to recover his marvellous skill, it is not astonishing that his pupils, even with his coaching, should not get on the machine and fly right away over the tops of trees and houses. One of the most experienced French aviators said to me last week the world should not be surprised if Wright's pupils came to the ground more than once before gaining mastery of the aeroplane. Making the comparison between Wright's machine and the French aeroplanes of the biplane types used till now by Farman, Delagrangé, Antoinette, Moore-Brabazon, &c., he said the latter are the tricycles of the air and the former the bicycle. Any man, if he is only careful, can get on a tricycle and ride it without much danger, but he must have a considerable amount of practice before he can feel safe on a bicycle. When one has thoroughly mastered the art of balancing one's self on a bicycle the movements become so natural that they are made almost unconsciously and the rider in the end feels as at home on it as he does on foot. It will probably be the same with the Wright aeroplane, but beware of the preliminary falls! That is why my French friend does not think either Comte Lambert or M. Clemenceau will be able to compete successfully for the Monaco prize. "No," he added, by way of conclusion, "it is true the Wright Brothers' machine is, in my opinion, the only one in France with which the conditions of the Monaco competition could be fulfilled. But I do not believe a fortnight's training will, as he seems to think, enable M. Clemenceau to accomplish the feat."

An Aeroplane Competition at Rheims.

The Aviation Grand Prix is to be held in August or the beginning of September on the Plain of Betheny, near Rheims, where the grand review of 150,000 French soldiers was passed by the Czar in 1901. The spot is well chosen, as the vast expanse of flat land will enable the spectators to keep the aeroplanes in sight along the whole circuit of over six miles. It is also well selected on account of its geographical position near Paris, Belgium, Switzerland, and Germany. The programme of the week's fetes will not be published till after it has been approved by the Commission Aérienne Mixte at its meeting on the 17th inst. The money prize of the Grand Prix is £4,000, but the exact nature of the performance required to win it is not yet officially known. There will be numerous other prizes for achievements of minor importance. This great international event, which will certainly attract enormous crowds, especially if the weather is propitious, is the outcome of Henry Farman's daring cross-country flight from Bouy to Rheims. The feat raised such enthusiasm among the inhabitants of the whole district that a local committee, with the Marquis de Polignac as president and M. Roul de Bary, Mayor of Rheims, as vice-president, was soon formed to organise a great aviation fete. In a couple of weeks the subscriptions for it amounted to £6,000. In presence of that fact and of the undeniable advantages offered by the vast expanses of the Chalons Camp, and of the comparatively flat land round Rheims, the C.A.M. unhesitatingly took the enterprise under its patronage. A member of that committee told me he expected a good many foreign aviators would compete, and in reply to my questions concerning the nature of the competitions he said that, though nothing was definitely settled, he believed the Grand Prix would consist of a cross-country flight.

The Farman Aeroplane Factory.

Henry Farman has, in partnership with his brother, D. Farman, started manufacturing aeroplanes. On the premises the Farman Brothers have hired at Asnières there are already the incomplete skeletons of several new machines, and at their offices in Paris draughtsmen, under the direction of Henry Farman, are busily preparing the drawings of five other aeroplanes for which

orders have been received. However, far from abandoning his experimental work, the first three machines which will leave the improvised factory are destined to enable Henry Farman to continue it at the Camp de Chalons, where he has constructed three sheds to receive them. Two of those new machines are to be cellular biplanes with bearing surfaces measuring fifty square metres. The horizontal rudder will be placed in front at a considerably greater distance from the centre of gravity than that of his old aeroplane, and the steering gear in the small hind planes will be different from anything yet seen. An arrangement of "ailerons" will improve the lateral stability of these two machines. Each of them will be driven by a 50-h.p. motor acting on twin propellers working at about 400 revolutions a minute. The weight of the machines will be close on half a ton. The first of them will be completed by the first week in March. The third aeroplane is to be much smaller. It will not weigh more than 770 lbs. and will have a bearing surface of only thirty square metres. The machine will differ materially from the two larger aeroplanes and be provided with a quite new means of twisting the wings. For this machine Henry Farman will employ only one propeller, which will be driven by a 30-h.p. motor at a speed of 1,100 revolutions a minute. The inventor believes it will prove a very practical type of biplane, suitable for touring, because, in case of the aviator using it being forced by stress of weather to stop at a distance from his shed, it will be easily taken to pieces in ten minutes or

The Kapferer Aeroplane.

a quarter of an hour. Then the separate parts could be housed without difficulty in any shed or coach house.

Invasion by Airship.

Serious preparations are being made for the peaceable invasion of England by the air. Till now M. Clement and other owners of steerable balloons have been prevented from crossing the Channel on their airships by nothing but the want of a shelter on British soil. That difficulty will ere long be surmounted, as several people are negotiating for the erection of balloon sheds at various places on the English coast and also inland in the vicinity of London. Among them is M. Duhamel, the founder of the Aero Club Internationale de la Manche, of Havre, of which the object is, according to the articles of association, "to cement the amicable and commercial relations of France and England by the solution of the problem of the crossing of the Channel by steerable balloons and aeroplanes." One of the first ports for aerial vessels this association is seeking to create will be on the Isle of Wight, but negotiations have also been opened up with the authorities of Folkestone, Rye, Littlehampton, Hythe, Deal, Eastbourne and other places. Of course Havre is to be the headquarters of the enterprise, which aims at establishing a regular steerable balloon and aeroplane service for passengers if not for merchandise between Boulogne-sur-Mer and Folkestone or the vicinity. M. Duhamel regards the feasibility of the enterprise as "morally certain." Though it is pretty sure the Channel will be crossed more than once by steerable balloons and aeroplanes before the world is twelve months older, I am afraid the regularity of the service by aerial vessels would be interfered with by storms. MARNEY.

A PETROL MOTOR FIRE ENGINE FOR WILLESDEN.

THE latest town in the Metropolitan area to adopt motor fire apparatus is Willesden, where there has lately arrived a new self-propelled first-aid machine, comprising a chemical fire engine, hose tender and fire escape, built by Messrs. Merryweather and Sons, Greenwich. The motor is an extremely powerful one of 55-h.p., and the transmission is through a three-speed gear-box and side chains to the rear road wheels. The chemical cylinder holds 60 gallons, and delivers through 180 feet of rubber hose coiled on a hydraulic reel, arranged so that a jet can be discharged with the whole or any portion of the hose in coil. The fire escape, which can be detached in a few seconds, is of the "sliding carriage" pattern, and extends to a total height of 50 feet. The ladders are fitted with the steel tubular bow string girder truss, which adds greatly to their strength and rigidity without material increase in weight. A capacious box, fitted towards the rear of the vehicle, enables a large quantity of hose and fire brigade gear to be carried, and two hand "Kemiks" are provided for dealing with small outbreaks. The machine travelled by road from Greenwich to Willesden, the journey being accomplished in the smart time of forty minutes. It is capable of taking all the hills in the Willesden district on the top speed.

The new acquisition was not permitted to repose in the fire station very long before receiving its first call, and within a few days of its arrival the firemen effected a very smart performance in extinguishing a fire in the High Road, Kilburn, their efforts on this occasion meeting with very flattering comments from the District Council. A few days later, also, there was a call from Cricklewood. The motor covered the distance to the fire (a matter of two miles), the flames were extinguished by the two small hand "Kemiks," and a "stop" recorded in eleven minutes.

The accompanying illustration is from a photograph taken outside the Willesden Fire Station on the day of the motor's arrival, and shows the machine with a contingent of the fire brigade on board, and Superintendent Edwards, the energetic chief officer, at the steering wheel. As an evidence of the policy which the Willesden authorities have definitely decided to adopt, we understand that the new fire station which is shortly to be erected will be built without stables.

It is proposed to establish an aeroplane trial ground at Pen-en-Toul, near Vannes, France, Count Dillon having offered a large area of land for the purpose.

A GRAND aeronautical fête is to be held at Rheims, France, from August 22nd to September 13th next. The funds already amount to over £6,000.

SIGNBOARDS FOR AVIATORS.

THE increase in aerial traffic which may be expected in the near future has suggested to Herr von Frankenberg, of the German Aero Club, the advisability of arranging a system of signboards which will enable aeronauts to recognise their whereabouts without difficulty. His original proposal, which was to display the names of the place, province, and country in fifty positions in large white letters on a black ground, having been recognised to be impracticable, he has now worked out a scheme whereby Germany is divided up into ninety districts, each distinguished by a number, beginning with Berlin as No. 1. To each of the first twenty-five townships in the districts is allotted a letter of the alphabet; all smaller places are designated by combinations of two letters. Frontier places are to be distinguished in addition by coloured lines drawn above or below the numbers. Nothing seems yet to have been settled as to how

these signs are to be illuminated at night, or who is to pay for their upkeep. In France, M. Courtin-Rossignol, the Mayor of Orleans, has also taken the initiative of a somewhat similar measure. After unofficial negotiations, or, more correctly speaking, conversations with the recently created Aero Club of the town, and with the Juvisy Aviation Company, he is seriously contemplating marking out the best aerial route from Juvisy to Orleans. It is suggested that the best means to enable aviators to shape their course would be to erect high flagstaves at a distance of about two miles from one another. Each of them would bear two arrows, the one indicating the direction of Orleans, and the other the way to Juvisy. The route would traverse that part of the country on which the most convenient places for landing could be found in the case of the aviator being compelled, by accident or stress of weather, to come to the ground. The distance as the crow flies is about seventy-five miles, but the exact course

of this projected aerial highway is not yet fixed.

MR. OCTAVE CHANUTE, the "father of aviation in America," recently gave a lecture at the City Club in Chicago on "The Development and Practical Possibilities of Flying Machines."

SOME successful trials are reported to have been made at Mayence, Germany, with an aeroplane designed by Herr Hans Jorch. The apparatus is a two-decker, and the supporting surfaces are all slightly concave. A hollow body is fitted in the centre of the machine; behind, on both sides, there are curved wings, but the customary tail is lacking. The greatest length is 44 feet, and the greatest breadth 53 feet. It is claimed for the design that it will maintain its lateral equipoise automatically like a bird. The propelling power will be provided by two four-cylinder motors, each of from 35 to 40-h.p., and there will be two propellers.

The Willesden Motor Chemical Fire Engine and Escape.

AERONAUTICAL NOTES.

THE Upper Austrian Aero Union is the name of a new society which has just been formed at Linz.

LES AEROMOTEURS BELGES is the title of a company which has just been formed at Soignies with a capital of £8,000.

A NEW flying machine has lately been devised and patented by Mr. C. J. Davies, of Milford Haven. The machine is provided with supporting planes, and is propelled and raised by a screw propeller at the front of the machine and by vibrating wings.

It is now announced that M. Legagneux, and not Mr. Henry Farman, will visit Vienna to instruct the Syndicate which has purchased the Farman aeroplane in the method of operating the same. M. Legagneux is now at Chalons practising with the machine.

SEVERAL new and novel flying machines are in course of construction in the Lyons district. M. V. Mieusset, jun., is building a helicopter, which will be fitted with a 35-h.p. engine and three propellers. M. Monin is also constructing what he terms a gyroptere; this will comprise two large sustaining propellers of different diameters and rotating in opposite directions; the motive power will be supplied by an engine of 25-h.p.

MR. OLIVER K. CHANCE, of Minneapolis, U.S.A., is building a combination balloon, helicopter and aeroplane. According to the design a small saucer-shaped envelope filled with hydrogen supports some of the weight and aids in landing. A vertical mast extends through the centre of the bag, at the upper extremity of which is a propeller having a vertical axis. Below the bag is a framework containing the motor and three other propellers, whose axes are horizontal, which propel the apparatus forward, guided by a vertical rudder. There are also two rudders in front. The whole apparatus is heavier than the air it displaces.

It had to come sooner or later, and the wonder is that it has been so long delayed. We refer to the discovery of the "aeroplane face." This adornment has been discerned by a Frenchman, Professor de Prallo, who is described as a well-known phrenologist. The Professor points out the somewhat strange features of the new countenance, contrasting them with the peculiarities of the "bicycle face" and the "automobile face," but says that the aeroplane physiognomy differs from the others in all particulars. "It is noticeable in the Wright Brothers, Leon Delagrangé, Santos Dumont, and all other 'human birds,' except Farman, that their eyes are not exactly in front but more at an angle than normal, caused by 'the anxious sidelong glance' of the aviator."

SOME further details of the scheme for covering Germany with a system of airship services are now available. The engineers of the German Aero Station Company, which has been organised to carry out the plan, are stated to have already worked out designs for the halting places, which will each require an area of between seven and eight acres. At each station there will be three airship sheds, each 150 yards long, 15 yards broad, and 20 yards high, with special arrangements for ascending and landing. The Company is reported to have already selected suitable plots of ground in numerous towns, and, according to a statement issued, the establishment of a regular airship service between twenty-nine German towns may now be regarded as a certainty.

MR. ANDREW FLETCHER, of Saltoun, is reported to have placed an order for a Voisin aeroplane.

AN Algerian correspondent informs us that M. Ducos de Kouba, of that town, has ordered an aeroplane, with which he hopes shortly to make some experiments.

ON Thursday Mr. F. W. Lanchester was announced to give a paper on "Mechanical Flight" to the members of the Midland A.C. at the Grand Hotel, Birmingham.

FROM Marseilles comes the news that a new flying machine of the "helicoptere" type is being built by M. Ouyviere. The machine will be fitted with a motor of 80-h.p. and will weigh complete nearly 8 cwts.

THE Aero Club de Vichy is the name of a new association which has just been formed at Vichy. It has been practically decided to establish an aeroplane trial ground in the neighbourhood of this popular French inland resort.

ALTHOUGH not so much is heard of what is being done as regards aeroplane experiments in Germany as in France, there are quite a number of enthusiasts quietly at work in developing

their own particular ideas with regard to flying machines of the heavier than air type. At Magdeburg, Herr Grade is experimenting with a triplane weighing complete about three cwts. and having a supporting surface of 25 square metres. The motive power is supplied by a 36-h.p. six-cylinder engine which is stated to weigh only 3.3 lbs. per horse power. Professors Junkers and Reissner, of the Technical High School of Aix-la-Chapelle, have also built an experimental aeroplane, with which some trials are shortly to be carried out.

GREAT interest has been aroused in scientific circles in New York by the performance of Mr. M. O. Anthony, an electrical engineer, who successfully guided a small dirigible airship by means of wireless electricity. The experiment was conducted in a lofty ballroom, in the presence of a small company of guests. Mr. Anthony sat some distance from the balloon, and for upwards of two hours propelled it in all directions with dots and dashes flashed on the transmitting instrument and caught by the receivers fixed above the ballroom. Mr. Anthony is now building a full-size machine, for which he has taken out patents. He claims he has no longer any doubt as to his ability to supply the U.S. War

Department with airships which can be operated by wireless telegraphy at a distance of many miles.

THE supporting plane testing device at the works of Messrs. Voisin Freres, at Billancourt, near Paris, referred to in a recent issue, is actually a kind of balance, and consists of a huge wooden box, square in section, with sides of about 5 ft. in width, and it is open at both ends. At the bottom an electric fan renders it possible to produce a current of air at any required velocity through the opening. The surface or the combination of surfaces it is desired to test is then placed in front of the box to ascertain its sustaining power. The surfaces are supported by arms projecting from two frames, arranged on either side of the box, and which rests on floats in cylindrical vessels filled with water, constituting a scale beam. In carrying out the experiments, the surface to be tested being brought into position, the frame is caused, by weighting it, to assume a horizontal position, and then the blower is set to work. This forces the frame to twist round to a certain angle, and, from the amount of weight found necessary to restore it to the horizontal position, it is possible by a simple calculation to estimate the sustaining power of the whole surface.

When Aeroplanes replace Motor-Cars.—From a Sketch in the "Daily Mirror."

Aeronautical Notes—continued.

OUR Correspondence column has an interesting warning with regard to "the aerial companies which are almost certain to be launched in the future." The writer of the letter, Mr. H. V. Roe, of Manchester, is a brother of Mr. A. V. Roe, whose experiments are well known in this country.

A NEW aeroplane is about to be experimented with at Issy-les-Moulineaux by M. Lejeune. The apparatus, which was built by Messrs. Pischof and Koechlin, of Billancourt, has a bearing surface of 25 square metres, and is fitted with a Buchet three-cylinder engine of only 10-12-h.p.; the total weight of the machine is 385 lbs.

UNDER the auspices of the Aero Club of Belgium, a Nationale Aerial League is being formed, with headquarters in Brussels. Some friction appears to have arisen between the Belgian Aero and the Automobile Clubs, as to their respective official positions in the aeronautical world. The Aero Club claims the exclusive right to control all contests for the ensuing year, but the Automobile Club also contemplates organising aeroplane trials.

AT Ouistreham, near Caen, France, M. G. de Puisieux is making some experiments with a combination bicycle and flying machine. He is already stated to have lifted himself on the machine from the ground and flown a distance of nearly twenty yards. In connection with this subject it may be of interest to mention that one of the "turns" at the Coliseum, London, just now is M. Noiset on his flying bicycle, which, according to the announcements, "is a wonderful and startling novelty."

SOME discussion has arisen with regard to the comparison of the Aerial League of Great Britain with the Navy League—the one to advocate the command of the air for national purposes just as the other is advancing the claims of a strong navy for defensive reasons. Dr. A. Wallace, O.M., writes protesting against the assumption that the first and important use of aeroplanes and other flying machines and dirigible balloons will be to drop explosives or use other implements of destruction, in case of war, or as the first act of war.

M. HENRI FOURNIER is the latest French motorist to take up experiments with aeroplanes. He has had built a Voisin machine of the bi-plane type with which he hopes to compete at Monaco. The apparatus is being fitted with an Itala 50-h.p. engine of the standard automobile type except that it has been lightened as much as possible. The motor will drive the propeller through a reducing gear at a speed of from eleven hundred to twelve hundred revolutions per minute. Much interest is being shown in M. Fournier's departure, as, seeing that he weighs about fifteen stone, he must be classed amongst the heavy weights.

THOUGH there is no report of Mr. Wright going to Monaco to compete for the large money prizes offered there, M. Michel Clemenceau, who is interested in the selling of Wright aeroplanes in France, announces that he is forming a society at Cannes for the establishment of an aviation camp for two or three aeroplanes of the Wright type, which will be tuned up with a view to their competing. These will probably be steered by Count de Lambert and M. Michel Clemenceau. Early in March they hope to be able to compete at Monaco, as by that time the floating devices required by the regulations will have been fitted to the vessels. These "floaters" will take the form of cylinders of rubber-treated silk, filled with compressed air or gas.

MR. WILBUR WRIGHT and Mr. Orville Wright have promised to visit London at the end of next month. The visit will be made at the invitation of the Aeronautical Society of Great Britain, and at a special meeting of the society the brothers will each be presented with a gold medal in recognition of what they have accomplished for the science of aeronautics. It is expected that during their visit they will inspect the experimental ground of the society at Dagenham, Essex. Aeroplane sheds are in course of erection, and it is hoped to have an opening meeting in the middle of March, just before the opening of the Aeronautical Display in connection with the Motor Show at the Agricultural Hall, London. Among the new members of the society are Mrs. G. Bernard Shaw, Mrs. Edwin Mackintosh, Count G. N. Plunkett, Sir Charles Seely, and Colonel H. E. Tyler.

A NEW petrol motor for aeronautical purposes has recently been completed by M. J. Miesse, Brussels, the builder of the Miesse petrol cars. The engine comprises twelve cylinders, 110 mm. bore by 120 mm. stroke. At a speed of fifteen hundred revolutions per minute 120-h.p. is stated to be developed. The weight is given as only two hundred and three pounds or under 1.7 lbs. per horse power.

SOME time ago the Municipal Council of Paris gave a sum of £600 and the General Council of the Seine one of £200 to the French Ligue Nationale Aérienne as prizes for a competition of aeroplanes, to be held in the department of the Seine during the present year. The Technical Committee of the Ligue has now decided that the competition shall be held either at Issy-les-Moulineaux or at Vincennes, and shall be over a distance of ten kilometres, this having to be covered in less than fifteen minutes without touching the ground. The times and distances will be measured from the moment the apparatus is first in full flight. Each competitor will have the right to ascend several times, but on each occasion with a different aeroplane. Four prizes are being offered of respectively £400, £200, £140 and £60.

A NEW type of airship, capable of carrying 100 passengers, is, according to the "New York World," being constructed in the Lewis Nixon shipyard on Staten Island, U.S.A., to the designs of Mr. E. J. Pennington, who will be remembered by many in this country in connection with the automobile movement in the early days of the 1896 Act. A company has been formed to exploit the airship, and among the shareholders are a number of well-known capitalists. The principal innovation in the new airship is stated to be the elimination of gas bags and the substitution of a steel cigar-shaped buoyancy chamber, 700 ft. long, with a maximum diameter of 80 ft., and divided into a number of compartments. The vessel will be equipped with no less than eleven propellers; the main one is in front, five smaller ones being ranged on each side of the gas chamber.

BELIEVING that the progress made in aerial flight has already advanced to a level commensurate with the achievements attained 100 years ago by Robert Fulton with his first steamboat, the "New York World" announces that it will give a prize of £2,000 to the winner of an international airship Derby, to take place in October next, along the stretch of the Hudson made famous by Fulton when he startled the world by his first success in navigating the water with a steam-propelled craft. The competition, which will be held under the auspices of the Aero Club of America, will take place in connection with the Hudson-Fulton celebration. Our American contemporary, "Aeronautics," is also offering four prizes of the value of £10 each to the first four pilots who fly 500 metres in the presence of responsible witnesses. Only aviators who have not yet flown so far as this are eligible to compete.

WILBUR WRIGHT made his first flight at his new trial ground at Port Long, near Pau, on Wednesday last week; everything worked splendidly, and the aviator gave a fine display of his wonderful control over the machine, twisting and turning in every direction for about six minutes. After a short interval he made another ascent, keeping much higher in the air, and circling at a terrific speed right over the crowd of spectators. The machine is now fitted with a new engine, one result of which is that Wright is able to fly at a speed of about forty-three miles, or about three miles an hour faster than he achieved at Le Mans. On Friday M. Tissandier received his first lesson on the machine, he holding the lever while Wright took charge of the rudder. For some reason, however, the aeroplane did not leave the rail at a sufficient speed, and the rudder, coming in contact with the end section, was slightly damaged. The aeroplane was accordingly quickly brought to the ground, but without any mishap. In fact, the machine was out again on Saturday, when Wright flew some miles beyond the limits of the practice ground along the Pau-Bordeaux road. Afterwards with M. Tissandier on board he remained in the air for twenty-eight minutes. On Monday, before a large crowd of spectators, Wright made three further flights. After a first ascent alone he took up M. Tissandier, and during the twenty-eight minutes flew far away from the aviation ground. He afterwards made a third flight with Captain Gerardville.

CONTINENTAL NOTES.

A Light Car Trial in the South of France.

The Automobile Club of Nice is organising a reliability trial of light cars, tri-cars, and motor-cycles for April 19th, 20th, and 21st next. The only restriction with regard to the cars is that they must weigh less than 550 lbs. and carry two persons. The first day will be devoted to a twenty kilometre run over a hilly route; the second to a journey from Nice to Castellane and back *via* Puget-Théniers, a distance of 215 kilometres, and the third day to tests of flexibility and capacity to start easily on hills.

Motor-cabs in Berlin.

In connection with the regulation referred to in our last issue as having been issued by the police authorities of Berlin to the effect that no more licences for petrol motor-cabs will be granted, a meeting of motor-cab owners and representatives of firms inter-

Desvres. Saint Martin is within a mile of Boulogne, and the first side of the triangle crosses the forest of Boulogne. The road is undulating, but has a completely straight stretch of over six miles. From Alincethun to Desvres the route is both winding and undulating, but it is after passing Desvres that the cars will be put to the severest test. There is a hill with a gradient of 12 per cent., followed by a long undulating stretch preceding the famous Bainethun hill, a mile long, with a gradient of 9 per cent. As a slight compensation the drivers of the racing cars will find a mile and a quarter of perfectly straight road for the arrival back at Saint Martin. The entry list will remain open until May 31st next, the fee being £20 for one, £32 for two, and £40 for three cars.

Miscellaneous Items.

Two new Mercedes 55-h.p. landaulets have just been added to the automobile stud of the Kaiser.—There are now 380 motor-

A View on the Boulogne Circuit on which the Coupe des Voiturettes Contest is to be held.—The Village of Bainethun.

ested in supplying vehicles, as also accessories and supplies therefor, has just been held in the German capital, when it was resolved to petition the authorities to withdraw the regulation.

The Coupe des Voiturettes.

The Coupe des Voiturettes race organised by the "Auto" is to be contested over the Boulogne-sur-Mer circuit on June 20th. The entry list has just been opened, and it is already reported that it will comprise not less than fifteen English cars, including three each Humber, Vulcan, and Adams, two or three Stars, and one or two B.S.A. vehicles. Belgium, Germany, Switzerland, and Italy, and probably the United States, will be represented, so that it is certain there will be quite as many foreign cars as French. The "Auto" received no fewer than fifty-six proposals of circuits! So many of them offered almost equal advantages that it was no easy matter to choose between them. The Boulogne course, measuring twenty-five miles, was selected chiefly on account of its proximity to England. It forms a triangle, of which the apices are Saint Martin (La Fourche), Alincethun, and

cars registered in the city of Moscow.—Sr. Jose d'Aguiar has just made the journey from Lisbon to Paris, a distance of 403 miles, on an 8-h.p. single-cylinder car, in twenty-eight hours.

Les Vieilles Voitures.

Utilisation, non pas des vieux moteurs, mais des vieux "tacots." Un avisé Dijonnais fit l'acquisition, il y a quelque temps, d'une vieille voiture. Il remplaça la carrosserie arrière par une sorte de comptoir décoré de couleurs voyantes, puis, ayant réussi à mettre le moteur en marche, s'en fut sur une des places de Dijon vendre des glaces. "Glaces à la vanille! Glaces à la framboise!" s'écriait l'industriel marchand. Mais il n'eut guère besoin de s'égosiller, car la foule avait été attirée par la nouveauté de l'équipage. Est-il besoin d'ajouter que notre marchand de glaces fit de fructueuses affaires?

THE Eclipse Motor Company, of 86, High Road, Lee, S.E., have recently opened a garage, with separate lock-ups, pit, and the usual facilities, at 108, High Road, Lee, S.E.

THE GORE SELF-STARTING AND REVERSING PETROL ENGINE.

WE are able this week to give some particulars of an extremely interesting multi-cylinder petrol engine which has recently been devised and patented by Mr. Alexander Gore, of 21, New Bongate, Jedburgh, the special features of which are that not only can the direction of running be reversed, thus rendering a reversing gear, in the case of a motor-boat, unnecessary, but that the engine can be automatically set into operation. As will be seen from the part sectional elevation given herewith, the engine is provided with a small plunger pump *h* driven by a cam on the end of the crank shaft, and which forces air under pressure into the reservoir *k*. The latter is connected with the air inlet to the carburettor *n* by a pipe *l*, in which is a stop valve *o*. The air supply pipe *m* to the carburettor is fitted with a non-return valve *p*, so arranged as to allow air to pass into the carburettor from the atmosphere when the engine is working normally. The carburettor is connected with the inlet valve pocket *b'* of each cylinder in the ordinary way by means of suitable pipes.

The mechanically-operated inlet valves are of the usual

construction, and bear on seats formed in the valve chambers; they are retained on the seatings by springs *d* acting on the stems of the valves through the usual cup and cottar *e*. The stems of the valves, instead of sliding in the guides *b*, work in sleeves or pistons *c*, the latter being also arranged to slide in the guides. The sleeves *c* are each provided with four piston rings and with flanges *c'*, which operate as a stop by engaging the under face of the guides *b* to limit the upward movement of the sleeves.

The operation of starting the engine is as follows:—The stop valve *o* is momentarily opened, which allows compressed air to pass from the reservoir through the carburettor, where it takes up sufficient petrol vapour to form an explosive mixture, into the induction pipes and passages and thence into the cylinder, the inlet valve of which is open, and into the inlet valve pockets of the other three cylinders. The charge which passes through the open inlet valve pushes down the piston of that cylinder, so setting the engine in operation, if the ignition has previously been switched on. Owing to the peculiar method of mounting the inlet valves the pressure of the compressed air in the inlet valve pockets of the other cylinders cannot open the valves, as the pressure tending to lift the valves re-acts on the sleeves or pistons, so that the pressure on the valves is opposed by that

acting through the guide sleeves to keep the valves on their seats. In other words, the inlet valves are balanced, and therefore, notwithstanding the pressure of the compressed air in the valve pockets, the valves can only be opened by the cams *F* in the usual manner. After the piston of the cylinder, which had its inlet valve opened at the time the engine was started, reaches the forward end of its stroke, the inlet valve of one of the other cylinders opens and the compressed air rushes into the cylinder and drives its piston forward, and so on until the compressed charge in one of the cylinders is fired, which may, in some cases, be a charge left in when the engine was last stopped. When the motor is once in operation the compressed air valve *o* is closed, when the necessary air for the carburettor is drawn through the check valve *p*.

The other feature of the engine, that of its capability of running in either direction, is obtained by the mounting of two sets of cams for each of the inlet and exhaust valves and of so arranging the cam shafts that they can be moved laterally by means of suitable levers.

Among the claims made for the new motor are that it approximates very closely to a steam engine without the addition of any special valve gear; that there are no extra moving parts when the engine is working, except the air pump, for which a cut out is provided, and that by opening the compressed air valve *o* at any time a very material increase in the power of the engine can be instantly obtained for emergencies. In substantiation of his claims Mr. Gore sends us some details of the results he has obtained with a five-cylinder engine, 5 in. bore by 6 in. stroke, built in accordance with his design and fitted into a motor-boat, using neither clutch, gear-box, or flywheel. Working under atmospheric and forced induction the best results have been obtained with a receiver pressure of 300 lbs., reduced to 50 lbs. at the carburettor. The fuel consumption under atmospheric induction was 0.75 pint per h.p.; ditto, under forced induction, 0.52 pint per h.p.; the power absorbed by the compressor was 12-h.p. when working under forced induction. The actual power obtained at atmospheric induction at 1,000 revs. per minute with a compression pressure of 70 lbs. per square inch and an explosion pressure of 260 lbs. was 61.9-h.p. With forced induction and a receiver pressure of 300 lbs., reduced to 50 lbs. at the carburettor, 105 lbs. compression and an explosion pressure of 390 lbs. per square inch, the engine developed 127.85-h.p. at 1,000 revolutions per minute. Of this, 92.85-h.p. was due to the power stroke under forced induction, and about 35-h.p. to the induction stroke, which is, Mr. Gore points out, a power stroke at 50 lbs. per square inch. During the tests the cylinders were connected to a registering pressure gauge graduated to 1,500 lbs., using non-return valves to keep the gauge steady; eleven different propellers were used for absorbing the power, and the carburettor was an ordinary non-return valve type with adjustable feed.

MR. ALEXANDER WINTON, of the Winton Motor Carriage Company, of the United States, who was one of the American team in the Gordon Bennett race in Ireland, has suggested a new plan for automobile contests. According to this the maker would pay a 2,000 dol. entrance fee, securing the right to have cars of his make entered by owners of such cars willing to compete. The cars taking part would have to have previously run 3,000 miles in actual service, and the pooled entrance fees would be divided among the contestants.

THE Bridgwater Motor Company, Ltd., which has been associated with the industry from its early days, have issued an illustrated catalogue of their motor sundries, which should be of considerable use to the motorists of Somerset and the West of England who obtain supplies from this old-established house. Most of the accessories, which have been recently described and illustrated in our columns, can be obtained from the Bridgwater Motor Company, and in these cold days special mention may be made of the "Cosie" foot gloves of soft black or brown leather and wool lined, which are proving a comforting convenience to those who drive.

THE SOCIAL WHIRL.

NEW associates of the R.A.C. include Sir Walter Scott, Bart., Sir W. Cameron Gull, Bart., the Hon. W. H. Lascelles, and the Rev. W. Conybeare Bruce, M.A., the Archdeacon of Monmouth. The occupations of the last sixty candidates elected were extremely various, including the Principal of an art school, the proprietor of a poultry and fruit farm, a doctor of dental surgery, and an Oriental art dealer—as well as a score to whom the word “none” was officially applied.

CONGRATULATIONS to Dr. F. J. Furnival, one of the most famous octogenarians of the present time, on his eighty-fifth birthday. On Sundays he is generally to be found on the Thames with his Girls’ Sculling Club and on week-days he is generally in the British Museum. Many of his evenings are spent in the pleasant common room of the Working Men’s College which he helped Maurice, Tom Hughes, and others to found in 1854. For recreation he has since 1858 been engaged in pursuing words for the English Oxford Dictionary, of which he is the only original worker left. Dr. Furnival has compiled a list of motor terms and technical words which have lately come into use, and takes as much interest in ferreting out their meaning as in the Shakespearean studies which fascinated him in early days.

SIR JAMES CRICHTON-BROWNE, the president of the Sanitary Inspectors’ Association, was in the chair at the annual dinner of that organisation, held at the Gaiety Restaurant, London, on Saturday, and in his address urged that the advance of aeronautical inventions might involve an entirely new system of sanitary regulation. He pictured the time when taxi-balloons and twopenny aeroplanes arriving from the Continent every ten minutes would render us liable to invasion by hosts of undesirable alien microbes and to the introduction of all sorts of infectious diseases. The visible dust raised by motor-cars kept the nation sneezing, coughing and sniffing, and when these had subsided clouds of invisible dust hovered about.

MR. FRED KARNO, manager of the well-known music-hall companies of this name, drives a 40-h.p. Westinghouse. Mr. Grimani, their scenic artist, owns a 10-12-h.p. Lagonda tri car. Mr. Karno’s residence is at Loughborough, S.E., and the garage accommodates his own car and also the two powerful motor-buses owned and used by his London companies for travelling to and from the various halls at which he is engaged.

THE Rev. Dr. Darlington, president of the St. Mark’s Tramway Brotherhood, asks me to invite chauffeurs of motor-cabs to join with the tramway men in their Church Parade at St. Mark’s Church, Kennington, S.E., on the 21st, when a sermon will be preached by the Archbishop of Canterbury.

LAST week we had an interesting picture of a hunting party in the Rocky Mountains, in which a couple of motor-cars figured. Mr. Frederic Coleman has promptly recognised these as White steam cars. This certainly is a type of vehicle frequently met with in such locations in the United States, where its merits have had full appreciation from the President downwards.

THE Lincolnshire A.C. is now looking for a successor to Dr. Godfrey Lowe, who has given the club its present strong position among such organisations. The club has always done much on the social side, and has had the advantage of being associated with a county in which are many gentlemen’s seats as well as many gentlemen willing to allow their grounds to be invaded by cars. During last year the club was received at Grimsthorpe Park by permission of the Earl of Ancaster; at Syston Park by Sir John Thorold, Bart.; at Revesby Abbey by the Hon. R. Stanhope; at Monks Manor, Lincoln, by Col. J. S. Ruston; by the officers of two battalions of the Lincolnshire Regiment at Skegness; by Dr. Husband at Crowland, and by the Grimsby members at Cleethorpes.

LOLLIUS.

HERE AND THERE.

DURING the past three months fines totalling £600 have been imposed on motorists at the Kingston Police Court.

MESSRS. WILSON BROS., of Bedford, have introduced the motor taxi-cab into the town, and have also several motor-cars for hire after balls, dances, &c.

MR. ROBERT W. COAN is the president of the King’s Cross Philanthropic Society, and will take the chair at their concert at the Holborn Town Hall on the 24th inst.

AMONG the orders lately secured for six-cylinder cars by the Lanchester Motor Company, Ltd., is one from the Thakur Sahib of Rajkote and one from the Nawab of Rampur.

THE Public Health Committee of Edinburgh has decided to purchase another motor ambulance, and also to erect a garage with accommodation for four vehicles at the City Hospital.

MESSRS. STARK AND MURRAY have a motor-repair works and a garage for storing cars in Tower Street, Selkirk, where they are also able to stock petrol, &c., for motorists in that part of the world.

THE accompanying illustration depicts the new 16-h.p. Desmond car which has just been put on the market by the Desmond Motor Company, of Jordan Street, Liverpool. The vehicle is on up-to-date lines throughout, the engine being fitted with magneto ignition. The transmission is through a well-designed

three-speed gear-box and cardan shaft to a live axle. The Desmond Company are also building a 9-h.p. and a 12-h.p. car, both fitted with two-cylinder engines. They are being put on the market at prices which bring them well within the reach of motorists of moderate means.

MR. HUNTLEY WALKER, of Hayes, Kent, has written a letter to the Bromley (Kent) Urban Council offering to contribute towards the cost of a motor fire engine. Failing that he offers to present them with a horse.

THE Spalding Urban District Council has received its circular letter from the Road Union with regard to the Local Government Board breaking away from precedent in connection with the enquiries preceding the imposition of ten-mile limits, and, upon the recommendation of its Highway Committee, has resolved to do nothing in the matter.

It is reported that fifty petitions are being circulated throughout Prince Edward Island asking for the repeal of the Anti-Automobile Act. Not only are these petitions being largely signed by all classes of the community, but a special effort is being made to reach the farmers, and they are stated to be signing them in large numbers.

PROFESSOR B. HOPKINSON, of Cambridge, read a paper on the Effect of Size and Speed upon the Performance of an Internal Combustion Engine before the Incorporated Institution of Automobile Engineers on Wednesday. Professor Dugald Clerk presided. It was largely based on experiments with Siddeley and Daimler engines, the results being compared with similar researches with a Crossley gas engine.

Here and There—continued.

At the end of December, 1908, there were 8,790 horse-cabs and 2,923 motor-cabs in service in Paris, as compared with 9,608 and 1,465 respectively at the end of 1907.

MESSRS. PAGE BROTHERS have lately extended their motor garage and repairing establishment in Acre Lane, Brixton, S.W. The garage is open day and night, while all classes of repair work can be undertaken.

MR. T. HERSEY has a garage and motor-car hire business at Epsom, which is well known to all who travel that way. With the coming of the spring he hopes to continue the service to motorists he has rendered for some years past.

THE Coventry Motor Fittings Company, of Far Gosford Street, Coventry, have issued a new price list for 1909, which gives particulars of their latest types of lubricators, petrol fillers, exhaust silencers, fans, radiators, bonnets and other component parts.

MESSRS. A. WARRINGTON AND CO. have a good motor garage in the Grange Road, Birkenhead. This is fitted with an inspection pit, together with the Harvey Frost vulcanizing plant and everything else required for the efficient repair and overhaul of motor vehicles.

A Sheffield-Simplex Gear-box-less Car on Mow Cop, near Congleton.
The above illustration shows a Sheffield-Simplex Gear-box-less car ascending one of the steepest roads in the country, viz., Mow Cop, near Congleton, Cheshire, in which there is a gradient for a distance of approximately fifty yards of 1 in 31. Mr. W. S. Engall, who is seen at the wheel, is accompanied by Messrs. Hollingdrake and Hodgkinson, of the Hollingdrake Automobile Company. The gradient, we may say, is specified accurately, careful measurements having been taken.

THE Vulcan Engineering Company, of Barnes, S.W., is now known as the Elphick Engineering Company—an amalgamation having been effected. The repair of vehicles, charging of accumulators, and vulcanizing of tyres is done on the premises, which, so far as the garage portion is concerned, are open all night.

MR. JOSEPH BRAMAH has acquired the business of Messrs. C. Harlow and Co., of Cadena Works, Hillsborough, which will in future be carried on by him at the City Radiator Works, Chapel Walk, Sheffield. Mr. Bramah has had many years' practical experience in the production of radiators, tanks, wings and other parts of motor-cars, and has good facilities for the prompt execution of orders for such work.

FROM the Reo Motor Company we have received an interesting pamphlet entitled "A Reo around the World," a perusal of which does much to show how rapidly the Reo cars have sprung into prominence in practically every country of the world. A feature of the booklet is the large number of snapshots of these vehicles taken in Java, Chili, Guatemala, Mexico, Sumatra, Peru, New Zealand, Russia, &c.; in fact, it may be said that there is now hardly a civilised country in which the Reo has not made itself evident.

THE Horley Motor and Engineering Company, Ltd., of Horley, Surrey, are introducing a new type of honeycomb radiator which comprises some useful features, and a fuller reference to which we hope to make in a later issue.

THE three British automobile papers from which the Science Abstracts of the Institution of Electrical Engineers were taken in 1908 were, according to an official list just issued, the *M.C.J.*, the *R.A.C. Journal* and our contemporary in St. Martin's Lane W.C.

MESSRS. MACBETHS, the well-known clothiers, of Bold Street, Liverpool, are just now showing a splendid range of motor clothing. They are also agents for Messrs. Burberry, of London, whilst they make a special feature of their patent reversible rain-proof coat.

MESSRS. T. W. THOMPSON AND CO., of Greenwich, whose charging and electric lighting plants, dynamos, &c., are well known, are now making a range of small horizontal gas and petrol engines adapted for a variety of purposes. At the time of our visit, last week, we noted a charging outfit being packed for shipment to a motor company at Auckland, New Zealand.

THE "Panne" or breakdown competition organised by the Birmingham Motor-Cycle Club, referred to in our last issue, was won by Mr. E. C. Evans. In one machine fitted with accumulator ignition the plug switch was not making proper contact, while the other, which was provided with a two-cylinder engine with magneto ignition, had a short circuit in the switch wire and the high tension leads of the cylinders reversed. Mr. Evans succeeded in tracing the three faults and putting the machines in order in the short space of eleven and a half minutes.

ONE of the chief attractions of the forthcoming motor-car exhibition in Manchester will be the "F. L." car exhibited by Messrs. R. M. Wright and Co., Newland, Lincoln. Although of French manufacture, and so far unknown on the English market, we may say that the manufacturers of the new car enjoy the highest possible reputation in France in the construction of automobiles, and the well-known Lincoln firm are to be congratulated upon securing the sole rights for the United Kingdom. The vehicle is fitted with a 12-16-h.p. four-cylinder engine, 80 mm. bore by 100 mm. stroke. The lubrication is pressure fed by means of a gear-driven pump; the thermo-syphon system of water cooling is adopted. The transmission is through a three-speed gear-box and cardan shaft, the latter being encased in a tube rotating on ball bearings. The steering gear is of a special design, a four-point segment being used. The ease of dismantling is an important feature, and in the "F.L." car, by the introduction of several new devices, the work is reduced to a minimum, thus resulting in great economy in connection with the repairs generally.

MESSRS. ARCHIBALD CONSTABLE AND CO., Orange Street, Leicester Square, W.C., have just issued Vol. IV. of the "Technical Dictionary in Six Languages." It deals with the subject of internal combustion engines, and has been compiled by Karl Schikore; the volume forms one of the excellent "Deinhardt-Schlomann series" of technical dictionaries, of which we cannot speak too highly. In fact, the series stands alone, not only in respect of its polyglot character, dealing as it does with German, English, French, Russian, Italian, and Spanish, but also with regard to the arrangement of its contents. Wherever possible the definitions are accompanied by a self-explanatory thumb-nail sketch. The words are grouped in order of subject, and a full alphabetical index is provided, by means of which the position of any term can be found at once. In the volume under review, which should prove indispensable to all concerned with the development of internal combustion motors, whether of the gas or petrol type, gases and oils, the theory of internal combustion engines, materials and their manipulation, the construction, equipment, and erection of engines, complete plants, working and testing, and economics are dealt with in separate sections. We note that Herr K. Deinhardt has retired from the joint editorship of the series; the remaining volumes, of which some seven or eight are projected, including one on automobiles, will be edited by Herr Alfred Schlomann, of Munich, alone. No expense has been spared in the compilation of the dictionary, in order not only to make it complete, but also accurate, rendering it an invaluable reference book.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE FUTURE OF THE AIRSHIP.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—An article recently appeared in the "Engineering News" (New York) on this subject. One does not like to challenge so great an authority, but really when they state that the flying machine is the most vulnerable of military apparatus, and offers an ideal mark to the bullets of the enemy, they show a lack of knowledge of both flying machines and warfare.

There is no knowing what the future may bring, but no one well acquainted with the subject would at present suggest armour-plating an airship or aeroplane, for they would know that it was unnecessary. The captive balloon at Ladysmith was one of the safest spots during the siege, for the simple reason that it was almost impossible to gauge its height and distance, and, in addition, it was continually changing its position. There is no doubt that an aeroplane will prove of the greatest service in a campaign for carrying despatches, reconnoitring and many other duties.

At the same time people are well advised to be very wary and cautious of the aerial companies which are almost certain to be launched in the near future; but it is only fair to make it clear that the advice does not so much cast doubts upon the possibilities of aerial navigation as on our

well-known chalky districts, which are drawn through the carburettors. These substances as a rule being hard and dense are more difficult to remove, hence to get rid of them we strongly advise the use of "Decarbonizer" two or three times in succession to properly remove these incrustations. Our chemical decarbonizer will undoubtedly soften all carbon and foreign substances, and if the mixture thereafter applied is right all these substances will gradually work out of the engine when the car is being used in the regular way on the roads.

Now to obtain the best and most lasting results to all cars we advise the regular use of "Decarbonizer" as much for preventing the formation of carbon as for removing it, and the regular use of same every seven, ten, or even fourteen days will keep the engine in such a condition that it will never have to be scraped, a large annual outlay, to keep the car in prime condition, being thus saved; moreover, another great advantage must not be lost sight of, viz., the decarbonizing methods can always be used whenever the engine shows signs of lagging or the same is not acting right, generally caused when one cylinder is not doing its work properly. If a small dose (say three or four ounces) of our "Decarbonizer" is administered anywhere on the roadside and the journey continued, after half or one hour's run the faulty cylinder will be found to work to perfection, and as good as the others—an advantage which cannot be secured by any other known methods.

TOURING IN ALGERIA AND TUNIS.

Pushing a Car out of the Sand.

The Old and New Methods of Travel.

commercial laws, which enable unscrupulous financiers to float bogus companies with impunity.—Yours truly,

H. V. ROE.

THE M.C.J. AND AERONAUTICS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Cannot you introduce into your title something to indicate the attention with which you are recording the development of aeronautics? Several weeks I have suspected that you had left your contemporaries behind in the matter of news, just as you have long gone ahead of the other motor papers with regard to matters relating to aerial navigation. But last week I was curious enough to count the items of news in your columns and those in another journal specifically identified with the movement. The result was to find that you gave 20 per cent. more news than the other; for which information many thanks.—Yours truly,

B. H. T.

CARBON DEPOSITS IN PETROL MOTORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have read your article upon this subject in the last issue of the M.C.J. with interest, perhaps the more so because we are the makers of "Shippey's Chemical Decarbonizer." We should therefore like to say from our experience we find that all cars which accumulate carbon deposits and resinous matters also accumulate other substances, such as calcium, fine sand; also chalk dust in cars working in certain

To properly "Decarbonize" an engine none of the working conditions of the car should be changed except that the oil supply should be simply shut off for a few minutes to make the carbon comparatively dry, so that the chemical compound can soak into same and thus better do its work; this temporary stoppage of the oil supply should, however, never extend over more than five to eight minutes at the outside, and we would say it is best to carry out decarbonizing operations when the engine is well warmed up, because then the "Decarbonizer" more readily mixes with the carbon products, and also allows it to penetrate into the crevices, which on a cold engine it would not do. Water should never be removed when using the compound, as by doing this it creates a condition which tends and is also instrumental in making more carbon.

Many engineers labour under the delusion that it is oil that causes carbon; it is possible that some of the cheaper oils may to some extent aid in the formation of carbon, but we have always maintained that the main cause is by using an imperfect mixture of gas, and we think this can be best illustrated by referring to a Welsbach gas mantle. You will note that when the air supply is insufficient to the amount of gas, flowing carbon is at once formed upon the mantle, and by reducing the gas supply or increasing the air supply the deposited carbon can be burned off, and this same case confronts one and is analogous to the working of a motor-car. We maintain this fact because we know of several vehicles on which our decarbonizer was used, and no doubt with good effect, but where the mixture after using the decarbonizer was so rich that a fresh deposit of carbon was formed nearly as fast as the preparation removed it. The best time to decarbonize and make a good cleaning of the engine is after the car has been run, say, fifteen or twenty minutes on the roads, which plan gets the motor in prime condition for carrying out the objects in view.

We are aware that many engineers use paraffin, and in some cases

get certain results, but, as many of the cheaper oils contain no elements that will affect or attack carbon except sulphuric acid, this, if regularly used, will necessitate that the engine be scraped every six months because of the pitting that follows. Hence we claim many advantages for the use of our improved "Chemical Decarbonizing Compounds," and if they are regularly used according to our printed directions we are able to guarantee the following results, viz., more engine power, increased speed of same, no lagging of same engine, better hill-climbing results, longer life of engine, clean piston rings, clean valves, less wear and tear of tyres, and above all the engine being in good working order. "A longer mileage run is obtained from each gallon of petrol used," thus greatly reducing the working cost of motor-cars.

This new chemical decarbonizer was only publicly introduced by us at nearly the end of last season, but it has met with universal success, and having been instrumental in supplying sufficient to treat over 500 cars of various types, and from information obtained from users, we are able to give most valuable hints as to the best method of cleaning engines of all leading systems, which information we may say is at all times available to your numerous readers. Knowing the importance of this subject this must be our excuse for intruding on so much of your valuable space to clearly explain our general views on the subject.—Yours truly,

SHIPPEY BROTHERS.

A POINT REGARDING COMPRESSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question is often asked, "Are new pistons necessary after worn cylinders have been trued up by grinding?" No doubt the query is due to the fact that it is becoming known how little metal need be

The 48-h.p. Daimler recently supplied to Sir Berkeley Sheffield, Bart. The car is fitted with a landaulet body of the "Coventry" type, painted dark blue, with black mouldings and yellow lines. The upholstery is in blue leather throughout. A feature of this car is the detachable wheels, which consist of artillery wheels fitted to Rudge-Whitworth detachable hubs.

removed by the process mentioned. Still, granted that it is possible to take only just sufficient out of the bore to equalise it throughout, we think you will agree with us that both new rings and a new piston are a *sine qua non* if a sound job is to be ensured.

Would you kindly point out to your readers that quite small pistons should have a clearance of .004 in., and larger ones in a proportion as their diameter increases? Now, as there is always more clearance than this when cylinders are sent to be ground, it is obvious that after this operation there must be more clearance than is advisable. It is distinctly bad practice to rely solely on a new set of rings; the pistons as well should be a proper working fit. To bolster up a sloppy piston with a set of extra stiff rings is but a makeshift, and causes loss of power by the unnecessary friction.—Yours truly,

A. E. G. CRAIG.

General Manager, Acer, Ltd.

THE WAR OFFICE TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the War Department Competition for Light Tractors, I am to inform you that the list of entries may be published one week before the date of commencement of the Competition, viz., on Friday, February 19th, 1909.

Passes for admission to the Competition Depot can be had on application to the Secretary, Mechanical Transport Committee, War Office, Whitehall, S.W. Such passes will be required for Press representatives, competitors, drivers, and their assistants. The Press will be allowed to use such information as may be posted daily by the Mechanical

Transport Committee on a notice board, outside the committee room near the competition enclosure. This will include a detail of each day's results, as well as the programme, weights of the tractors, instructions to observers, routes, &c.

The only matter that will be withheld from publication will be the reasons and opinions of the Mechanical Transport Committee, from which the result will be arrived at.

I should be much obliged if you would make this communication public.—Yours truly,

W. BAGNALL-WILD.

Captain, Royal Engineers, Secretary Mechanical Transport Committee.

SOME SUGGESTIONS RE GARAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a motorist of long standing I have often thought I would like to air my views on the subject of garage and garage owners. The equipment of a motor garage is a matter which would appear to require but a comparatively small outlay, either of cash or brains, outside such details as relate to the equipment of the repair shop and the provision for the safe keeping and handling of petrol. At the same time the sharp rivalry which now exists everywhere, even in many small towns, between the proprietors of neighbouring establishments makes it imperative that efforts should be made to cater for motorists in every possible way.

Apart from arrangements for washing, replenishing the petrol and water tanks, no small return may be gained on a relatively insignificant outlay in sundry labour-saving appliances for the use of employees. Thus, the provision of a fairly lengthy system of air piping connected with a compressed air tank or air compressor, so that flat tyres may be inflated without the necessity of moving the car at all, or not more than a few feet at most, may save the tyre of a customer's car from standing on the rim for a period of days, or even weeks. Similarly, convenient charging appliances for ignition batteries may mean the frequent replenishment of cells which otherwise might go too long without attention. The provision of an ample number of sockets for connecting portable inspection lamps is another little matter which involves an inconsiderable outlay in proportion to the convenience it brings.

Still another convenience which might be installed at slight cost, and which would be particularly appreciated in garages where any number of closed cars are handled, is a vacuum outfit for cleaning the interiors of the vehicles. Such an outfit, piped to a point on or near the wash, for example, might be made the means of drawing not a little desirable business to a garage which otherwise might be diverted elsewhere.—Yours truly,

W. FLOCKTON.

SOME PRACTICAL HINTS ON THE COST OF MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motoring, on the supposition that it is expensive, has, to a certain extent, been classed as a sport for kings alone, many believing that only those who are particularly well blessed with this world's goods should own a car. It is an admitted fact that large sums of money are yearly spent by those who own high-powered cars, and to a large extent it is the report of the first cost and after upkeep of such vehicles that frightens many would-be motorists from owning a car either for pleasure or in combination with business.

The automobile has now become such a universal medium both for recreation and business that any wrong impressions which have gained ground should as far as possible be dispelled. The late Lord Beaconsfield said that "the luxuries of one generation became the necessities of another," a statement which may well be applied to the new form of locomotion.

When buying a car a purchaser should first ask himself how much money he has at his disposal to spend upon its upkeep. Owing to the very wide difference both in power and price it is by no means a restricted area. It is folly to buy a high-powered fast-running car, either new or second-hand, because it can be obtained a bargain, if when secured there is not the wherewithal to keep it going. The difference in the expenses between a machine of great horse-power and one of considerably lesser power is much greater than the general public are aware, and yet the possibilities of the latter are numerous.

The fascination of fast travelling and the exhilarating effect therefrom can alone be appreciated by those who have experienced such sensations. Starting on a journey northwards the ever-changing country grows upon one, first threading the needle of traffic out of London, then the Great North Road, over which the fast car is moving in frantic haste, which has for spectators old and stately trees that looked down from above upon our ancestors in what is often spoken of as "The good old times," but what we now regard as the slow-going stage coach period. Our trusty car, like an Eolian harp that attunes itself to every passing breeze, ascended each incline without an effort. After a halt to refresh the inner man at Doncaster, we sped on across the Yorkshire moors to the Border town, where we tarried for the night, to resume our journey to the breezy Highlands north of Inverness. One cannot deny but that the cost of such travelling is expensive. The object of giving the foregoing trip and the following paragraph is to show that much may be achieved on a less expenditure.

The writer was one of a party in an 80-h.p. car by one of the best makers; everything was in perfect order, and the car nearly new, when the bonnet was turned northwards in Piccadilly, but by the time we drew up at our journey's end the tyres were in such a state that repairs at a cost of fully half the original outlay would be necessary before they could again be toured with. Granted, advantage of the high power was taken and fast travelling indulged in; no undue braking, however, took place, and the owner, an expert driver, drove the whole way; the consumption of petrol was also considerable. Such an expenditure is abnormal, and very fast travelling has far too terrifying an effect on the majority of people to get any degree of comfort during the journey. Again, little can be seen to advantage of many of the beauty spots *en route*.

It is no uncommon experience for one who is absolutely fearless behind a horse to be most timid in a motor-car; this to a very large extent may be accounted for by the knowledge of and the faith one has in a horse's intelligence; it is a well-known fact that a horse will by natural instinct avoid danger, and has many times at a critical moment prevented an accident which, owing to the driver relaxing his attention for a moment, would have taken place. There is no such margin of safety with the self-moving vehicle. At the same time it cannot be denied that a driver at the wheel who is calm and collected, with sound judgment, would have more control over a motor than the driver over the horse.

The high-powered car became the rage chiefly because the makers found that a prospective buyer who was willing to give £800 to £1,000 for a vehicle could be much more easily induced to go to £1,200 to £1,500 than one who was prepared to spend £500 would increase his purchase to £700. The demand for 40-50-h.p. cars is, however, fast becoming a thing of the past, except for racing machines, which are a law unto themselves, and those of 20-30-h.p. for touring and the 10-12-h.p. for short journeys are taking their place. Having these facts in view, it will be interesting to consider the running costs and possibilities of such cars.

Taking a useful touring car seating five persons and of 25-30-h.p., the initial net first outlay need not exceed £375. In calculating the running costs distance travelled is an all-important factor; accepting 7,000 miles as a fair average annual mileage, petrol may be taken at about £35, and tyres, repairs and renewals £80, so that, with insurance and a chauffeur at 30s. per week, the total yearly upkeep should not exceed £225 per year. Such a sum and mileage would work out at approximately 7½d. per mile run. Depreciation has not been included, as it is a much-debated question and depends upon local conditions and circumstances. Some consider that a sum should annually be set on one side that would buy a new car every six years, but with fair usage an automobile should last much longer than that. If co-operation is adopted and two join in a car it will be seen that it is a reasonable and healthy way of travelling, and there are few such pastimes that can be obtained at so reasonable a cost.

Passing on to a smaller car, with which much touring may be done, and now so extensively used by doctors and others, the upkeep is considerably less. The writer has in his mind's eye a two-cylinder car of 10-12-h.p. of a well-known make; it ran in the year 7,500 miles, during which time it cost:—

| | £ | s. | d. |
|----------------------------|-----|----|----|
| Petrol | 25 | 0 | 0 |
| Tyres | 25 | 10 | 0 |
| Garage | 15 | 0 | 0 |
| Repairs and Licence | 15 | 0 | 0 |
| Insurance | 7 | 0 | 0 |
| Sundries | 5 | 0 | 0 |
| | £92 | 10 | 0 |

or, with a chauffeur recruited from the handy-man class, after a little training, at 25s. per week, the total cost would not exceed £158 per annum.

The expenditure on a horse and carriage, putting fodder at 14s. per week, would not be less than £125 for a much less mileage—in fact, it would require two horses to cover so much ground; it is generally admitted that 100 miles in the seven days is the limit of a horse's endurance. Such being the case, the equine total must be increased to an annual expenditure of £168.

In conclusion, it may be said, and without fear of contradiction, that a car that cost £800, three or four years ago, can now be bought for £400, with all the improvements and experiences gained during such times thrown in, which has not only enabled a better article to be made with less fear of breakdowns, but one that is much more economical in petrol consumption, thus reducing the yearly outlay.

The relationship of a motor-car to the horse may be compared to that in which the railway of fifty years ago stood to the stage coach, and the rising generation will look upon anti-motorists of the existing period in the same light that the adult of to-day looks back upon the anti-railway fanatic of half-a-century back.—Yours truly,

E. T. H.

MERCEDES DAIMLER PATENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the correspondence on this subject, we notice the letter in a recent issue of your paper from Messrs. Charles Jarrott and Letts, Ltd., referring to the patents jointly owned by this company and the Daimler Motoren Gesellschaft. In their letter they refer to us as a company "calling itself the Mercedes Daimler Motor Company, Ltd.," and anyone reading their letter would imagine that this firm had never heard of this company before, nor of our Mercedes Daimler patents. It will no doubt surprise your readers to know that this company is not unknown to them, they having been in negotiation with us with a view to obtaining a licence under these very patents, with a minimum royalty of £1,000 per annum, and actually paid to us the sum of £150 for an extension of time and option, and they surely would not have paid this sum unless they had satisfied themselves as to the seriousness of their position. The insincerity of their attitude is obvious, for in one of their own circulars, which we have before us, in no less than four places they improperly use the word "Mercedes," and say "that their car is modelled after the Mercedes." In regard to the radius rods, they say "they are in the fashion of the Mercedes." In regard to the gear-box, they say "it is admittedly modelled after the Mercedes, and follows closely on the well-known Mercedes lines." In regard to the steering mechanism, they say "it is the Mercedes type." In regard to the radiator, they say "this is similar to the Mercedes."

In this matter the word "Mercedes" has gained, as you know, a very great reputation, at an altogether unparalleled cost in endless experiments and discoveries; it is, moreover, a registered trade mark, so you will see it cannot be fair to attempt to build up a trade on other people's reputation without paying for it. We would, therefore, suggest that, before anybody acts in the way proposed by your correspondents, it would be desirable for them to take some independent authorities' advice as to the validity of our patents, as it is an absolutely dishonest act for anyone to trade and use these patents, which we have purchased

Bonne Voiture, Bon Voyage, Bon Accueil.

Reproduced from one of the handsome full-page illustrations in the catalogue just issued by the Peugeot Company.

and on which large sums of money have been spent, without paying us a fair and reasonable royalty in accordance with the laws of this country; and we must take great exception to the effort to create prejudice to the lawful acts of the Daimler Motoren Gesellschaft and ourselves, in upholding the rights of our properties.—Yours truly,

J. HIGGETT.

(For the Mercedes Daimler Motor Company, Ltd.)

A CORRESPONDENT writes a warning against a man carrying bill-heads with a north of London address, who is calling on motorists suggesting the repair of accumulators, which he takes away with him.

THE Assistant Secretary of the Aeronautical Society of Great Britain, of 53, Victoria Street, Westminster, S.W., asks us to mention that they are anxious to receive from manufacturers of aeronautical motors, now or about to be put on the market, particulars of the same for the information of members.

A REFINEMENT of the "W. and G." taxi-cabs, so successfully put on the streets by Messrs. W. and G. Du Cros, Ltd., of the Panhard-Levassor works, Acton Vale, W., is a direction indicator, worked by an endless chain. This device enables the occupant of the motor-cab to instruct the driver to turn left or right, slow down, stop, quicken up, in fact to do anything the passenger wishes. The new indicators are so neatly and solidly constructed that they will probably be speedily in demand for use in privately owned cars.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE General Committee of the R.A.C. held their February meeting last week, when thirteen clubs were represented. They approved of the appointment of a travelling inspector to assist the associated clubs in suppressing inconsiderate driving and also to help in connection with the appointment of hotels and repairers.

Five representatives were appointed to attend the Conference to be held at the Inns of Court Hotel, London, on the 19th inst. to discuss "the best means to be adopted to bring about a better understanding between cyclists and motorists."

The Organising Committee has appointed a sub-committee, consisting of Capt. H. H. Deasy, Mr. Robert Todd, and Mr. Victor Hart, to consider the arrangement of special facilities with regard to motor-car insurance. It is hoped that they will make a report at the March meeting.

AUTOMOBILE ASSOCIATION.

ON Friday, the 5th inst., the Northern section of the Automobile Association held its annual dinner at the Midland Hotel, Manchester, when a large company faced Colonel W. J. Bosworth, who presided.

This was the second annual event at Manchester, and the Colonel mentioned that the membership of the Automobile Association had during the year increased from 4,000 to 8,500, considerably more than doubling itself. The membership of the Northern branch, which included the City of Manchester, had grown even in more rapid proportion—namely, from 400 to 1,767. He was satisfied that the association would continue to gain strength in the North of England, especially while the local committee contained such men as Councillor Kay, Messrs. H. Hollingdrake, Newton, Dobson, Wade, and Thomson. The presence of the Mayor of Salford, the Mayor of Wigan, and the chief constables

A Reminiscence of the A.C.A. Grand Prize Race in Savannah.—A Group of Drivers at the Dinner given in honour of Louis Wagner, Winner of the Race.

Seated.—From left to right—Nazarro (Fiat), third at Savannah; Wagner (Fiat), winner; Hemery (Benz), second.

Standing.—From left to right—Piacenza (Itala); Cagno (Itala); Robertson (Locomobile), Vanderbilt Cup winner, 1908; De Palma (Fiat), fastest lap at Savannah; Duray (Lorraine-Dietrich); Seymour (Simplex); Szias (Renault); Hanriot (Benz); Rigal (Bayard-Clement); Hautvast (Bayard-Clement).

of both Manchester and Salford was alluded to, Colonel Bosworth taking occasion to remark that the relations of the association with the police were now of the most cordial character. The badge was now a prominent feature on cars on the roads throughout the country, and it was evident that the Automobile Association was continuing to fulfil a most useful purpose.

Councillor Kay responded to the toast of the Automobile Association (Northern section) and said that the organisation had proved invaluable to motorists throughout the North of England. It had a good effect upon the police as well as upon motorists, and it was an excellent sign that scouts were now taking the place of constables in many districts. The Chief Constable of Cheshire, for instance, had admitted that the Automobile Association scouts were extremely useful in warning motorists of the dangers of the road; in fact, he had come to the conclusion that they were even better than policemen, who simply stood like dummies while the scouts did wave their arms about and did something.

Mr. H. Hollingdrake having proposed the toast of "The Press," a musical programme was rendered. This was broken into at one point in order that the Chief Constables of Manchester (Mr. R. Peacock) and Salford (Mr. Godfrey) should be installed as honorary members of the Automobile Association. Their healths having been drunk, both responded, the speech of each according well with the tone of the meeting. One drew from Colonel Bosworth the assurance that he intended to take

out his licence in Manchester, and Mr. Peacock, in the course of his reply, said that in his district they were only concerned with summonses for driving to the danger of the public, never for merely exceeding the legal limit, a regulation which he would abolish. It was against his policy to attempt to entrap motorists on small technicalities. This policy was endorsed by Mr. Godfrey, the Chief Constable of Salford, who added that whilst he intended to pursue an active course against those who drove to the public danger, he had at the same time the dangerous areas in his own district marked out, so that the safety of those who drive had been well considered.

LINCOLNSHIRE.

THE annual general meeting of the Lincolnshire A.C. was held at the Guildhall, Lincoln, on Friday, the 5th inst., when the president, Sir Hickman B. Bacon, Bart., presided. The annual report made reference to affiliation with the M.U. and expressed regret at the tendency of local district councils to hurl general charges of reckless driving against motorists. Mention was also made of the scheme for the registration of owners of motor-cars willing to render assistance at the mobilisation of the Territorial force in case of invasion. During the year forty-two new members had been elected, the number now being 244. The balance in hand was £113.

Major J. A. Cole proposed the adoption of the report and accounts, which was seconded by Dr. W. J. Gilpin and carried unanimously. Sir Hickman Bacon was re-elected president and Sir Berkeley Sheffield, M.P., and Mr. Arthur Shuttleworth were elected vice-presidents of the club. The election of the committee resulted as follows:—Lindsey Division, Mr. T. G. Tickler and Major Fowler; Holland Division, Dr. Mason and Capt. Gleed; Kesteven Division, Mr. G. Godson and Mr. W. A. Tomlinson; independent, Dr. Cragg, Dr. Gilpin, Dr. Godfrey Lowe, Capt. H. E. Newsum, Mr. W. R. Pennell, and Mr. W. Ives. Mr. A. A. Padley was re-elected hon. solicitor, Mr. Simpson hon. treasurer, and Mr. C. W. Page auditor. Regret was expressed at the resignation of the hon. secretary, Dr. Godfrey Lowe, from the position he had filled during the last few years, and a suggestion was made that the committee should find some way to show their appreciation of the work he had done for the movement. Dr. Lowe mentioned that during his time of office the membership had practically doubled. When elected hon. secretary he had hoped to become an automobilist, but had not yet arrived at the dignity of owning a car and he felt that his position was rather anomalous. His work in connection with the Territorial force was making great demands upon him, and although he would continue to act until a successor was appointed, he regretted that his decision was really final. A vote of thanks to the Mayor for the use of the Town Hall was moved by Major Cole and carried with enthusiasm, as was also a similar vote to the president.

NORTH-EASTERN.

AT the annual meeting of the North-Eastern Automobile Association a slight decrease in the number of members was reported, the present totals being:—Individual members, 343; affiliated through the district clubs, 237; total, 580. Mention was made of the special attention which had been given to the action of the police at Morpeth and Alnwick, and also to the arrangements of the surveyor to the Northumberland County Council to place special warning notices marked "Drive Slow" at many places in his area. The attention of the members was drawn to the regrettable increase of feeling hostile to automobilism in the northern counties, which has led to greater vitality in the agitation for the institution of speed limits; hence the expression of the hope by the committee that motorists generally in the North of England will by careful driving do something to mitigate the irritation that has been caused.

NORTHAMPTONSHIRE.

A MEETING of the committee of the Northamptonshire A.C. was held at the George Hotel, Northampton, last week, when the Rev. Steggins Pratt was in the chair. The hon. secretary, Mr. S. H. Harris, read a letter from Colonel C. E. Foster, which was discussed, and it was proposed by Mr. A. Webb, and seconded by Mr. Humphrey Bennett, "That anyone directly connected with the motor trade should not be eligible for any official position in the club beyond that of an ordinary member." This was carried unanimously. It was decided to recommend an alteration of rule to this effect. Mr. C. W. Bartholomew presented the club with a survey atlas of England and Wales, and it was decided that it should be kept at the George Hotel, where the members of the club could refer to it on application to the proprietor. The chairman and committee, on behalf of the club, thanked Mr. Bartholomew for his very useful present. Rules were submitted by the sub-committee for speed trials and other club events. They were adopted in the following form:—1.—That a small entrance fee be charged for all events. 2.—That every car participating in any club event shall be owned by a member, and must be driven by the owner, except by special permission of the committee. In all gymkhana events the car must be driven by the owner. 3.—No car exhibiting a trade number will be permitted to compete in any club event. 4.—Cars entering for any speed trials must be ordinary touring cars, and must not exceed 60-h.p. based on the R.A.C. rating. 5.—That no competitor be allowed to make trial runs over the course on the day of the event. 6.—The decision of the judges to be final.

In accordance with rule, the following members retired from the committee: Mr. J. C. Hipwell, Dr. A. A. Hope, Dr. Lewis, Mr. T. Horton, and Mr. C. Phipps. They were re-elected, with Colonel C. H. Eyre Coote. Sir Thomas Hesketh was nominated as president for the ensuing year, and the following were nominated vice-presidents: Lord Lilford, Lord Annaly, Major P. E. T. Hibbert, Major Leslie Renton, and Mr. Harry Manfield.

The attention of the committee having been drawn to the stopping place of the electric trams in Mercer's Row, they viewed the spot, and, after watching the cars arrive and stop, came to the conclusion that the system of stopping the cars in practically the narrowest part of Mercer's Row is fraught with much danger, and that there is every likelihood of a serious accident occurring sooner or later. The hon. sec. was directed to communicate with the Town Clerk, expressing the view of the committee, and suggesting that, for the safety of the public, arrangements should be made in the future for the cars to stop in the wider part of the street, viz., opposite the stopping place sanctioned by the Board of Trade.

LANCASHIRE.

MR. A. CAYLEY, J.P., has been elected president of the Lancashire A.C. and Mr. A. Birtwistle has been re-elected hon. secretary. The new committee consists of the following gentlemen: Messrs. E. S. Berry (Leyland), A. Birtwistle (Blackburn), W. Birtwistle (Blackburn), J. Briggs-Bury (Poulton), W. Dryden (Preston), Dr. J. Fox (Accrington), A. L. Marsh (Blackburn), H. Lonsdale (Accrington), J. D. Lonsdale (Blackpool), C. E. Kenyon (Clayton-le-Dale), J. Hodson (Preston), Dr. Stephenson (Blackburn), R. Mangnall (Darwen), G. D. Walmsley (Blackburn), G. H. Redmond (Leyland), E. A. Riley (Haslingden), C. E. Sharrock (Lea Gate), H. H. Stottard (Manchester), W. Smith, jun. (Accrington), and J. Iddon (Leyland).

BEDFORDSHIRE.

As we briefly recorded last week, the annual dinner of the Bedfordshire A.C.C. was held at the Town Hall, Luton, on the 1st inst. Mr. W. H. Allen was in the chair, and among those present were the Mayor (Mr. H. Arnold), Dr. Ashhurst, Messrs. G. L. Hart, W. A. Sale, G. A. Phipps, G. J. Whyley, E. W. Hart, H. G. Burford, J. Coveney, G. Lewin and C. E. Whittaker.

The Chairman gave the toast of "The King," and then proposed "The Mayor and Corporation of Luton." Referring to the advantages which the town in particular and the county in general offer to manufacturers the Mayor referred to the new industries which had lately come into the town, including the Vauxhall Motor Company and the Commercial Cars, Ltd.

Mr. W. W. Marks proposed "The Club," and referred to the fact that in Bedfordshire there were 678 motor-cycles and 297 motor-cars registered. The total was 975, and the number of drivers' licences issued was 849. He suspected that a number of gentlemen had been driven to take out licences in the county where they were decently treated, hence the reason for the number of motor-cars registered in the county being in excess of drivers' licences.

Response was made by Mr. Allen, who mentioned that he was one of the first to introduce motor-cars into the district. He declared that the success of the club was entirely due to the secretary. To the toast of "The officials," proposed by the Rev. W. P. Beckett, Mr. G. J. Whyley responded, and referred to the history of the organisation, which dated as far back as 1905, the real success, however, coming in 1907.

Before the dinner the annual general meeting was held in the Mayor's Parlour at the Town Hall, when the accounts showed a balance at the bank of £51, the members' subscriptions amounting to £119. Lord Ampthill was re-elected president. The re-election of vice-presidents, viz: Messrs. Percy Barlow, M.P., W. A. Attenborough, Guy Pym, and Sir Julius Wernher, was proposed by Dr. Bower, and seconded by Mr. Rupert Allen. Mr. Herbert Cotchin's name was added to the committee, who were re-elected as follows: Messrs. W. H. Allen (chairman), E. Colby Sharpin (vice-chairman), A. H. Adams, Rupert S. Allen, A. B. Brackenbury, E. W. Hart, R. J. Hope, W. B. Jessopp, W. K. Parbury, Oliver Smithson, C. Ernest Wells, the Rev. C. B. Hulton, and Dr. D. Bower.

HEREFORDSHIRE.

MR. A. W. FOSTER presided at the annual meeting of the Herefordshire A.C., held at the Mitre Hotel, Hereford, on the 3rd inst. The secretary, Mr. W. Townsend, said they had a fairly good balance in hand and the accounts were agreed to. With regard to the trophy presented by the citizens of Hereford for the hill-climbing trial which had been abandoned, it was resolved that the Town Council should be asked to keep the cup with the Corporation Plate until such time as the club should wish to use it for a competition.

CARDIFF.

THE Cardiff Motor Club held its annual dinner at the Queen's Hotel, Cardiff, last week, when the president, Lord Ninian Stuart, presided, supported by the Lord Mayor and many local influential gentlemen. The President submitted the toast of "The City and Trade of Cardiff," to which the Lord Mayor responded. The toast of "Motoring" was proposed by Mr. Herbert Lewis, Mr. F. C. Schackel responding. He said the Cardiff and Glamorgan County police were very tactful and fair in their dealings with motorists, the prejudice against whom was fast dying out. Councillor

J. W. Curtis, J.P., gave "The Motor Union," on behalf of which Mr. Rees Jeffreys responded, congratulating the Cardiff Club on the possession of an excellent secretary in Mr. H. B. Jotham, and declaring that there was no justification for any suggested increase of taxation on motorists. Among other speakers was Mr. J. Thompson Willows, the secretary of the South Wales and Monmouthshire A.C., who responded for the visitors.

NORTH MIDDLESEX.

THE annual general meeting of the club was held at the headquarters, Great Northern Hotel, King's Cross, on the 29th January, Mr. A. Hassal being in the chair. The reports of the hon. treasurer and the hon. secretary for the year 1908 were adopted. The secretary's report, which reviewed the events and work of the year, included mention of the alteration in the club's title (from the North London A.C.) and the consequent extension of its sphere of activities. In January of last year the headquarters had been transferred to the Great Northern Hotel, King's Cross, where members were provided with a pleasant rendezvous. At a special general meeting of the club held in October last it had been resolved to become associated with the R.A.C. and so become the North Middlesex branch of the Royal Automobile Club.

In recognition of his services to the club Mr. A. Hassal was elected to the office of vice-president. The president (Col. Henry F. Bowles, J.P.) and the vice-presidents were unanimously re-elected. The following officers were also elected for the ensuing year. Committee: Messrs. A. Alexandra, C. Cannon, E. H. Clements, Comley, C. Cutler, A. C. Denham, E. Gamage, Gibson, Max Graddon, C. F. Gray, H. Johnson, S. J. Kent, Lendrum, F. W. Lewis, A. Robertson, H. Stonehouse, Dr. Fulton Turner, W. A. Vincent. Hon. treasurer, Mr. A. D. Kindon; hon. solicitor: Mr. Percy Short; hon. auditors, Messrs. B. S. Douthwaite and Harman; hon. press secretaries, Messrs. J. Cogdale and H. Wilkins Norman (the latter being also elected an honorary member of the club); hon. secretary, Mr. J. Thomas Barber, Medina, Hardwicke Road, Palmers Green, N.

A Humber Car in Tasmania.

Not only at home but also abroad is the motor-car now pressed into service for commercial purposes. Messrs. Humber, Ltd., have just received from Mr. W. Thompson, of St. Helena, Tasmania, an interesting picture post-card, which we reproduce above, depicting a 15-h.p. Humber car just about to start on a hundred mile run with four commercials aboard. Mr. Thompson, who is at the wheel, points out that this car has to negotiate the steepest hills in the district, which are considered to be the worst to be found in Tasmania.

LIVERPOOL MOTOR DRIVERS' ASSOCIATION.

AT the Star and Garter Hotel, on Sunday, a large meeting of members of the Liverpool Motor Drivers' Association assembled with a view to finally settling the rules in connection with the formation of this body. Mr. Edward Gormley, the appointed chairman, was present. It was pointed out that members would be entitled to the free use of the club room, which would include billiards, cards, and the usual refreshments, death claims, superannuation, sick benefits and free legal assistance. There were present at the meeting 162 members. The meeting was further adjourned until the 20th inst.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

MR. W. H. HARVEY was in the chair at the last monthly meeting of the Executive Committee, when a bank balance of £693 was reported. Mr. C. D. Pole, of Messrs. Singer and Co., was elected to a governorship by virtue of having introduced twenty-five new subscribers, he being the first to thus qualify.

The next monthly meeting of the Executive Committee will take place on the 2nd prox.

IRISH.

FOR some time past the committee of the Irish A.C. have had under consideration the question of appointing a club engineer. They have now appointed Mr. H. Croxon, resident engineer in Dublin to the Car and General Insurance Corporation. His services will only be available to members of the club, and those who from time to time may desire advice.

upon the condition of cars can have them examined by him at a reasonable scale of charges, particulars of which can be obtained from the club secretary, at 34, Dawson Street, Dublin.

SCOTTISH.

ON Monday afternoon, 8th inst., the Right Hon. John Sinclair, M.P., the Secretary for Scotland, with whom was Mr. J. M. Dodds, Under Secretary, received a deputation from the Scottish Automobile Club on the subject of the regulations under the Motor Car Acts, 1896 and 1903, relative to motor-cars passing tramway cars on overtaking them. After the whole matter had been fully discussed Mr. Sinclair promised to give the views of the deputation the fullest consideration.

Following upon this the Secretary for Scotland issued that evening an Amending Order (applicable to Scotland.) This is referred to on another page.

BROMLEY AND DISTRICT MOTOR DRIVERS AND MECHANICS' CLUB.

MR. D. T. ALLEN, whose motoring experience extends back to the early Benz and Peugeot, presided at the first meeting of the newly-formed Bromley and District Motor Drivers' and Mechanics' Club at its new headquarters last week. The meeting was very well attended by owners and also driver- and mechanics, and in his address Mr. Allen remarked that it was the first club of its kind in the country. It has already forty members. The committee would keep a register of drivers.

After the election of officers, Mr. H. D. Smith, assistant engineer to the R.A.C., gave a lecture on the care of the car, and remarked that the comfort of the passengers would be increased if drivers drove round corners at a much slower speed than usual, by slowing up by the action of the engine instead of the brake, and by taking wider sweeps off the straight when avoiding other traffic.

The headquarters of the club are in a hall at Mason's Hill, on the South Hill Estate, and the room will be open each night of the week. Mr. Herbert Levens is the hon. treasurer, Mr. H. E. Mills the hon. secretary, and the committee consists of Messrs. E. Laws, Brittain, G. Kemp, F. Springett, J. Steer, B. Alliston, C. Ryder, Goldsworthy, Shannon and G. Hartridge.

MR. A. RICHARDS, Sunny View, High Street, Bolton, is the hon. sec. of the Bolton and District Motor Cycle Club, which has just removed its headquarters to the Pack Horse Hotel, Bolton.

MR. N. M. ROGERSON having tendered his resignation as secretary of the Halifax A.C., Dr. J. Crossley Wright, 4, Park Road, Halifax, has been elected in his place, with Dr. E. N. S. Hughes, Dane Court, Halifax, as treasurer.

THE annual meeting of the Surrey Motor Cycle Club was held last week at the headquarters, Albion Hotel, Woking, when it was reported that the membership was forty-seven. Mr. Stanley Christopherson was elected president, Mr. R. Ranger captain, and Mr. Cox secretary. It was resolved to move the headquarters to the Angel Hotel, Guildford, which was considered a more central location.

PUBLIC SERVICES.

THE London Electrobus Company have extended their Liverpool Street to Victoria route to Earl's Court, through the following thoroughfares:—Ebury Street, Sloane Square, Sloane Street, Brompton Road, Cromwell Road, Earl's Court.

ACCORDING to Sir Henry Oakley, in his address to the shareholders of the Central London Railway Company last week, there are 647 motor-omnibuses passing over practically the whole of their line from Lancaster Gate to the City as well as 150 horse-buses. At the British Museum the competition is even more keen, there being no fewer than 707 motor-omnibuses and 1,103 horse-buses stopping and picking up passengers in the vicinity of the station at that point.

THE Fife Motor Transit Company have put on a service of motor-buses between Crossgates, Lochgelly, Glencraig and Kelty, with Cowdenbeath as headquarters.

ON Monday a deputation of cab-drivers waited upon Mr. Herbert Gladstone, the Home Secretary, and urged the following points:—Motor-cab licences are revoked without sufficient consideration. Hardship is inflicted by the revocation of licences for exceeding speed limit in park, and for other trivial offences. Cabmen are refused licences for offences of the past which have nothing to do with ability in driving motor-cabs. Mr. Gladstone should differentiate in the matter of fines between licensed hackney motors and private hackney motors. The reply of the Home Secretary was in the main sympathetic, but he alluded to the adverse feeling which had been excited in the public mind by the speed limit being so often exceeded, whilst agreeing that the men were entitled to have their individual cases examined and to be protected against unfair decisions if any took place.

FROM the Bleriot depot in Long Acre comes an interesting circular descriptive of their patent No-Glare motor lamps, which were recently illustrated and described in our columns. The new Bleriot lamp gives a good light, whilst the elimination of the dazzling effect of the ordinary lamp is well in accord with the resolution of the Committee of the Royal A.C. which was recently adopted on the subject.

CASES AGAINST MOTORISTS.

A 75 PER CENT. REDUCTION.

At Mortlake, on the 3rd inst., Harry Simmons, of 4, Albert Grove, North Acton, was fined £4 and costs for exceeding the speed limit on the public highway at Barnes Common on January 19th. Abbott Sillett, of Crossdeep, Twickenham, denied a similar charge. The police evidence showed that he drove at the rate of over twenty-seven miles an hour, and for the defence Colonel Sutherland, defendant's employer, and Mr. Crowder, who were in the car at the time, were called, and gave evidence to the effect that, according to the speedometer, the car did exceed nineteen miles an hour. After consulting in private the chairman announced that the Bench were of opinion that the speed had been exceeded, as they had tested the two chronographs and found them accurate. They thought there had been no intention to break the law, and that possibly the speedometer had got out of order. They, therefore, reduced the fine, which would have been £4, to £1 and costs.

DANGEROUS DRIVING.

At Acceck's Green, Birmingham, Charles Bradbury has been fined £10 and costs for driving a motor-car at a speed dangerous to the public.

EXCEEDING THE SPEED LIMIT.

At Spittlegate (Grantham) Phillip Howard Walker, of Ben Rhydding, was summoned for driving a motor-car on the Great North Road at a speed in excess of twenty miles an hour, on December 23rd last, and also for failing to produce his licence when requested. The defendant pleaded guilty. The magistrates imposed a fine of £5 including costs.—The Defendant: May I testify to the civility of the police constable?—Major Longstaffe: We are very glad to hear it.

At Kingston Police Court, Alfred Statuly, Upper Norwood, was summoned for exceeding the speed limit at Esher.—The pace was stated by P.-s. Stringer as thirty-two miles an hour. Defendant said the speedometer registered only twenty miles, but upon being subsequently tested it was found to be wrong. The Chairman said that as he had been straightforward the fine would be only £2 and 9s. 6d. costs.

ON Monday, at the Bromley, Kent (Police Court) a motorist was fined 30s. and costs for exceeding the ten mile limit and three others mulcted similar sums for travelling beyond the ordinary speed limit in the district.

COSTS ONLY.

At Greenwich, on Tuesday, a motorist was summoned for exceeding the legal limit at Shooter's Hill Road. A penalty of 20s. and 2s. costs was imposed, but, after a consulting surgeon of Harley Street had explained that he was being driven to an urgent case at the time, the magistrate ordered payment of costs only.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE MOTOR REPAIRS AND ACCESSORIES SYNDICATE (LTD.), has been registered with a capital of £5,000, in 98 preferred participating ordinary shares of £50 each and 100 deferred shares of £1 each. The offices are at 86, Cannon Street, E.C.

THE Automobile Consultants, Limited, has been registered with a capital of £200.

THE Midland Motor Wheel Company, Ltd., has been registered with a capital of £500 and offices at 87, Gosford Street, Coventry.

THE capital of the Kensington Taxi Company, Ltd., which has recently been registered, is £1,500.

THE Long Acre Autocar Company, Ltd., of 117, Long Acre, London, W.C., has been registered with a capital of £10,000—not £3,000, as has been published.

MESSRS. BENNETTS (Nottingham), have been registered with a capital of £2,000, to take over the business of motor and general engineers carried on by Mr. H. A. Bennett and Mr. R. Watts at Talbot Street, Nottingham, as H. A. Bennett and Co. Private.

"POLICE CONTROLS."

AMONG the police week-end traps reported to us is that in operation every Sunday morning in the ten miles per hour limit in Clarence Street, Kingston, leading to Kingston Bridge. Almost every week motorists are caught travelling at more than ten miles an hour, and, although they are invariably able to prove that no other traffic was about, fines of £2 or £3 are generally inflicted at the Police Court.

ON the Canterbury road there is a measured furlong in daily operation from the Park Lane, at Shooter's Hill, to the Fox. Care should also be taken on the London side of Shooter's Hill.

A MEASURED furlong is in operation at Hanwell, on the Uxbridge Road, and another danger zone is found near Edgware.

THE police "control" which extends over a measured furlong of the Baywater Road, London, is, we are informed, worked night and day.

MESSRS. M'DONALD AND SON, of Edinburgh, have just held a large sale of motor cars at their Great Eastern Motor Mart, Annandale Street, Edinburgh, when satisfactory prices were obtained.

LIGHTS ON VEHICLES ACT, 1907.

AN official *communiqué* which we have received from the Home Office informs us that bye-laws imposing obligations in addition to those imposed by the Lights on Vehicles Act, 1907, have now been made as follows:—

1. Byelaws requiring that an additional lamp attached on the left side, and showing a white light to the front, shall be carried.
 - (a) By all vehicles:
 - County Councils of Glamorganshire, Monmouthshire, and Staffordshire;
 - Town Councils of Dudley, Hanley, Merthyr Tydfil, Newcastle-upon-Tyne, and Stafford.
 - (b) By stage carriages (not being tram cars or tram carriages):
 - Town Council of Hastings.
2. Byelaws requiring that a lamp or lamps showing a red light to the rear shall be carried:—
 - (a) by all vehicles:
 - County Council of West Riding of Yorkshire;
 - City Council of Leeds; Town Councils of Newcastle-upon-Tyne and Reigate.
 - (b) by covered vans:
 - County Councils of Glamorganshire and Monmouthshire;
 - Town Council of Merthyr Tydfil.
 - (c) by any vehicle or load on wheels drawn by another vehicle;
 - County Councils of Gloucestershire, Monmouthshire, Warwickshire, and Worcestershire.
 - (d) by vehicles used for the purpose of carrying loads projecting to the rear:
 - Town Council of Hastings.
 - (e) by heavy and slow going vehicles:
 - Town Council of Salford.
3. Byelaws requiring certain vehicles drawn or propelled by hand (to which the Act does not apply) to carry a lamp showing a white light to the front:
 - Town Council of Hastings.

Orders under section 4 of the Act exempting from the operation of the Act throughout their respective counties vehicles carrying in the course of harvesting operations any farm produce to stack or barn during certain months of the year, have been made by county councils as follows:—

- Berkshire from June to October (inclusive).
 - Buckinghamshire during August and September.
 - Cambridgeshire during July, August and September.
 - Carmarthenshire from June to September (inclusive).
 - Cheshire during August, September and October.
 - Cornwall from June to October (inclusive).
 - Devon from July to October (inclusive).
 - Dorset from June to September (inclusive).
 - Durham from September to November (inclusive).
 - Essex, Gloucestershire and Hertfordshire from June to September (inclusive).
 - Huntingdonshire from July to November (inclusive).
 - Isle of Ely during August and September.
 - Kesteven (Lincoln) from July to November (inclusive).
 - Lancashire from June to October (inclusive).
 - Leicestershire from June 20th to October 31st.
 - Lindsey (Lincoln) from July to November (inclusive).
 - Montgomeryshire from June to October (inclusive).
 - Monmouthshire from June to September (inclusive).
 - Norfolk during July, August, September.
 - Northamptonshire from June to November (inclusive).
 - Northumberland during August, September, October.
 - Nottinghamshire from June to October (inclusive).
 - Oxfordshire from June to September (inclusive).
 - Peterborough, Soke of, from July to October (inclusive).
 - Radnorshire from July to November (inclusive).
 - Somersetshire from June to October (inclusive).
 - Southampton from 15th May to 15th October (not inclusive).
 - Staffordshire.
 - Suffolk East } from June to September (inclusive).
 - Suffolk West }
 - Sussex West, during July, August, September.
 - Westmorland during July, August, September, and first two weeks in October.
 - Wiltshire } from June to September (inclusive).
 - Worcestershire }
 - Yorkshire, East Riding, during August, September, October.
 - Yorkshire, North Riding, from June 15th to October 15th (inclusive).
 - Yorkshire, West Riding, during July, August, September.
- The Herefordshire County Council have made an Order exempting from June to September (inclusive) vehicles actually laden with and carrying to stack or barn in the course of harvesting any farm produce (not being roots or other non-inflammable produce) and proceeding at a walking pace.

Orders of exemption from the operation of the Act have been made under section 3 as follows:—

- Any vehicles being within the boundaries of the Mersey Dock Estate:
 - The Mersey Docks and Harbour Board.

- (a) Vehicles carrying cotton, and (b) all vehicles constructed and used for the carriage of goods while in certain parts of the City or Borough:

The Liverpool City Council and Bootle Town Council.

All vehicles constructed and used for the carriage of goods while in certain parts of the borough.

The Birkenhead Town Council.

ROAD REPORTS.

EAST SUSSEX.—Captain Sergison, a member of the East Sussex County Council, on Tuesday made the announcement that the county main roads this year would cost £4,000 extra to make good the damage done by heavy motor vehicles and steam engines. He considered it inexplicable that the Local Government Board should place obstacles on speed limits being obtained.

HERTFORDSHIRE.—The Local Government Board have made an order regulating the speed of motor-cars to ten miles an hour on a section of the main road from St. Albans to Dunstable at Markyate, Redbourn, and Harpenden Rural.

NEWBURY.—A proposal has been made at Newbury and sanctioned by the Local Government Board to demolish the Town Hall, which stands in the centre of the town, with only narrow roadways around it. Although local architects are denouncing this as an act of vandalism, the fact that 118 motor-cars passed around it in twenty minutes on the occasion of the last Newbury races seems to point to the need for widening the central artery of the town.

WIMBLEDON.—Negotiations are in progress between the R.A.C. on the one hand and the Wimbledon Town Council on the other, with regard to the proposal to limit the speed of motor-cars to ten miles an hour in the principal thoroughfares. The Club had intimated that should the application be limited to Hill Road, Broadway, and that part of Merton Road lying west of Stanley Road, the Club will not oppose an

A Smart Mors 13-15 h.p. Car.

The above illustration depicts a Mors car with Victoria leather hood and glass screen and folding rear emergency seat. This type of vehicle has been recently sold to a number of doctors—amongst others Dr. Heyworth, of Belper, and Dr. Marriott, of Aldeburgh—the one shown in the photograph being for Mr. Chubb.

order being made. On the other side, the Town Clerk has communicated to the Local Government Board practically accepting the suggestions of the Club, so that the expense of an enquiry may be saved to the rate-payers.

SURREY.—Motorists have often regretted the absence of a light at the junction of the Godstone and Brighton roads. They will be gratified to learn that the Beddington Parish Council has now decided to erect a lamp there as soon as a proper site can be arranged.

DARTFORD.—The Dartford Urban Council are about to erect illuminated warning signs at the top of both steep descents into Dartford.

HARTFORD BRIDGE FLATS.—We are informed by the Automobile Association that a gas main is being laid across Hartford Bridge Flats, and that the gas company have fixed a lamp post at the cross roads to Yateley. This is illuminated all night for the benefit of motorists and other users of the roads.

SLOUGH.—The road between Slough and Maidenhead, and also a part of the High Street of Slough itself, are under repair.

HERTFORD.—The Council Council of Hertford have made application to the Local Government Board for the institution of a ten mile an hour speed limit for motor-cars on the main road from St. Albans to London, within the parish of Aldenham.

FROM the Palmer Tyre Company, Ltd., comes a copy of a pamphlet they have just issued entitled "Are your Wheels in Line?" The alignment of the road wheels of a motor-car is a point to which attention should be given, as should it not be perfect the life of the tyres is considerably reduced. The booklet before us illustrates and describes a simple means whereby motorists can easily test the alignment of the wheels of their car. A copy of the pamphlet will be sent on application to the firm.

FORTHCOMING EVENTS.

FEBRUARY.

19th (F.)-27th (S.).—Manchester Motor Show at Belle Vue, Manchester.
 20th (S.).—First Annual Dinner of the Sutton Coldfield A.C.
 22nd (M.).—Manchester A.C. Dinner.
 25th (Th.).—Irish A.C. Annual Meeting.
 26th (F.).—Hull A.C. Annual Meeting.
 Annual Meeting of the Motor Yacht Club.

MARCH.

1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
 18th (Th.).—Royal A.C. Annual Meeting, followed by Annual Dinner at the Covent Garden Theatre.
 20th (S.)-27th (S.).—Cordingley's fourteenth Annual Motor-Car Exhibition and Mart and third Aero Show at the Agricultural Hall, London, N.

APRIL.

10th & 12th.—Easter Meeting at Brooklands.
 24th (S.).—Auto-Cycle Union's Quarterly Trial.
 29th-30th.—Road Conference in London of the County Councils Association.

MAY.

26th-June 1st.—Irish Reliability Trials.
 31st (M.).—Whitsuntide Meet at Brooklands.

JUNE.

10th-18th.—Prince Henry Trophy.
 14th-19th.—Scottish Reliability Trial.

A DAIMLER DINNER.

THE second annual dinner of the London repair depot of the Daimler Motor Company (1904), Ltd., was held a few evenings ago, with Mr. Sharp in the chair. A musical programme contributed to the pleasure of the guests, and among the speakers was Mr. Noble, who, on behalf of the staff, expressed their pleasure at again seeing Mr. Sharp in the chair. The chairman then called upon Mr. T. Brown to propose the toast of "The Workmen," Mr. H. Merrifield responding. Major Fernie proposed the health of "The Guests," and gave some of his experiences with the new Knight engine. He said he had driven his car, which was a 1908 chassis, with the new 1909 engine, over 3,000 miles without the slightest hitch. Mr. Claude Lorraine, Mr. Eadie, and Mr. Price also spoke, and a most pleasant evening was spent, the thanks of all participants being due to Mr. Frank Taylor, who acted as hon. secretary to the Dinner Committee.

WOVEN GLASS ACCUMULATORS.

IN the Chancery Division, before Mr. Justice Joyce, on the 5th inst., an injunction was granted on behalf of Van Raden and Company, Ltd., of Coventry, against Mr. H. W. Van Raden, restraining him from using or permitting his name to be used in connection with the business of the Woven Glass Accumulator Company if and so long as such company carried on business under that name or under any name of which the words "Woven Glass Accumulator" formed part, or in connection with any other business for the sale of woven glass accumulators. The injunction was granted by consent of the defendant's counsel, on the plaintiffs making certain concessions as to costs, and it was agreed that it should be perpetual.

AUTOMOBILE ACCIDENTS.

MR. BASH KING, a Worthing hockey player, was proceeding home on a motor-bicycle through Broadwater on Monday, when a collision occurred between his cycle and a motor-car. He was precipitated headlong through the glass screen of the car on to the rear seat, among the occupants. He lost consciousness, but subsequently was able to be conveyed home in another car.

ON Monday afternoon a hind tyre of his car, which Mr. B. Marley, of Ford Croft, Eversley, Bants, was driving, burst near Broadbridge Heath, on the Guildford road, in the direction of Horsham. The car left the road and went into the ditch, the passengers being thrown out, Mrs. Marley having her collar bone dislocated. Mr. T. Rice, of Messrs. Rice Bros., of Horsham, was able to send another car to the assistance of the unfortunate motorists and to tow the vehicle to his works for repair.

A CORONER'S jury at Hampstead, inquiring into the death of a child who died from the results of injuries received by being knocked down by a motor-car in Heath Street, has expressed the opinion that the Hampstead Borough Council should take steps to secure the imposition of a speed limit of 5 m.p.h. for motor vehicles in that thoroughfare.

BUSINESS NEWS.

FROM the Atlas Motor Car Company, of Springfield, Mass., U.S.A., we have received a copy of the 1909 catalogue of Atlas cars. Two models of respectively 20-h.p. and 30-h.p. are being turned out, the chassis being adapted to receive any standard type of body. The feature of the Atlas cars is found in the engine, which is of the two-cycle type, and which is stated to give excellent results in practice.

THE "W. and G." fire-extinguisher, as used on the motor-cabs run by W. and G. Du Cros, Ltd., from their Panhard-Levassor works at Acton Vale, W., is now being constructed entirely at the works, and is becoming very popular throughout the motor-cab trade.

THE agents for the Star cars in Melbourne, Victoria, are the Acme Motor and Engineering Company, and not the Herne Company, as mentioned in our last issue.

WE learn from the Daimler Motor Company, Ltd., that Mr. F. W. Lanchester has been appointed consulting engineer and technical adviser to the company, and during the course of the next few months he will commence to actively interest himself with the many engineering matters which the company has under consideration. In addition to the manufacture of pleasure motor carriages, the company's field of engineering activity already embraces work in connection with road trains, commercial vehicles, omnibuses, agricultural motors, &c., and as the new Daimler motor opens up possibilities of development in directions in which the internal combustion engine has not fully asserted itself, the scope of the company's business is certain of still further expansion. The new appointment does not involve Mr. Lanchester's severance from the Lanchester Motor Company, Ltd., for whom he will continue to act in an advisory capacity.

THE West Wales Motor Car and Engineering Company, of Melbourne Place, St. Helens Road, Swansea, have been appointed agents for the Ariel cars in Swansea and neighbourhood. The agency for Cardiff and district for the same cars is Hill's Garage, Westgate Street, Cardiff.

IN the quarter ended December 31st, 1908, there were 357 accidents in the City of London, of which six were fatal, two being caused by motor vehicles and four by horse vehicles. Of the street accidents in the "one square mile area" last year 111 were caused by automobiles and 240 by horse conveyances.

THE Sylverlyte Electric Lamp Company, Ltd., of 11, Poland Street, London, W., have sent us a copy of the new catalogue of the "Sylverlyte" electric headlight for motor-cars they are introducing, a reference to which was made in a recent issue. It is claimed for the new lamp that it is the only form which will penetrate thick fog, actual tests having shown that with a 12-c.p. lamp a thick fog was pierced and objects at a distance of twenty yards shown up.

IN addition to their standard 45-h.p. six-cylinder cars, the Sheffield Simplex Motor Works, Ltd., are, we hear, bringing out two new models. The first is a light four-cylinder car which will have a 12-16-h.p. engine (17.9 R.A.C. rating), 85 mm. bore by 130 mm. stroke. Thermo-syphon cooling will be employed, with a radiator and bonnet on Renault lines. The second new car will be a light six-cylinder of 20-24-h.p. (26.8 R.A.C. rating). Both vehicles will be made in two lengths of chassis.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, FEBRUARY 20, 1909.

[No. 520.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

A NEW competition, part of the plan for popularising Brooklands, is about to be inaugurated by Major Lindsay Lloyd on the track at Weybridge. This will be limited to motor-cars of not more than 50-h.p. by R.A.C. rating, and will be a competition for the fastest flying lap under handicap accomplished during the month.

The handicaps for next month and in future months for cars which have not previously competed will be exhibited at the Brooklands course. For future months, vehicles which have previously competed will be handicapped according to their performances in this competition, so long as they compete in the same trim as they did previously. Cars will, before competing, be brought up to a weight representing the average weight of a touring car of similar horse-power with the full number of passengers on board. Time-keepers and other officials will be in attendance on Saturday and Sunday afternoons in each week for the purpose of timing cars which wish to enter for this competition, and on these days no previous notice will be necessary.

The A. A. Accident Census.

FOLLOWING its recent practice of compiling returns concerning accidents attributed to motor vehicles, the Automobile Association now sends us the results for thirteen weeks' observation which ended on Saturday last, these including the sad accident at Staines on that day. The record shows that during the three months fifty persons were killed in Great Britain, the car being responsible for thirty-three fatalities, motor-omnibuses for eight, taxi-cabs for four, motor lorries for three, and traction engines and motor fire engines one each. It must also be remarked that six of the victims were motorists themselves. With regard to these fatalities the figures show that no fewer than thirty-five verdicts of "Accidental death" were recorded, and that in twenty-three of these cases complete exoneration of the driver has also been included in the Press reports of these accidents. Three drivers have been committed for trial for charges of manslaughter, and two have been cautioned by juries. Having regard to the number of motor vehicles which are now upon the road, it cannot be alleged that such figures as these indicate the gross carelessness and recklessness with which many anti-motorists would charge those who drive cars.

English Cars across the Border.

ALTHOUGH little has been heard of the matter, it is interesting to learn that the Scottish Office has been instituting a rather extensive inquiry into the motor-car traffic and the maintenance of roads in the Highlands. This was occasioned by the references which were made last year from time to time as to the damage done not by local residents so much as by motorists who came from south of the Tweed. The Nairn County Road Committee have gone thoroughly into the matter and a day or two ago their replies to the inquiries of the authorities were made known. They referred to a record taken in August last on fifteen consecutive days dealing with the motor-cars passing

through the county by the main through route. The number recorded was 1,222, the individual cars numbering 242. Of these 5.39 per cent. were registered in the county of Nairn, 42.15 per cent. in Scotland elsewhere than in Nairnshire, and 51.26 per cent. in England. Throughout the whole season between June and October there was a large increase, and it was calculated that about 95 per cent. of the motorists were residents elsewhere than in the county, and did not contribute to the upkeep of the roads over which they travelled. Surely such authentic examples as this should assist the movement in favour of a central road authority.

Motor Cycle Races.

IN order to encourage the racing side of motor-cycling the British Motor Cycle Racing Club has been formed, to enter into an arrangement with the Brooklands Racing Club Executive for assistance in the holding of race meetings on the track at Weybridge. Facilities for practice will also be given, and there will be monthly club meetings, at which all classes of riders will have competitions and at which races for the existing types of machines suitable for road work will be held. Mr. A. G. Reynolds is the hon. secretary (*pro tem.*) and application will be made for affiliation to the Auto Cycle Union in due course. Doubtless the club will have the support of a large number of motor-cyclists, particularly of those who have in previous years been attached to the sporting side of the ordinary cycle.

Teaching Anti-Motorists.

OFTEN on this side of the Irish Sea has the suggestion been made that motorists might teach those who oppose their progress by practically boycotting those towns in which antipathy finds local encouragement. Col. W. J. Bosworth, for instance, has intimated his intention of taking out his licence in Manchester, rather than in the county in which he resides, as a practical protest against the local condition of things. In Ireland, where feeling sometimes rises to a very great height, an interesting decision has been come to in connection with the forthcoming Reliability Trials of the Irish Automobile Club. The authorities of County Waterford are applying to Dublin Castle for a speed limit of five miles an hour in all towns and villages, and for one of ten miles an hour on the open country roads. As a protest against this the Irish Club has decided to omit Waterford from the itinerary of the forthcoming event, and further to urge its members who are not resident in the county to avoid travelling within that area as far as possible. Thereupon the authorities of Galway, in the west, have openly invited the Club to include their town within the route; and this suggestion has been graciously acted upon, while the invitation of the local authorities in County Kerry for the competitors to make a prolonged stay at Killarney has led the Club to arrange that the trial shall have its headquarters for three nights in the vicinity of the Lakes. This gives point to the suggestion that where the local authorities are sufficiently wide awake to their own interest to welcome motorists the compensating revenue can quickly be found to cover any alleged damage that may be done to the roads; but where a distinctly hostile attitude is assumed an opportunity is frequently at hand to teach salutary lessons and to secure in this way a recognition which argument cannot obtain. With

reference to the Irish trials we learn that the classes into which the cars engaged in the trial will be divided are as follows, namely:—

- A.—Vehicles the chassis price of which does not exceed £150.
- B.—Over £150, not exceeding £200 (two seats).
- C.—Over £150, not exceeding £250 (four seats).
- Q1.—Over £200, not exceeding £250 (two seats) if minimum of six entries received).
- D.—Over £250, not exceeding £350.
- E.—Over £350, not exceeding £450.
- F.—Over £450, not exceeding £550.
- G.—Over £550, not exceeding £700.
- H.—Over £700.

A New Competition.

THE Technical Committee of the R.A.C. having been requested to consider the basis of a new competition proposed by Mr. Mervyn O'Gorman, has resolved to carry out competitive engine tests provided forty entries are received. Regulations are to be drafted by a sub-committee for the carrying out of the tests in the maker's own works, and the study of these, even if the competition is not held, will be of service to the makers.

Tourists in Spain should on no account miss seeing the beautiful Cathedral at Valladolid—situated on the borders of Old Castile. The above illustration depicts a Daimler Car in front of the principal entrance.

Motor-cars and Mud Splashing.

MR. H. FERGUSON, of Belfast, recently carried out some interesting experiments with regard to the capacity of the motor-car to throw mud. The test was made on the Lisburn road, near Belfast, the spot selected being where the railway lines cross the road at Lambog. The roadway was swept on the evening before the trial, and in the morning water was thrown over it so as to give the necessary fluidity approximate to the conditions which normally attain in "dirty weather." A screen, 8 ft. wide by nearly 6 ft. in height, was constructed and placed on the side walk. The first test was for the car, when travelling at 15 miles per hour, to pass the screen at a distance of three yards. Under such conditions the average height of the volume of mud dispersed on the screen was one foot. Splashes occurred up to 18 inches of the screen from the ground, but very few appeared above that height. When the speed of the car was increased to twenty miles per hour the well-dispersed mud rose to a height of 3½ ft. Subsequently the car was driven at

twenty-five miles an hour, when the average height to which the mud was thrown was 4 ft. and the maximum 5 ft. 11 in. All these tests were made at a distance of three yards from the screen. The net result was to show that at twenty miles an hour the pedestrians are practically certain to be splashed, and as the speed of the vehicle increases escape becomes really impossible. These tests would suggest to motorists the advisability of slackening pace in towns and places where pedestrians are to be found on muddy roads, so as to preserve their good opinion of motorists as well as not to damage the clothing of those who happen to be within range of the mud thrown out by the vehicles.

Our Deposit System.

WE would again draw attention to the value of the Deposit system, which was inaugurated by the M.C.J. some months ago, and which has proved highly popular with those of our readers who have goods to sell as well as those on the look-out for equipment to their cars or motor-houses. The system has by its simplicity facilitated small transactions, securing both parties against loss, and also giving them an opportunity of satisfying each other with regard to the sale of motor accessories and supplies, particularly those which come into the category of second-hand.

The Roadway as a Playground.

THE terrible tragedy which occurred on Saturday last, on the highway at Staines, has sent a thrill of horror across the countryside of Middlesex, and will probably cause an outcry against motorists such as followed the unfortunate accident in Hertfordshire a few seasons ago. Motorists have frequently called attention to the dangers of allowing the roads to be used as playgrounds for children; they have, through their official organisations, urged schoolmasters and others to warn their pupils against such practices; and a campaign has been waged by the automobile Press against such games as "last across the road" and cap-throwing amusements, in which the youngsters of this generation seem to delight. Despite all this, however, the road continues to be regarded as the proper place in which children can play, heedless of the traffic that may be about, and regardless of the risks to others as well as themselves. Something more is apparently necessary, and the roadway will have to be a prohibited place so far as the recreations of young children are concerned. The police and the road authorities should join not only in issuing notices, but also in taking active steps against its being made use of in that way. In the years that are gone, when a more leisurely state of things prevailed, the grass-grown highway had attractions for the children, who could play in safety as well as in comfort. But nowadays matters are moving—have, in fact, moved—and to indulge in such games as "the last over" is to invite disaster. Parents and teachers have a solemn duty in warning children; but the police have also a duty in seeing that such warnings are properly heeded.

Educating Councillors.

AT the meeting of the Executive Committee of the County Councils Association in London last week it was resolved "That the association urge upon the President of the Local Government Board the importance of facilitating and expediting procedure as to speed limits in populous and dangerous places by county councils being permitted to hold enquiries themselves, and to make regulations for a speed limit of ten miles per hour where necessary, unless the Motor Car Act be amended so as to reduce the speed limit absolutely to ten miles per hour in such places." In view of the persistence with which this Association is endeavouring to secure a reduction of the speed limit, we would suggest that one of the central motoring organisations should arrange that its delegates should have a motor-car run for, say, twenty miles from London in order to demonstrate the unnecessary character of many of their proposals. If, for instance, some of the people who now advocate the ten mile limit as though it were the

utmost possible liberty that could be allowed the motorist, were compelled to keep for such a pace along a wide unfrequented highway in a thinly populated area, they would soon realise the error of their views. A decade ago such practical demonstrations with regard to the merits of the motor-car were great factors in restraining the ardour with which many men "armed with a little brief authority" denounced the mechanically-propelled vehicle. There is still, in a few localities, need for a revival of the object lesson method of instruction.

A Motor Museum.

FROM time to time the suggestion has been made that there should be established in a building in London, generally accessible to the public, a museum showing the advance of the British automobile industry from the time when Trevithick astonished the natives of Cornwall with his early steam car on the roads. So far, however, nothing of a really definite character has been done; hence the welcome that will be given to the idea that is now being realised on the premises of the Royal A.C. The

been too great an inclination among Mr. Snowden's colleagues to regard anything which assisted the motor movement with antipathy.

A Revival at Coventry.

THE spirit of pessimism seems to have settled upon many of the leaders of the motor industry and gloomy foreboding appears to be fashionable in many districts. But, according to a well informed correspondent, there are indications of increasing activity in the motor industry, notably in Coventry, its chief centre. At several of the large factories overtime is being worked, some of the departments being exceedingly busy, while at other works hands are fully employed. This is in consequence of the preparations that are being made for the coming season's trade, which is viewed with considerable confidence. With the general revival in trade and the gradual approach of Easter, makers will be getting busier, though, owing to the unfavourable experience of many companies in 1908, they are moving cautiously, especially as some firms have a fair amount of stock left on their hands.

Constructing the New Test Hill at the Brooklands Track. As will be seen, it is located on the hill facing the Paddock.

Club has received several offers of models of well-known cars for display in the Club House, and the Technical Committee is drafting regulations as to the dimensions, &c., that will be most suitable. An endeavour will be made to secure that all the models are of a uniform size, and in time the Club will thus become the possessor of a museum which should prove interesting to those wishing to trace the history of the automobile movement and to see how the design of cars has altered from year to year. It should not be difficult to make the suggestion retrospective and to secure, ere it is too late, models of some of the vehicles which have done service during the last decade.

A Labour M.P. and the Roads.

IN the county of Surrey, Mr. Philip Snowden, M.P., has been urging that the Government should tackle, in no niggardly fashion, the main roads of the country, and that motor-cars should be used to link up the villages with the railways, in the interests of the small holders of the rural districts. We are glad that at last a Labour member has publicly endorsed the view that motorists have long advocated, for hitherto there has

The Safety of London.

SCAREMONGERS and others who are picturing London as one of the unsafe spots in the world will be interested to know that according to the statistics up to 1907, recently issued by the London County Council, there were only 2,286 persons killed by accidents in that year, as compared with 2,834 in 1901. So that the displacement of horsed vehicles by those mechanically propelled has been followed by a diminution of danger—rather than excess.

HAIR'S MOTOR WORKS, of Victoria, have recently completed a special motor vehicle for Mr. F. C. Bird, an enterprising dairyman in Tasmania, who intends using it for conveying bulk supplies to his various distributing depots. The vehicle has a four-cylinder engine, developing 14-h.p. The milk container is one large cylinder-shaped tank, divided into three compartments, and carries sixty-two gallons of milk. The driver is snugly enclosed from the weather in a neat cabin of the canopy pattern, with glass front and back. The vehicle, which has an attractive appearance, should be the forerunner of many others.

"STEAM IS NOT DEAD YET."

BY OLIVER RIGINAL.

I HAD from quite a boy a great liking for machinery. What boy hasn't? Well, I admit I was but an ordinary, a very ordinary lad, but the mechanical tendency in my character has often since led people to wonder why I did not take it up as a profession. Whatever may have been my reasons, the fact remains that I became an M.D., but I have still my hobby, with which I spend all the moments I can spare from my wife and my professional duties. And, as a doctor, I should prescribe everyone to have a hobby outside his profession; it is a relaxation from professional duties, and relieves the mind from worrying over business. But this is not a prescription which I am going to give you, it is merely an account of a run from Town to Brighton some years ago on a steam car.

When the vehicle in question was put on the market it excited my interest keenly, as I foresaw great possibilities in its future, although in England at the time, as now, the general impression prevailed that steam cars were obsolete. "Why?" I asked myself, "because a well-known American steam car which 'had come to stay,' didn't, and was no longer on the English market?" I put this argument from me; it seemed it was just because they had not "caught on" and because the aristocracy drove petrol

"I was somewhat disgusted when at Dale Hill we all had to dismount and push the thing up, with the steam to help us—it was awful hard work."

cars, therefore petrol cars were the fashion. As the fashion did not concern me at all I determined to buy a steamer.

Consequently I found myself in town one day, the proud possessor of the vehicle, and arranged to learn all about it before returning in it to Brighton.

"Shure and it's Bias himself!" exclaimed a well-known voice, as I was strolling down to the garage the next day.

"Come down to my place for the week-end," I invited, "I'll run you down in my new steamer."

"What!" my friend exclaimed, looking horrified, "shure an' it would be a case of Psh! an' we'd both be blown to the devil!"

I did my best to assure him the danger of being blown up was entirely done away with in these new pattern cars, but he would not be persuaded, and I strolled into the garage thinking what a fool he was for missing the chance of the lovely spin I was so looking forward to.

However, later in the day I met three chums at the club and arranged to drive them down to Surbiton the following day. The next morning was somewhat frittered away in telephoning from the office to the store house and I practically did nothing; then, when we were ready to make a start, we were delayed three

hours by the mud guards not being quite finished, and when at last we did get off the pump failed. I did not say much, as I remembered my first opinion of the advantages and possibilities of steam, but I realised at that moment that to anyone who had not a practical knowledge of machinery, and could not be his own mechanic, a steam car would be more of a burden than an advantage. But for myself and brother mechanics I foresaw many a pleasant hour of grateful occupation in store, and my heart gave a leap. I almost loved that car; it was to be my playmate—my companion. I felt as I can imagine a miner does when he has dug, and dug deep, and at last has "struck ile," and my pulse quickened.

When the pump failed I found it must be taken down and the valves and plunger, &c., cleaned, and it was 3 p.m. before we finally started; but the boiler steamed very badly; we had to keep stopping to get up the pressure, and it took two hours to reach Purley. Being then dark and a nasty drizzling rain having started, which threatened a bad night, together with the fact that we had had no food since an early breakfast, which accentuated the perishing cold, I decided to give up Surbiton and put up at Purley for the night.

I assured my friends that I had done my best to reach Surbiton and was sorry that I had failed, but hoped instead they would accompany me to Brighton the next day. I was more than ever excited about the good time in store for me, but my friends looked at me in amazement.

"You seem quite cheerful about it," one of them remarked, as he tucked into a good raw beef steak.

"Why not?" I asked.

"Do you really think we should ever arrive?" asked another hesitatingly.

"There is a station quite close—you can all take the train back if you prefer to," I said quietly, "I'll stand the fares."

"No, certainly not, old chap, we'll see you through now we are here."

I didn't thank them, I was dreaming of the following days—and days when I could "have it out" with the car. I am a physician by practice, but I felt like a surgeon who was itching to have my patient's 'bleed' and perform an operation.

"Meet me, then, at 9 a.m." I said. "Sharp!" I called out as they retired. They, I believe, spent a very good night—all I remember about it was that I was up betimes in the morning and at 9 o'clock to the moment my friends found me in the garage. They came out looking rather sleepy still, but my bright face evidently aroused them, as would a bright sun shining through one's bedroom window, on a lovely summer's morning.

"Is she all spic and span?" they asked.

"She looks it, doesn't she?" I replied.

"Right oh!" was sung out, and I knew we were ready to start. With suppressed excitement I started to get up steam.

"Eh, what?" exclaimed a voice at my side.

"Did you say we were ready to start?"

"In a moment," I said—but, alas! the pump for getting up the air pressure for the petrol failed. I found it did not fit the nipple on the car and I had to make a fake.

It was some two hours later that we eventually got off amid cheers from the other three, but the steaming was worse than ever, and we couldn't average more than three miles an hour, and even this speed was only accomplished by not using the pump on the engine, but by working the hand pump when we stopped, which was about every half-mile.

In about three hours we arrived at Redhill. My readers probably know the hill into the town. I had been wondering all along the road what would happen when we reached it, and had made up my mind beforehand that I must get rid of the passengers.

"Do you mind walking up this hill?" I said calmly.

One of them was out in an instant.

"Certainly! I would rather," he replied from the road, and I remembered a recent experience of his, when the car he was in had mounted three-quarters of the way up a steep incline, when it suddenly commenced to run backwards down the hill at a terrific speed.

"Jam on the brakes!" he had shouted to the chauffeur, but the reply he heard in faraway tones was:—

"Please sir, the brakes won't 'hact'!" and the result was six weeks laid up—and my friend didn't want to repeat the dose. He didn't believe in the "Mixture to be taken as before."

After that hill, as you may know, there is a nice switchback gradient over Earlswood Common, and having picked up my companions, who were waiting for me, we started with 170 lbs. of steam. Oh! how truly glorious it was as I gave her one lovely swish for about a mile over the common. My heart beat, it was simply splendid as we travelled at thirty miles an hour, and so smoothly! Oh! if only we could have kept it up, but . . . ! We had no time to stop for food and had to be content with biscuits eaten as we went. We took in water three times and petrol once, and at every hill I shed the passengers.

"Do you think we shall arrive before Christmas?" asked one of the party drily. It was December 1st and they were all waiting for me at the top of the hill, shivering with cold in spite of their walk and fur overcoats.

"We shall be in Brighton before midnight to-night!" I answered.

I had been looking forward to Handcross Hill, anticipating the same grand exhilarating sensation we had experienced over

Personally, I was feeling as jolly as a sand-boy, and with my new toy safely in garage I thought I had earned a good night's rest, in preparation of the many hours' work I anticipated in the entire overhauling of it.

Seven years have passed since the events narrated above took place, and I have often had a good laugh over the troubles of that eventful day, when they passed through my mind. After the entire overhauling I got the car in thorough repair and eventually sold it to a gentleman whose business only permitted him to legally go three miles an hour, i.e., an undertaker. It was the best master it could have had, but I do not mean to malign the machine, for I often met that gentleman on the road, and, without saying anything wrong, he was going at the usual speed limit of twenty miles an hour with perfect ease. Her number was C.D.I. When I first had her she might indeed have been called 'Seedy' I.

Since then I have owned six steam cars and one four-cylinder petrol car, and my stud at the present moment consists of two modern steamers, the last word in the application of steam as a motive power on ordinary roads. I can now run up to town and back with the punctuality of a railway train, to visit a brother mechanic and M.D. No! Steam is not dead yet!

Mosmans Bay, a pretty and popular resort near Sydney, New South Wales.

Earlswood Common. In due course we arrived at the "Scene of Accidents," and away we started, but I quickly realised that the brake was not sufficient to keep the car in check, and I had to reverse the engines. I thoroughly enjoyed finding all these defects as it meant all the more pleasure to me later on, but I must admit I was somewhat disgusted when at Dale Hill we all had to dismount and push the thing up with steam on to help us—it was awful hard work. We were very glad of the rest accorded us by managing to make her go for the next two miles; but after that the passengers had to alight again and walk to Patcham, while I got it along somehow.

Then, to add to our many woes, the water gave out. It was just out of sight in the glass, and I thought the pump had failed. so I started the hand pump, but without effect, and then I discovered there was no water in the tank. The fire meanwhile had got the pressure up to 170 lbs., so I put the fire out, again discarded the passengers, and with what steam I had left I struggled on to Preston Park Gates without a fire. The others soon caught me up, and we then set to with a will and pushed the thing home, among the taunts and jeers of the cab and 'bus men. We arrived at the house at 11.30 p.m.—half-an-hour within my stated time, and were greeted with pleasure and relief by my wife, who introduced us to a jolly good "tuck in"—and we needed it.

If I am asked the salient points in which a modern steam car surpasses the early efforts, I would give the following:—The fire tube boiler is retained, but it is larger and uses steam at 450–500 lbs. pressure. There are two engine pumps, which entirely eliminate the necessity for using the hand pump (water). There is also an introduction for careless drivers who run short of water, i.e., a fusible plug to prevent burning the boiler.

Again, all connecting joints are eliminated, so that the escape of steam or water is practically rendered impossible. A simple water gauge is fitted to the water tank, enabling the amount of water to be seen at a glance. And all pressure, instead of being in a big petrol tank, has simply to be maintained in a small one about the size of a 9 in. coffee canister, and the main petrol supply is at atmospheric pressure and can be filled up at will even without turning out the fire.

We can now go forty-five miles an hour on a tank of water, and instead of shedding passengers up Handcross Hill we are hardly aware of its existence.

RETURNS just to hand show that the exports of motor-cars and parts from the United States last year only reached a total of £989,718 as compared with £1,151,394 in 1907. The United Kingdom heads the list with £345,740, Canada being second with £223,108 and France third with £112,089.

GOSSIP FROM PARIS.

French Motor-Car Makers Break Away.

The revolt against the A.C.F., which had been brewing so long before it manifested itself openly at the last Salon, has assumed a yet more aggressive character. The big French manufacturers who led the movement for the suppression of the Grand Prix, and who last December sent their emissaries to all the exhibitors at the Grand Palais with the object of getting as many of them as possible to undertake to boycott the Salon of 1909, have now gone further. They refuse to be "protected" and "patronised" any longer by the A.C.F. and its Syndical Chamber, and are constituting for themselves a Syndical Chamber of Automobile Manufacturers, from which the representatives of all the rather heterogeneous interests represented in the A.C.F. are to be rigorously excluded. None but *bona fide* automobile makers are to be admitted into the new association. There seems to be no doubt of the intention of the manufacturers to separate themselves completely from the two automobile syndical chambers already existing—that of the Automobile Club (the *Chambre Syndicale de l'Automobile et les Industries qui s'y attachent*) and the *Chambre Syndicale du Cycle et de l'Automobile*—but till now no resignation has yet been received by either of them. The desire of these automobile makers to

Touring in France.—A halt on the roadside near Brioude, in the Auvergne.

thwart the action of the Automobile Club is still further demonstrated by the campaign they are carrying on relentlessly against the decision of the official syndical chamber to hold a Salon at the end of the present year, and it is stated on first-rate authority that the new syndical chamber of manufacturers will, immediately it is legally constituted, use all its influence with the Government to prevent it from granting the application of the A.C.F. for the Grand Palais, in which, in accord with the vote of its syndical chamber, it was decided to hold the usual show in November and December next.

How they do it in France.

One after another all the automobile clubs of France are adopting strongly worded protests against the drawing up of *procès verbaux au vol*. The abuses they lead to are intolerable and endless. A typical example of their injustice was recently furnished in the Paris Police Court. A foreigner possessing a motor-car left it in the care of a garage while he went for a tour round the world. During last autumn the manager of the establishment was astonished to receive a legal notice that on a certain day in October a *procès verbal au vol* had been drawn up for excess of speed against the driver of a car bearing the number of his absent foreign client's automobile. Now the vehicle had not left the garage since the month of June. The manager went to the Police Commissary to explain the matter and came

away quite satisfied, especially as he happened to meet at the Police Commissary's office the very *sergent de ville* who had drawn up the *procès*, and who did not seem very sure of having copied the number of the car correctly. The manager believed the accusation had been withdrawn. But imagine his amazement when, some long time afterwards, he received for his foreign client, who is even now absent from Europe, a summons to appear before the police court to answer for the offence of having on October 7th, while perhaps at that moment in Japan, committed in Paris a breach of the regulation concerning speed. Even that was not the worst of it. When the manager of the garage appeared in court in the place of his absent client and tried once more to explain and to prove the impossibility of the offence having been committed by his client or any one using his car, the judge refused to listen to him, because he had not a power of attorney authorising him to represent the supposed delinquent, who was consequently condemned in his absence to pay the usual fine.

The Gordon Bennett Aeroplane Competition.

The C.A.M. (Commission Aérienne Mixte) has taken a wise decision. It has adopted the proposal to hold the Gordon Bennett Cup competition at Bétheny during the Rheims grand aviation week, extending from 22nd to 29th August. The aviators competing for the prize are to cover a total distance over a circuit measuring between five and ten kilometres with no acute angles. The definitive regulations will be published very shortly. The cup will be awarded to the Aero Club to which the aviator covering the distance in the shortest time may belong, but it will not become the property of the club unless it is gained by one of its members in three consecutive years. The money prize of £1,000 is to be handed to the victorious aviator, and other prizes comprising the amount of the entrance fees, fixed at £20 for each machine, and any donations which may be made will be distributed to the aviators coming in second and third.

Entries for the Competition.

It was stated in a circular addressed last week to the French aviators by their Aero Club that the latest day allowed them to make known their desire to be chosen to form part of the trio destined to represent France in the competition was February 15th. At a meeting of the club held last Saturday that date was, however, extended till June 15th. The official note concerning this extension of time also announced that so many French aviators aspire to the honour of representing their country in this great international event that it may be necessary to hold preliminary elimination trials on August 23rd. Though there are at the present moment, so far as I know, only two French aviators—Delagrangé and Blieriot—who have already flown so much as the 12½ miles they will have to cover in the Gordon Bennett competition, no doubt others will before the great day come have proved their ability to do so. Henry Farman is an Englishman, and therefore, though born and resident in France all his life, cannot, I suppose, be a French champion. I have not heard that he has been asked to form part of the English trio or that he has offered to do so. As for Wilbur Wright, I do not know his intentions. He may be one of the American champions.

I understand that the competitors at the Rheims meeting will have the whole week in which to choose the most favourable moment for their performances. There will be at least five competitions—one of duration of flight, one of speed over a measured distance of thirty kilometres (18½ miles), one of speed over a short circuit, one of height, and one for machines carrying more than one person. The local committee, of which Marquis de Polignac is the President, has already in hand no less a sum than £8,000, so the prizes will be worth gaining.

MARNEY.

THE report of the Motor Union Insurance Co., Ltd., for the year ended December 24th, 1908, has just been issued, and shows a net premium income of £52,952. Out of the available balance the directors recommend that a dividend of 7½ per cent. be declared upon the paid-up capital.

THE IMPERIAL FLYING SQUADRON.

HAD he lived until these years of the Twentieth Century, Tennyson would probably have done for the Imperial Flying Squadron what he did for the Volunteer movement in the Sixties by his poem of "Riflemen, Form." For, said the great Victorian poet,

"I dipt into the future, far as human eye could see,
Saw the Vision of the world, and all the wonder that would be;
Heard the heavens fill with shouting, and there rained a ghastly dew
From the nations' airy navies grappling in the central blue."

It is something of that feeling that has led Mr. Pemberton-Billing to give practical evidence of his patriotic purpose by the formation of the Imperial Flying Squadron.

This is to consist of amateurs who, taking up aeroplaning as a hobby, are willing to give their services to their country in time of need. Believing that, in the not distant future, the aerial machine will be a great factor in decisive warfare, Mr. Pemberton-Billing has studied the geography of England and Wales from the point of view of an aerial navigator. He has come to the conclusion that there is one vulnerable piece of flat land on our eastern coast which might tempt the enemy to an aerial invasion; and hence the enterprise, details of which have been supplied us by Mr. C. E. Whitaker, whose enthusiasm for the newest and the highest form of locomotion will have practical vent as supervisor and general director of the flying ground now being established in Essex.

Fambridge, on the Crouch, is the headquarters of this latest enterprise. The little village has a few bungalows, a capital hotel, a post-office and many other conveniences of modern life, and then, looking eastward, there is not a single pimple on the face of the land—all is marshland, and we have a wide view of the river valley and of the battlefield of Ashingdon, where Canute defeated Edmund Ironside. The Romans had a station in the district. It is indeed a dreary grassy piece of country, with scarcely a tree and ne'er a telegraph pole—an ideal place for a "flyaway"—if we may suggest a word that well indicates what Mr. Pemberton-Billing and Mr. Whitaker have in contemplation.

An estate of about 3,000 acres has been obtained, with all the buildings already indicated and a well-built works, which, originally designed for the manufacture of cranes, now promise well as aeroplane sheds. There are two great shops, one 126 ft. by 111 ft. and 75 ft. in height; another 112 ft. by 56 ft. and 30 ft. high. These will have great doors 70 ft. wide and 30 ft. in height, to admit of the aeroplanes which will be housed therein. Then for a distance of about fifteen miles to the sea is a great stretch of the marshes a mile in width, along which the aeroplanes can fly in security.

Those who contemplate journeying towards the skies will be able to indulge their hobby at Fambridge, about seven miles from Southend by road and less than that distance from the railway station at Hockley. At the Aeroplane Colony there will be maintained a squad of men to assist amateurs who, for an inclusive rental, can have the use of a bungalow for themselves, the aeroplane shed for their machines, and plenty of assistance in connection with their flights. Mr. Whitaker is entering into this innovation with zest and all must hope that the scheme will have all the success it deserves. The location is certainly an ideal one for an aviators' experimental ground and should do much to improve the position of Great Britain in the category of nations that are encouraging aerial flight. Free of official restrictions, those who become associated with the Imperial Flying Squadron will be able to develop their ideas along their own lines, so that it will become an important centre for experimental work as well as a useful flying ground.

A 40-H.P. Mercédès car has just been supplied by Messrs. Dueros Mercedes to Prince Akisugawa, the Crown Prince of Japan. The vehicle is fitted with a special seven-seated Roi-des-Belges body, built by the Automobile Carriage Builders, Ltd., of Vauxhall, S.W.

THE ARMOURED HONEYCOMB RADIATOR.

WE are this week able to illustrate the new armoured honeycomb radiator which, as was briefly mentioned in our last issue, is being put on the market by the Horley Motor and Engineering Company, Ltd., of Horley, Surrey. It will be seen that the radiator is built up of a large number of solid-drawn square (in section) tubes of brass or copper. Each row of tubes is separated at the front and rear by strips of tinned brass so made as to embody a series of sharp angled corrugations corresponding to the sides of the tubes. The latter are laid on the strips in such a way that the ends thereof are not flush, but so that those of the tubes are at a point midway across the width of the strip. The strips and tubes, when built up to the required size and form, are then soldered together, hermetically sealing the water space. The object of introducing the strips is to produce a radiator of such a strength as to be capable of resisting heavy shocks without damage and consequently without leakage. Even should some of the tubes be injured as a result of a severe collision the makers claim that the

method of construction is such that anyone able to use a soldering iron can readily fit new tubes in place of the damaged ones.

In addition to the increased water space between the tubes made possible by the use of the strengthening strips, there is another feature in the new radiator to which attention may be drawn; we refer to the fixing of the tubes cornerwise; it will be seen that as the hot water descends it meets a series of deflecting ridges, which divides it up into a series of fine sprays, consequently increasing the cooling efficiency. The armoured radiator, as will be observed from the two patterns depicted in the accompanying illustration can be made in any desired shape or size, and, apart from its strength and other advantages, has a neat and pleasing appearance. The Horley Company are also making an improved form of gilled-tube radiator, the front of which is made to resemble in appearance one of the honeycomb type. In this the tubes can be either arranged vertically or horizontally, as required.

A MAN who was in charge of a heavy motor vehicle on the Staines road, Bedfont, on February 11th, came before the Feltham magistrates, on Monday, charged with being drunk on that occasion. While driving he ran into a troop of horses belonging to the Dragoon Guards, one of which was thrown into a ditch. The prisoner was sentenced to a month's imprisonment in the second division.

A NEW JACKSON CAR.

THE accompanying illustration depicts the latest model of the well-known Jackson cars which Messrs. R. Reynold Jackson and Co., Ltd., of Notting Hill Gate, W., are putting on the market for the 1909 season. As will be seen, the vehicle, what with its long bonnet, its extended dashboard, &c., has quite a racy appearance. As regards the mechanical portion of the chassis, which is known by the firm as their No. 8 type, this comprises a number of detail improvements. The motive power is supplied by one of the latest De Dion 8-11-h.p. single-cylinder engines, with mechanically-operated valves and automatic carburettor. The water circulation is on the thermo-syphon system, no pump being employed; the lubrication is effected by means of a Dubrulle mechanical oiler. The power of the motor is transmitted through a leather-faced cone clutch to the gear-box, which is now located more to the rear, so that access can be had to it below the driver's footboard; at the same time the change in position has enabled a universal joint to be introduced on the shaft between the clutch and gear-box to allow for any want of alignment between the two parts, and to permit of either being dismantled without disturbing the other. The three speeds and reverse motion are controlled by a single lever, and the final transmission is by a cardan shaft and bevel gear to a strongly built live axle. Following modern practice, the

General View of New Jackson Car.

cardan shaft has only one universal joint and is enclosed over its entire length in a sleeve. Other details to which reference may be made are the adoption of three-quarter elliptic springs at the rear and the fitting of ball bearings not only to the gear-box shafts and back axle but to all the road wheels. As showing the attention that has been paid to the details, it may be mentioned that to facilitate starting both a carburettor "tickler" and a half-compression device are provided, the levers operating these being located near the starting handle.

The car is designed for two passengers, and, with its low bucket seats and acutely inclined steering gear, the vehicle combines the appearance of a powerful racer with a machine that is not only speedy and moderate in first cost, but in point of view of the expense of running is well within the means of a very large section of the motoring public. Making a short run on one of the new models in company with Mr. Reynold Jackson a few days ago we were much struck with its behaviour; in fact, so relatively quiet ran the engine and so marked were its "pulling" powers that, except for the prior knowledge, we should have thought the engine was at least a twin instead of a single cylinder.

THE Didsbury Engineering and Motor Works are the proprietors of a new depot and garage which has been established at 20, Wilmslow Road, Didsbury, Manchester.

AN EARLY AERONAUTICAL ENGINE.

IT is interesting to recall the fact that the pioneer French aeronauts were obliged to place their order for an engine with a British firm. In a corner of the modern workshops of Messrs. Hunter and Son, of Lanier Road, Lewisham, who claim to be the "oldest firm of practical motor engineers in the United Kingdom," may be seen to-day an interesting petrol engine, the actual pioneer of its type built for aerial navigation purposes. The engine was built and designed to the order of M. Gaudron for his steerable balloon, which made several ascents from the Alexandra Palace in 1897 and 1898. The motor, which developed 4-h.p., has two horizontal opposed cylinders, the explosion acting on both pistons at the same time. The end aimed at was a smooth running, light and well-balanced engine, and it was admitted by technical experts at the time that this was attained. Mr. Hunter retains to-day many memories of the experiences with the engine. It was suspended by a light steel framework in the car basket and drove a four foot propeller. The balloon had a cigar-shaped envelope and was actually steerable in a calm atmosphere. Mr. Hunter, jun., superintended the working of the motor prior to the ascent, but when the intrepid M. Gaudron invited him to "fly ever so high up on his bonny balloon," to quote the modern ditty, the request was politely but firmly refused. "For one thing," he in-

forms us, "he had only just got married," and motor experiences on land at that time were quite sufficiently exciting and varied for his liking. However, M. Gaudron's flights were attended with good fortune, though in one, as Mr. Hunter recalls, he had a narrow escape through the carburettor taking fire, causing a hasty descent.

MESSRS. HUTCHISON, MAIN AND COMPANY, of the Spring Vale Works, Cowlares, Glasgow, are making a special feature of the repair and retreading of motor tyres. We understand they will shortly introduce a new tyre for motor-cars.

A TEST of the "Avon" pneumatic tyre recently made on the Resiliometer of the R.A.C. gave some very gratifying results. The tyre tested was 880 mm. by 120 mm. and the average readings of three tests were as follows:—At 60 lb. pressure: Yield 1.562 in., Return 16.479 in. At 75 lb. pressure: Yield 1.50 in., Return 16.875 in.

A USEFUL adaptation of the Latil "avant train" or motor fore carriage has been made by the Paris municipal authorities, who are using an arrangement of the kind in conjunction with a street sweeping machine. The whole apparatus is very simple, and the fore carriage can be easily detached from the sweeping mechanism when required to be used in connection with another vehicle.

AERONAUTICAL NOTES.

AT Gennevilliers, France, last week, M. Vaniman made a successful flight on his aeroplane, which is of the tri-plane type.

A SYNDICATE in Madrid is reported to have placed an order for four aeroplanes of the Wright type.

THE British Aeroplane Syndicate, Ltd., has been formed with a capital of £5,000 and a membership limited to fifty persons.

It is reported that the Wolseley Tool and Motor Car Company are engaged on the construction of a new aeroplane.

THE Union Francaise Aerienne is the name of a new society which has just been formed at Toulon with the object of aiding inventors and designers of aeroplanes in developing their ideas.

It is announced that the Aero Club of Vichy (France) will offer a prize of £400 for an aeroplane competition to be held on the new trial ground which is being established near that place.

It is reported that, notwithstanding the objections of his suite, King Alfonso of Spain intends to shortly visit Pau with the view of making an ascent with Wilbur Wright in the latter's aeroplane.

M. ZIFFEL met with a slight accident with his Voisin aeroplane at Berlin on Monday, last week, after making a flight of about six hundred metres. No serious damage was, however, done to the machine.

THE French Ligue Nationale Aerienne has passed a resolution urging the municipal authorities of the principal towns in France to establish landing places and sheds for aeroplanes and airships in the neighbourhood of their localities.

WE learn that arrangements have been concluded between the German Imperial Automobile Club and the German Aero Club with a view to a joint regulation and promotion of all matters relating to aeronautical matters in future.

THE U.S. House of Representatives has reversed its recent decision to make a grant of £100,000 for experiments with war balloons and airships, and ordered the clause relating to the grant to be struck out of the Army Appropriation Bill.

SOME experiments have lately been carried out at Berken-dael, near Brussels, with an extremely novel form of flying machine devised by M. Adhemer de la Hault. The apparatus is of the flapping wing type and is known as an "orthoptere."

M. JACQUES FAURE, a well-known French aeronaut, who has frequently made the journey across the Straits of Dover in a balloon, is reported to be contemplating a journey from Monaco to the Island of Corsica in a small dirigible airship. The distance is, roughly, 115 miles.

THE suffragist attempt to influence Parliament from a dirigible airship on Tuesday was scarcely a success, the great airship navigated by Mr. Spencer, and bearing the legend "Votes for Women," going as far as Coulsdon, and the lady passenger returning to London by motor-car.

THE aeronautical movement is growing apace in Austria, where two new associations have just been formed—the Austrian Aviation Society and the Upper Austrian Association for the Promotion of Aerial Navigation. The first-named has its headquarters in Vienna and the second in Linz.

A NEW arrival at the Issy-les-Moulineaux trial ground, near Paris, is a Voisin aeroplane specially arranged for the testing of different types of aeronautical engines. The first to be fitted to it is one of the E.N.V. 70-h.p. eight-cylinder motors recently described and illustrated in the *M.C.J.*

It is reported that provision is being made in the next Italian Budget for the construction of forty military airships. Six of these are stated to be already completed, while it is expected that no less than eighteen will be available for use in connection with the manoeuvres to be held in Italy during the coming summer.

THE Simms Manufacturing Company, Ltd., are constructing a 50-h.p. six-cylinder Simms engine, fitted with special carburettor and Simms magneto, for use by Mr. S. F. Cody in his new aeroplane. The engine is of special design and construction, and will weigh about 4½ lb. per h.p. The cylinders (bore and stroke 110 mm.) are inclined 120 deg.

THE Aero Club of France is preparing a map of Paris and district for the special use of aeronauts.

MAURICE FARMAN, to whose new aeroplane reference was made in a recent issue, has already succeeded in making his first flight. The trial was made on M. Esnault-Pelterie's private ground at Buc, near Versailles. The flight was one of about 330 yards at a height of from fifteen to thirty feet from the ground.

THE Aero Club of France has now issued certificates designating them "flying pilots" to the Wright Brothers, Henri Farman, M. Bleriot, M. Delagrangé, M. Esnault-Pelterie, Captain Ferber and Santos Dumont. To secure the certificate aviators are required to make a flight, on a closed course, of at least three kilometres without touching the ground.

MR. G. H. CURTISS, a well-known American aeronaut of Hammondsport, N.Y., has gone to Nova Scotia, where he expects to remain a month or more at Professor Alexander Graham Bell's home on Cape Breton Island, assisting the members of the Aeronautical Experiment Association in testing several new machines.

AN extremely novel combination hydro and aeroplane has been designed by M. Roger Ravaud, who has entered it for the Monaco competitions. Not only will the apparatus, which has been named the "Aerocaphe," be able to propel itself on the surface of the water, but it is expected to be also able to fly in the

Front and Side Views of the "Aerocaphe."

air. Superimposed above two long parallel floats are a number of planes having a total sustaining surface of thirty-nine square metres. The propulsion of the vessel is effected by two concentrically-arranged propellers at the rear, working in opposite directions. The motive power will be supplied by a Gnome 50-h.p. engine of the type which has lately been illustrated in the *M.C.J.*

THE German military authorities have decided to establish a new station for aerial warships in the vicinity of Cologne. The sheds will provide accommodation for two airships, which are to be permanently stationed there. The new airship station at Metz, now in course of construction, is expected to be completed in May or June. Two dirigibles, one of the Zeppelin type and the other of the Gross pattern, will be stationed there. Another military airship station has been erected at Friedrichshafen. Including the station at Tegel, near Berlin, the German Government will thus possess in the near future four havens for aerial warships.

THE trouble between the Belgian Aero and Automobile Clubs with regard to jurisdiction over aeronautical matters has been settled. An agreement has been arrived at, to last a year, and afterwards continues by tacit understanding, that the Automobile Club will deal in all matters appertaining to machines of the heavier-than-air type and the Aero Club with balloons, airships and the like. An amalgamation of the Belgian Aeronautical Society with the Aero Club has been effected. The former body sinks its title but its committee retain office, and Count Havelin d'Oultremont, who was President of the Society, is to be nominated for election to a Vice-Presidency of the Aero Club.

Aeronautical Notes—continued.

EFFORTS are being made to organise a demonstration of flying machines on the cycle racing track in Munich, Germany.

SEÑOR SEASATE-LARIOS, Professor of Engineering at the National College at Buenos Ayres, has designed a new flying machine of the ornithoptere type.

HERR WELS is continuing his experiments in Vienna with an aeroplane of the bi-plane type. The machine, which is fitted with a 40-h.p. engine, has, however, not yet succeeded in making any noteworthy flight.

THE Smithsonian Institution of Washington, U.S.A., is planning a "Langley Medal" to be offered as a reward for successful endeavours in aviation, in appreciation of the grand work of Professor Samuel Pierpont Langley.

M. A. VAN DER CHKROUFT, a member of the Aero Club of Odessa, has acquired an aeroplane of the Delagrange type, with which he hopes to shortly make some trial flights. The apparatus is fitted with a Vivinus 66-h.p. motor.

MR. WILBUR WRIGHT is now engaged on the construction of a second aeroplane, which is expected to be ready in three or four weeks. As soon as he has completed the training of his three pupils he is under contract to go to Rome to make a series of flights; no date has, however, been specified.

THE Aerial League of the United Kingdom is arranging a course of lectures on aeronautics to be given at the leading public schools, and is also organising a kite-flying competition for children. The prizes in the latter will be given to the boys who succeed in lifting by means of their kites the heaviest weight in a specified distance from the ground.

A SWISS engineer, M. Auffm-Ortt, of Geneva, has lately completed a new flying machine of the monoplane type. The apparatus, which weighs complete about 4 cwt., is fitted with a 30-h.p. engine. The usual cycle-type wheels employed to enable aeroplanes to run along the ground are replaced by skis about 10 ft. long. Some trials with the machine have already been made on the frozen over lake of St. Moritz.

WILBUR WRIGHT made a flight of about eighteen minutes' duration on his aeroplane, on Thursday last week, in the presence of Mr. A. J. Balfour, who evinced great interest in the machine. On Monday Wright made a flight lasting twenty-one minutes with the Count de Lambert; afterwards he took up the Countess de Lambert for a four minutes' flight, while later Miss Wright ascended with her brother and flew for seven minutes.

THE Aero Club has now issued its rules concerning the Challenge Cup presented by Mr. John D. Dunville, which is to be awarded on January 1st in each year to the member of the Aero Club of the United Kingdom who, having given due notice to compete for the cup, has performed the longest voyage in any balloon, airship or aeroplane during the previous year. The start must be made from some place in the United Kingdom although the voyage may be completed in any other country. The cup will not be awarded for any voyage of less than 150 miles and no temporary descents will be allowed during the trip.

MR. CORTLANDT FIELD BISHOP, the president of the Aero Club of America, has announced that he will give £200 in cash prizes for aeroplane flights in the United States during 1909. The amount will be divided into four prizes of £50 each, and will be awarded to the first four machines making the prescribed distance, the winners also receiving the club silver medal. The competition, which will be held under the supervision of the Aero Club of America, will be open to all aeroplanes that have not in the past made an officially tested flight of one kilometre, or more.

CAPT. WINDHAM hopes to have his new aeroplane over in this country by the end of next week. The apparatus is of the bi-plane type; it is being constructed by the brothers Voisin, and will be fitted with a Duthell-Chalmers 25-h.p. engine. The latter will drive through chains a couple of large propellers. The lateral stability of the apparatus is to be secured not by making one-half of the planes moveable, as in the Wright machine, but by means of "ailerons," or a kind of moveable wing-tips attached to the lateral extremities of each plane. The aeroplane is intended to carry two persons, a pilot and a passenger, two seats being arranged in the centre of the frame.

A NEW aeroplane is being built in Chemnitz, Saxony, by Herr Max Schuler. The machine will be a combination of the Voisin and Wright designs, and will comprise two planes. The sustaining surface of the apparatus is fifty-two square metres.

ACCORDING to the "Temps," excavations are being made on the heights of Chantaine, France, for the foundations of a balloon shed, to be erected there for the reception of the new dirigible balloon, Republic, which has been allocated to the defence of Epinal.

A NUMBER of new aeroplanes are in course of construction in the Marseilles district; one is being built by M. Serrailier and another by M. Combes, of Pertuis. At Martigues M. Rene Bazin is putting the finishing touches to a new flying machine of the flapping wing type.

THE Société des Eleves Industriels de France (5, Rue Champollion, Paris), is organising an exhibition of model aeroplanes to be held in the Galerie des Machines, Paris, from the 22nd to the 28th March next. On the last day a competition will be held as to the best design exhibited.

M. JEAN BAYLAC, an engineer of Bordeaux, is at work on the construction of a new flying machine of the helicoptere type. The apparatus will be fitted with four propellers—two being vertical and two horizontal—as well as a screw. The motive power will be supplied by an engine of 100-h.p.

LA SOCIÉTÉ ZODIAC has recently completed the construction of a small dirigible airship, the feature of which is that it can be quickly dismantled and carried on an ordinary horse-drawn lorry. To this end the car which is suspended from the balloon, and in which the motor and propeller are mounted, is built up in three readily-detachable sections.

THE town of Pau, near which Wilbur Wright is now making flights almost daily, is attacked with "Wright-mania." There are "Wright watches," "Wright brooches," with portraits inset, and "Wrights" in porcelain, an amusing caricature, representing the aeronaut seated in his machine. Picture postcards of him are also in every shop window.

SOME confusion has arisen in connection with the Gordon Bennett aerial contests to be held this year. Two distinct events have been arranged; one is for flying machines of the heavier-than-air-type, and it will be held in France for the first time in August next. The second Gordon Bennett contest is that for ordinary balloons; and, as the trophy last year was awarded to Col. Schaeck, of Switzerland, this year's event will start from Zurich, the race being held about the end of September or early in October.

MR. C. A. CHAPPELL, of New Southgate, has recently patented the designs of a new aeroplane; the apparatus is of the bi-plane type and comprises two superposed supporting-planes connected together by flexible steel or wooden laths. Small movable planes are fixed to the front of the upper and lower planes for steering. This arrangement of the stays allows the planes to move relatively to one another. Auxiliary steering-planes are pivoted to the front of the upper and lower planes. To the rear edges of the latter are attached cords which can be operated separately or simultaneously for steering and balancing the machine, the rear edges of the upper and lower planes being lowered and raised for inclining the machine upwards and downwards respectively. When all the four planes are inclined, they act as a brake for stopping the machine.

ON Sunday last, at Bouy, near Chalons-sur-Marne, Henry Farman flew with a passenger beside him on his aeroplane a distance of five kilometres, and could have prolonged his flight as long as the petrol supply lasted. The performance was a notable one, but the various flights of one, two, and five kilometres made by his pupil, Legagneux, were of yet more considerable importance. After receiving instruction in the aeroplane shed and being made familiar with the working of the machine, Legagneux, who has been engaged by the Austrian syndicate, the purchaser of Henry Farman's transformed aeroplane, to make experiments in Vienna, first watched the aviator operate with it. He was then able to at once mount the machine alone and to fly straight away without any sort of mishap. Legagneux's performance is eloquent, and speaks highly for the aeroplane, the master, and the pupil.

THE SOCIAL WHIRL.

H.R.H. THE PRINCE OF WALES, K.G., who is a vice-president of the R.A.C., will honour the Club with his presence at the annual dinner, on Thursday, the 18th prox. This will be the first time that Royalty has been present at the annual dinner of the Club, although His Royal Highness has previously visited the motor exhibitions, his introduction to such having taken place at one of the Cordingley Motor Shows.

LADY MONTAGU of Beaulieu was, owing to illness, unable to preside at the annual meeting of the Ladies' A.C., held at the Club Room, Claridge's Hotel, Brook Street, W., last week. In her absence Lady Edward Spencer Churchill presided. The report showed a very satisfactory financial position and keen interest taken by members in the lectures and meets which have been organised by the committee. The latest members of the Ladies' Club are the Marchioness of Donegall, the Hon. Mrs. Henry Dennis and Mrs. Charles Clifford. Garage accommodation has been provided for the cars of the ladies in the R.A.C.'s Club House in Brick Street, W., and I understand the committee are somewhat astonished that members have not more generally availed themselves of the excellent facilities there offered.

A PLEASANT time was spent at the Central Hotel, Glasgow, an evening or two ago, when the Dunlop Pneumatic Tyre Company, Ltd., gave a complimentary dinner in honour of Mr. J. S. Matthew, who, as already announced, has become the manager of the Argyll Works at Alexandria, to which, by the way, Mr. A. Davidson has been appointed works manager. Mr. H. L. Richardson, who has succeeded Mr. Matthew at the Dunlop Company, was in the chair, and spoke of the regret of the staff at his departure for Alexandria, where, however, they wished him all prosperity and good fortune. Mr. Matthew received several presents from his old colleagues, and is commencing his career at Alexandria with every token of goodwill both from former and present associates.

MR. A. J. BALFOUR has been visiting Mr. Wilbur Wright at Pau, and taking a keen interest in his aerial flights. The ex-Premier was one of the first of Front Bench Statesmen to become a motorist, and he has subsequently proved a great enthusiast for accelerated travel on land and in air; but, so far, he has not added motor boating to his recreations.

It is not very often that motor-cars propelled by their own power are seen on the stage, owing, perhaps, to the fact that whilst most of the ladies and gentlemen of the theatrical profession can adapt themselves to the small equestrian requirements of romantic plays, few have acquired the technical knowledge necessary to drive a motor-car, with the attendant mysteries of gate gear, clutch, brake, pedals, and starting handles. In the fairy play produced at the Coliseum on Monday, entitled "The Queen of the Fairies," in which the child who scored such a success in "Pinkie and the Fairies" at His Majesty's Theatre is appearing, a motor-car which has actually done a few thousand miles of good road service is used. It is a 16-20-h.p. Imperia, and Mr. Legrand, who takes the part of the male mortal in the play at the Coliseum, had never driven a motor-car up to the morning of February 11th. After ten minutes' instruction he was able to utilise the starting handle, gear levers and pedals with sufficient success to be able to drive on and off the stage, and two hours' further practice sufficed to put him right for the road.

THE first annual Bohemian concert of the motor department of Messrs. A. W. Gamage, Ltd., was held on Friday of last week and was a delightful occasion. In the absence of the head of the firm Mr. Eric Gamage presided, supported by Mr. J. Dunn, Mr. W. A. Vincent, who is taking a keen interest in the doings of the North Middlesex A.C., Mr. H. Johnson and others associated with the establishment in Holborn. During the evening the interesting announcement was made that a company of Territorials is being formed, officered by Gamage men and attached to the 7th City of London regiment.

LOLLIUS

HERE AND THERE.

A FIRE has occurred at the motor repair establishment of Mr. George Paterson, at Dingwall.

THE Duke and Duchess of Connaught and Princess Patricia paid a visit on Thursday, last week, *en automobile*, to Pompeii.

MESSRS. SIMPSON AND SON have acquired the Central Garage in Clerk Street, Brechin, and will carry on business there in future.

MESSRS. BUCKMAN BROTHERS are opening a motor garage in the Alexandra Road, Chesterfield, where they will prove of useful service to motorists visiting the town.

AN advertisement in the "Daily Chronicle" a few days ago notified that "if the motor-car left at 10, King Street, Leyton, in June, 1907, is not owned in seven days it will be sold to defray expenses."

THE Provincial Motor Cab Company having acquired the premises in Bentley Road, Liverpool, of the Liverpool Carriage Company, Ltd., the latter concern is selling off its stock of horses and carriages.

AT 36 and 38, Willesden Lane, Kilburn, Messrs. Crowe and Decrevel have a motor garage and repair works, from which they are able to let motor vehicles on hire, and at which they also keep a large stock of accessories and tyres.

An Automobile Caravan.

The above illustration depicts the automobile caravan used by Mr. N. H. La Grand, a travelling razor seller, of Jacksonville, Fla., U.S.A. Mr. La Grand not only designed his combination workshop and dining and sleeping car but built it and mounted it himself, on an ordinary petrol motor chassis.

THE Alnwick and Berwick Garage and Cycle Company, Ltd., has recently extended its premises in Alnwick and also established branches at Ayton and Belford, the intention of Mr. C. B. Ford, the managing director, being to establish a garage at the latter place ere long.

THE Lamport and Holt Line, who have their headquarters in Water Street, Liverpool, are making a bold bid for the trade of carrying motor-cars to South America and *vice versa*. The company have a splendid fleet with large cargo capacity, and have also excellent accommodation for passengers.

BOTH Cudham and Brasted Hills, Kent, which, on account of their severity and proximity to town, are a good deal used for test purposes, have wintered well. The awkward bend at Brasted entering the certified 1 in 4½ section has been re-metalled, and Cudham is somewhat loose on the bending. Both hills are situated on comparatively unused roads and undoubtedly are the stiffest rises within a fairly wide radius of London.

MESSRS. PUTTOCK AND SON, jobmasters and motor agents, of the White Horse Mews, Guildford, send their motor hire tariff, giving the rates at which they are letting 20-h.p. Dennis cars by the day, week, month or year. The firm are entering into maintenance agreements with owners of cars of good repute, whereby they undertake to supply a competent chauffeur, tyres, petrol, oils, repairs, renewals, insurance, &c., at an annual sum as arranged between the parties.

Here and There—continued.

THE French post and telegraph authorities are about to invite tenders for the transport of the mails between Ajaccio and Vico, Corsica, by motor-cars.

THE latest novelty in motor-car accessories is a bouquet holder for the interior of limousines and other covered cars. They are being made in various patterns, and consist of a crystal cut glass vase, held by brackets of silver, gold, brass or gun-metal.

THE Dee Oil Company, of Chester, who have large offices in Colonial House, Liverpool, under the charge of Mr. R. Crawford, are doing a good trade in Liverpool and district in their lubricating oils, they having lately secured some very large contracts in the city.

THE London and Parisian Motor Company, Ltd., have received an order from the Countess of Clanwilliam for a 30-40-h.p. Hotchkiss landaulet similar to that recently supplied to Her Grace Katherine Duchess of Westminster, which we hear is giving every satisfaction.

WE understand that the Gornall vulcanizer introduced by Messrs. Richard Gornall, Ltd., of Pilling, near Garstang, is proving popular in France, and that orders are reaching the firm from many of the British colonies. This device was recently illustrated and described in our columns, and is apparently meeting with distinct success among motor garages in this country as well as abroad.

THE Perth County Garage Co., of Perth, have just introduced the emergency tyre clip shown in the accompanying illustration.

The device, which is the invention of Mr. W. Lowson, the manager of the company, is extremely simple, and is intended to obviate the inconvenience arising from burst or cut tyres, and to effect a speedy repair. The clips, which are very strong and easily fixed, are made of forged steel and can be had to suit all sizes of rims. The method of using the clip to temporarily repair a burst outer cover is to first cover the burst with a repair band or a piece of old cover, extending from bead to bead round the tyre, then the clip is applied with the turned-in points pressing the edges of the band into the bead. The large

bolt at the bottom is then tightened, drawing the two clamps together and holding the repair band tightly in position.

ACCORDING to a return just to hand 1,416 European built cars were imported into New York last year. The list is headed by 418 Darracq, all but six of which were taxi-cabs, Renault is second with 266, of which 64 were cabs, then follow Fiat with 181, Mercedes with 94, Panhard 72, Delahaye 65 (all but three being cabs), Isotta-Fraschini 40, Lancia 27, Itala 25, Hotchkiss 22, and Lorraine-Dietrich 20. Of British vehicles imported there were five Napiers, three Humbers, two Daimlers, and one each Argyll and Rolls-Royce.

MR. H. SHERLEY-PRICE, the senior partner in the firm of Wheatley Kirk, Price and Company, has written a *brochure* on the "Depreciation of Works and Machinery," with a view of emphasizing to engineering and manufacturing firms generally the importance of dealing with the subject adequately in practical affairs. He lays down as an axiom that all necessary repairs, maintenance or upkeep shall be a charge upon revenue and form part of the charges or expenses before any profits can be earned or declared. Mr. Sherley-Price advocates that a complete valuation should be made and the sums of the various sections entered in the books. An annual inspection should follow in order that the percentage of assumed depreciation should be brought up to date each year. A revaluation at certain periods is necessary, five years being the period suggested. The little work is published by Messrs. J. Davy and Sons at the Dryden Press, London.

ON Wednesday, Mr. Albert House, of the Oak Lane Garage, Bradford, held an auction sale of motor-cars on behalf of the Northern Automobile Company, Ltd.

THE Chinese taxi-cab or "measure-mile-drum-carriage," of which some particulars were given in our issue of February 6th, has been the subject of a lecture by Professor Giles, of Cambridge, before the China Society in London. He has discovered in the dynastic histories of China a full specification of this curious vehicle.

THE Pyrolignite Syndicate, Ltd., has been registered with a capital of £1,000 to enter into an indenture of assignment with Lord Montagu of Beaulieu, Mr. T. Tyrer and Mr. E. Thomas, and to turn to account several patents and processes relating to the manufacture of acetone, charcoal, pyroligneous acid and other substances.

THE Bull Dog Tyre Grip Company, of 230, Westbourne Grove, London, W., have recently introduced a new tyre lever known as the "Bull Dog Grip," to help in the removal or detachment of tyre covers; it is intended to automatically hold the beaded edge in position whilst the usual long levers are being manipulated.

A NEW petrol fire engine, which is the first of its kind to be put into service in the Metropolis, was received on Tuesday at the headquarters of the London Fire Brigade. The machine, which is of Merryweather's patent "Hatfield" pattern, pumps 500 gallons of water per minute and can attain a speed of thirty miles an hour on the level.

THE official trial of the non-skidding properties of the Allen-Liversidge front wheel brakes took place at the London General Motor Omnibus Company's depot, Dollis Hill, on Thursday. On the same day and at the same place a set of Kempshall pneumatic tyres entered by the Kempshall Tyre Company of Europe, Ltd., were also tested for their non-skidding properties.

THE original letters assigned by the Local Government Board to the County of London in connection with the Motor Car Act having proved insufficient to cover the large number of cars that are now being registered, a new index mark, consisting of the letters LD, has now been assigned to the Council. This is in addition to the previous marks of A, LC, LN, and LB.

A two days' motor meeting will be held in the neighbourhood of Buenos Ayres early next month by the Argentine Touring Club. On the first day there will be a race over two laps of a 125 kilometre circuit, while on the second day "the survivors" will be eligible for the contest over five circuits (625 kilometres). It is reported that three Benz, an Itala, a Fiat and a Lorraine-Dietrich racer have already been entered for the event.

HER Highness the Khedivah recently had a somewhat unpleasant motoring experience. She was taking an afternoon's run with the Princess Nazli along the desert road to Suez when the car skidded and came to a sudden stop. Both ladies suffered bruises and abrasions, but neither of them was seriously hurt. The accident happened at a considerable distance from Cairo, and, owing to some derangement of the gear, the car was disabled. It was not until four o'clock the next morning that another automobile arrived to take their Highnesses back to Cairo, they having passed the interval in an old resthouse on the roadside.

UNDER the title "The Story of the New York to Paris Race," an interesting record of the journey of the Thomas car, one of the vehicles which took part in the round-the-world run, has just been issued. The booklet forms extremely interesting reading, showing as it does the wonderful variety of incidents that were experienced in this notable excursion. Apart from the description of the journey, the book is well worth preserving if only on account of the very numerous reproductions of snapshots taken on the trip in the United States, Alaska, Japan, China, Siberia, Russia, and the other countries passed through. These show in an unmistakable fashion the arduous nature of the undertaking which was so successfully carried through by the Thomas car. Messrs. Cloud and Co., Ltd., 124, High Street, Kensington, W., the British agents for the Thomas cars, inform us that they have a limited number of the booklets for sale at the price of one shilling each.

CONTINENTAL NOTES.

Smoke Emission and Car Testing in Paris.

For some time past the police at Suresnes, the suburb of Paris in which a large number of motor-car factories have been established during recent years, have kept an extremely watchful eye on automobiles which, contrary to the law, have emitted too much smoke. As a large proportion of the vehicles have been new chassis from the factories undergoing their road test, the many summonses that have been issued are regarded by manufacturers as a persecution, and they have resolved to appoint delegates to approach the police authorities on the matter.

French Motor-car Imports and Exports.

The imports of foreign motor-cars into France during last year attained a value of only £279,560 as contrasted with £347,040 in 1907. The largest arrivals were of German vehicles, which headed the list with £102,524, Italian being second with £56,480 and Belgian third with £40,320. The exports of French motor-cars also showed a large decline—from £5,774,080 in 1907 to £5,092,000 in 1908. Decreases took place in the shipments to Germany, Belgium, Switzerland, Italy, Spain, Austria, Brazil, and the Argentine Republic. On the other hand, there was a slight increase in the exports to Russia, the United States, Turkey, Algeria and the United Kingdom. According to the French returns the British market was responsible for £2,642,120 last year—or more than half of the total—as against £2,416,400 in 1907.

Police Traps in Germany.

German motorists have at last become sensible of the fact that motor traps and police prosecutions are becoming a nuisance in the Fatherland. They have consequently founded the German Auto League, which will protect its members against unjust police prosecutions and will try to improve the relations between motorists and non-motorists in general, by prosecuting such followers of the sport as give reason for complaint. Foreign motorists travelling in Germany are eligible for membership, the subscription being only £1. The offices are at 100, Koniggrader Strasse, Berlin.

Motor-Cabs in Germany.

The motor-cab is making rapid headway in Germany. Berlin has of course the largest number, being credited with about 2,000. Frankfurt-am-Main has 31 motor-cabs in service, Hamburg 39, Hanover 20, Munich 134, Leipzig 24, Dresden 20, Magdeburg 15, Cologne 31, Breslau 24, and Nuremberg 40.

German Motor-Car Imports and Exports.

According to returns now available, the imports of foreign motor-cars and parts into Germany during last year only attained a value of £655,150, as contrasted with £891,750 in 1907. On the other hand, there was a slight increase in the exports of automobiles from Germany—from £656,150 to £681,250.

The Coupe des Voiturettes Contest.

The accessibility of Boulogne and the popularity of the Folkestone road should alone ensure a record attendance of English spectators at the Coupe des Voiturettes on Sunday, June 20th. Hotel accommodation at Boulogne, Abbeville, Desvres, Amiens and the villages and towns on and in proximity to the course is good and cheap. We travelled over part of the route at the end of last year, and found the going to Desvres very indifferent. The road is narrow in parts, very uneven, and the pavé in the villages is of the worst description. No doubt it will be put into some order for the race, but the first impression of French roads from Boulogne or Calais is disappointing. Not until one gets forty or fifty miles south or inland do they afford anything like good travelling.

Motor-Car Taxation in France.

M. Walckenaer, Ingenieur en Chef des Mines, who was appointed by the French Government to draw up a basis for the taxation of motor-cars according to their horse-power, has just

presented his report. He proposes to deal only with the bore of the cylinders, rating a four-cylinder engine of 85 mm. bore at 14-h.p., 90 mm. at 16-h.p., 95 mm. at 19-h.p., 100 mm. at 21 h.p., 110 mm. at 28-h.p., 120 mm. at 36-h.p., and 130 mm. at 45-h.p. In the cases of two-cylinder engines of the bores mentioned above the horse-power would be halved, while single-cylinder motors would be only a fourth of the power stated.

A Balloon and Flying Machine Meeting in the Anjou district.

Having been disappointed in losing the Grand Prix motor race, the representatives of the Anjou district of France are now actively engaged in the organisation of a series of aviation and aeronautical fetes, to extend over a fortnight in August or September next. The Municipal Council of Angiers has decided to transfer the £1,000 it had voted for the Grand Prix to the new programme. The Aero Club de l'Ouest is taking an active part in the scheme, and has asked the Aero Club of France to hold some of its competitions in the Anjou district, with the view of assuring the success of the meeting.

Belgian Motor-car Imports and Exports.

The value of the foreign motor-cars and parts imported into Belgium during last year amounted to only £144,904, as compared with £174,948 in 1907. On the other hand, there was an increase in the exports of Belgian motor-cars and parts from £439,656 in 1907 to £449,372 last year.

The Lorraine-Dietrich Car in service between Nice and Peira-Cava.

Miscellaneous Items.

A Motor Cycle Club, the first of its kind in Russia, has just been formed in St. Petersburg.—Under the title La Chambre Syndicale des Negociants en Automobiles, a new association has just been formed by dealers in second-hand motor-cars in Paris.—The annual motor-car race between Moscow and St. Petersburg is to be held on the 26th and 27th of May next.—Count Andrassy, the president of the Hungarian Automobile Club, has just placed an order for a Fiat 50-h.p. car.—The Mid-German Automobile Club, of Eisenach, proposes to organise a motor reliability trial in August next.—Tenders are about to be invited by the French post and telegraph authorities for the transport of the mails between St. Rambert-sur-Rhone and Anneyron (Drome) by motor-cars.

L'Aviation est a l'ordre du jour.

Nous avons aperçu ces jours derniers, dans un grand magasin de nouveautés, où avait lieu une Exposition de blanc, un monoplan construit sur les modèles les plus récents, en... percale, linon, mousseline, toiles, etc. Au milieu, un mannequin figurant l'aviateur, la main sur un levier de mise en marche. Il ne manquait que le moteur. De nombreuses personnes s'arrêtaient devant la vitrine du magasin en question, qui, s'il a voulu s'attirer un gros succès de curiosité, a parfaitement réussi.

MOTURING ACCESSORIES.

A Useful Pocket Knife.

The "Contact" pocket knife is a useful pocket companion, recommended by the Bridgwater Motor Company. It consists of a cutting blade, screwdriver, platinum file, gauge for sparking plug points, inch rule, and a millimetre rule. About $3\frac{1}{2}$ in. in length, it is a really serviceable instrument, that, supplied in a leather case, should prove a popular line with all who drive motor-vehicles.

A Useful C.A.V. Combination.

Among makers of electrical fittings for automobiles Messrs. C. A. Vandervell and Co., of Warple Way, Acton Vale, are entitled to mention for the excellence of their productions. In Figs. 1 and 2 we illustrate

Fig. 1.—C.A.V. Combined Lamp.

their combined steering pillar lamp, tail light indicator and inspection lamp, the former sketch showing the device fixed in position and the second depicting it when detached for service as an inspection lamp. The combination consists of a universally jointed lamp fixed to the steering pillar. It can be used in the ordinary way for the inspection of signposts, lubricators, gauges, &c. When required for use under the bonnet it will be found instantly detachable. The special serrated joints cannot shake loose and the whole fitting is strongly made and well finished. In the separate circular switch device, which is connected in circuit with the tail lamp, a small relay is incorporated. This is so arranged that should the electric tail-light fail at any time the lamp on the steering wheel instantly

Fig. 2.—C.A.V. Combined Lamp detached for inspection work.

lights up. If kept in the position shown it will readily attract the attention of the driver. Thus, in serving a triple purpose, the C.A.V. combination should form part of the equipment of every up-to-date motor-car.

The "Marathon" Foot Pump.

An ingenious foot-operated tyre inflator, invented by Mr. H. T. Hutton, has just been put on the market by the United Motor Industries, Ltd.; it consists of a frame adapted to lie on the ground, and to which is attached a tyre pump and its operating mechanism; the latter consists of a series of pivoted levers and a pedal. The connection being attached to the valve, the pump, which has a barrel of unusually large diameter, is placed on the ground, and the operator, retaining an upright posture, simply presses the pedal down with one foot, causing one of the levers to travel along the slide provided, carrying the piston rod with it and thus sending out with great force the air from the pump to the tyre. The pedal then recovers its first position by means of a spring, which comes

into action the moment the operator ceases to press with his foot. When the tyre is inflated, the barrel of the pump can be folded into the frame, and the levers pressed down, the apparatus then occupying but a very small space. It is claimed that by means of the "Marathon" pump a tyre can be inflated more rapidly than usual and with less exertion on the part of the operator, there being no stooping or back work necessary.

The Millership Motor Alarm.

The Moseley Motor Works, of 129, Alcester Road, Moseley, Birmingham, have introduced a new exhaust whistle. It is known as the Millership Motor Alarm, and has been designed to meet the demand for a means of giving warning of the approach of a motor-car without the objectionable noise of the ordinary exhaust whistle. It is self-contained, instantaneously operated, and can be fitted to any car without trouble.

Economy in Water.

In Fig. 3 is illustrated the Anti-waste automatic spraying nozzle brought to our notice by Messrs. A. W. Gamage, Ltd., of Holborn, E.C., as a useful accessory for all who are supplied with water through a meter. It

Fig. 3.

will be very handy for motor and carriage owners, garage proprietors, and all who use water in any quantity. Its employment obviates all waste by men who, while washing the car, may leave the water running to attend to some other duty. The pressure on the button by the thumb to open the valve is all that is required to operate the device, while the supply is shut off immediately the nozzle is released from the hand.

Sheet Metal Dashboard.

Among the specialities of the Coventry Motor Fittings Company, of Far Gosford Street, Coventry, is the sheet metal dashboard illustrated in Fig. 4. This is made in a standard size of 30 in. high and 40 in. wide, with a radius curve of 6 in. It is constructed in strong gauge tinned steel for painting, with a brass beading round the edge. A good feature of the device are the small cupboards at the sides, the

Fig. 4.—The C.M.F. Sheet Metal Dashboard.

doors fastening with small spring locks. If desired, the dashboard can be devised so as to form petrol and lubricating oil tanks in the upper portion; it can also be made with the bottom corners to come down below the frame, and curved to match the top corners. While the Coventry Motor Fittings Company are making their excellent speciality in the standard size already referred to, they are prepared to make it in any size according to the special requirements of customers.

A Catalogue.

From the Universal Imports, Ltd., of 10, Wilmington Square, Rosebery Avenue, London, W.C., comes a catalogue of their motor accessories, which includes the Eclipse patent lens. This can be fitted in place of the ordinary glass on any motor-car lamp, effectually preventing dazzling and the blinding glare often associated with such lamps. The Bullard speedometer, several types of tyre-holders, exhaust whistles, sirens and radiators are described, as well as the Black emergency wheel.

MESSRS. NORBURYS, LTD., of 39, New Bridge Street, Strangeways, Manchester, are agents for Manchester and district for the Ariel cars.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

AVOIDING BROMLEY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I write with the object of warning motorists to be careful of Bromley. I was fined £5 and 11s. costs or two months' imprisonment for exceeding the ten mile speed limit at Bromley.

There are several ways for motorists leaving the West End of London for Sevenoaks to miss Bromley. They should cross Chelsea Bridge to Clapham Common, then follow the main road to Tooting, Mitcham, Croydon, West Wickham, and Hayes Common, where the road joins the Bromley-Sevenoaks road just south of Farnborough.

This road is a very good way out of London, and there are not so many trams as on the way out *via* Camberwell, Lewisham, Catford, &c.—Yours truly,

H. W. THOMPSON.

same fault, viz., exhaust valve seat cracked. My own Oldsmobile is in the same state, and has been so for over three years. However, it does not make any difference to the speed or power of the car. The reason for this is because the crack is very small and does not allow the compression to leak through. This may not, however, be so in every instance. My advice in these cases is, providing the compression is good, to leave it alone, as it does not affect the power, and to try to remedy the crack means much trouble and expense.”]

THE PRINCIPAL CAUSES OF ROADSIDE STOPPAGES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Concerning “Buxtonian’s” letter as published in the *M.C.J.* on the 6th inst. we are of opinion that the principal causes of roadside stoppages are tyres. We cannot agree with him that the causes are

The Northern Games at Stockholm.—One of the Cars in the Kilometre Speed Trials.

CONCENTRIC VALVES FOR PETROL MOTORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In following the interesting descriptions you have recently been publishing of new petrol motors specially designed for use for aeronautical purposes, I have been struck with one feature. I refer to the adoption of concentrically arranged inlet and exhaust valves. There have been many attempts to introduce these in connection with engines for use on motor-cars, but hitherto the idea has been somewhat frowned upon by automobile designers. Personally, the idea has always struck me as a good one, and it would seem that aeroplane constructors are about to lead the way in more than one direction.—Yours truly,

INGENIERO.

A CRACKED VALVE SEATING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The outlet valve seat of my Oldsmobile has a slight crack in it; do you think this would affect the speed? I shall be much obliged for any information you can give me on the matter.—Yours truly,

OLDSMOBILE.

[One of our contributors to whom we submitted the above letter writes:—“I have had four Oldsmobiles through my hands, all with this

through the men, as we have found that the men are improving with the car, and a great percentage of the stoppages are as mentioned above.—Yours truly,

M. GEORGES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the letter which appeared in the *M.C.J.* of the 6th inst., we beg to say that we consider that the causes of roadside stoppages are of a fairly diversified nature, and that each type of car has its pet weakness. If one asks the question propounded of a man used to any one motor-car, the chances are that his stoppages are due to the same causes as trouble other people driving similar vehicles. We ourselves still attribute a very large share of road stoppages to tyres. Bad charging of accumulators is a fruitful cause of trouble, causing the current to fail rapidly and also spoiling the plates. Switches with wobbly contacts, and earth wires with unearthly leanings, are among fairly frequent causes (as far as ignition goes) which bring cars to an involuntary stop.

Actual breakages, either of the engine or gears, are happily getting rare nowadays, nor do we think that seizures for want of lubrication can be accused to any great extent, in comparison to the more trivial matters we have above indicated. At night time quite a lot of people are brought to a standstill by failure of their lamps. It is our emphatic opinion that most roadside stoppages would be avoidable if a more thorough inspection

were made before starting out, and if some drivers were not content to "chance things" which they know are not in apple-pie order. The parable of the foolish virgins is clearly applicable to the majority of roadside stoppages, if their causes are analysed; at least, that is the experience of—Yours truly,

For Acer, Ltd.,
A. E. S. CRAIG.

"A FRIEND IN NEED IS A FRIEND INDEED."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should esteem it a favour if you would kindly insert the following for the benefit of any motorist who may by chance happen to be placed the same as I was on Sunday, the 7th inst. I was motoring from Chatham to London, and had the misfortune to break my chain at Blackheath, and it looked as if I was in for a night out. However, my son and I set out to look for a motor garage or firm of engineers of some description, and, after finding two or three, I was disgusted to find that as it was Sunday they refused me the loan of tools and labour, although I was willing to do the work myself. After leaving the aforesaid places a kindly policeman directed me to Mr. H. W. Phillips, Motor Garage, 165, Shooter's Hill Road, Blackheath, and, although this gentleman was dressed for a walk, he at once rolled up his shirt sleeves and repaired my chain and sent me on my way rejoicing. Should any other motorists happen with misfortune when in that district they cannot do better than call on Mr. Phillips, where, as I have shown, they will be promptly attended to.—Yours truly,

GRATEFUL.

Mr. V. W. Eyre, of Nuneaton, at the wheel of his Weigel 40-h.p. Car.

A RECIPE FOR BRASS POLISH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a regular reader of the *M.C.J.*, I often see some very useful notes in its columns. I should be very pleased if you could give a recipe for brass polish, either paste or liquid, so as to make my own, as I have a lot of brass-work under my care.—Yours truly,

H. HOLLIDAY.

[We think our correspondent would find it cheaper in the end to buy his brass polish ready prepared. We append, however, two recipes for making the same: (1) Three parts of oxalic acid dissolved in 40 parts of hot water, adding 10 parts powdered pumice stone, 12 parts soft soap and 12 parts of a fat oil. Apply with water. (2) Rottenstone, 4 oz.; powdered oxalic acid, 1 oz.; sweet oil, 1½ oz.; spirits of turpentine of sufficient quantity to make a paste. Use oil of turpentine to apply.]

MAGNETO IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if you would explain the difference between high and low tension magnetos? I mean the difference in working parts and the systems with which they are used. I think a great many other readers of the *M.C.J.* would be interested in the explanation, especially now that magneto ignition has become so popular. I have been told that low tension magnetos can only be used with make-and-break ignition. Is this correct?—Yours truly,

NEW HAND.

[The simplest form of magneto is the low-tension, which consists of a number of permanent horseshoe magnets and an armature rotating be-

tween their poles. As the armature cuts the "lines of force" of the magnets an electrical current is set up in its coils, and this is collected by a suitable brush. In this form the magneto is generally used with a make-and-break device, but it could be used with ordinary high-tension sparking plugs in connection with a contact-maker and an induction coil or a contact maker, single coil and high-tension distributor. As a rule, however, when this type is used with ordinary sparking plugs the contact maker and distributor are mounted on the magneto, and it is then usually called a "high-tension" magneto. This name is, however, electrically incorrect, for the magneto really generates only a low-tension current, which is then transformed by a separate coil. A true high-tension magneto, on the other hand, has a second winding on its armature which takes the place of the coil, so that its current when collected for distribution is already at a high tension.]

THE DAIMLER PATENTS.

Writing with reference to the letter of the Mercedes-Daimler Company, Ltd., in our last issue, Messrs. Jarrott and Let's, Ltd., say:—"Our position is quite clear. The Mercedes-Daimler Company wrote us a letter claiming certain patent rights, and as we believed other firms had received a similar letter we placed the matter before the Society of Motor Manufacturers and Traders for its investigation, at the same time advising our friends in the trade and suggesting united action after the society had given its report. This—to us—very proper course, appears to have considerably ruffled the Mercedes-Daimler Company, and anyone not acquainted with the facts, reading its letter, might suppose that we were endeavouring to make terms with it at the same time as we are trying to obtain a united action by the trade, and such suggestion we wish most emphatically to deny. Two years ago one of the directors of this Mercedes-Daimler Company, namely, Mr. Harry J. Lawson, called upon us and informed us that his company was then entitled to the full use of the name 'Mercedes,' and as we were contemplating the building of a car to be described as 'Mercedes,' coupled with some other name, we eventually paid the sum of £150 for an option for a right to the name of 'Mercedes,' with full use of any patents which might exist. We eventually came to the conclusion that the suggested agreement was of little value and dropped the whole matter, and we have never built cars either on Mercedes or any other lines. Regarding the validity of the patents, the title of the Mercedes-Daimler Company, Ltd., or the value of the device it claims to control, we know nothing. These are matters which are being enquired into by the Society of Motor Manufacturers and Traders, and we think the trade may remain perfectly calm until the investigations of that body are complete."

MR. J. E. HODGKIN, the hon. sec. of the North-Eastern A.A., is warning motorists against purchasing sparking plugs from an itinerant salesman who has recently been in the North of England representing himself as an agent for a firm in Paris, and selling the articles at a very substantial advance upon their value.

AUTOMATIC CAR LIGHTING AND BATTERY CHARGING DYNAMO.—Messrs. S. Bottone and Son, of Wallington, Surrey.—"Having seen a letter in the *M.C.J.* from Mr. T. Jenkinson, re electricity for car lighting, wherein mention is made of the Phi dynamo, we think it would not be out of place to mention that we have an English dynamo which we claim compares favourably with that of our worthy French competitors." We hope to refer to the device more fully in a later issue.

THE COST OF UPKEEP.—The Long Acre Autocar Company, Ltd., write:—"We notice in a recent number of your journal a letter from Mr. R. J. Sefton re the cost of upkeep, and we think that we provide an answer and a way out of the difficulty. By our new guarantee scheme we provide that the purchaser of a car through us is absolutely safeguarded against any other expenses than those occasioned by the requirements of the car in petrol, lubricating oil, and the charge for insurance. We publish a very full explanatory pamphlet of this guarantee, which we shall be pleased to forward to any of your readers who are interested, and who will favour us with a post card application. But, above all, we wish to emphasise that for 5,000 miles Mr. Sefton will be free of upkeep expenditure, whether he purchases from us a two-cylinder 10-h.p. car or a four-cylinder side entrance 16-20-h.p. car, and that he has the option of renewing this guarantee for a further five thousand miles upon payment of a sum stated in the guarantee form."

FROM the L. S. Starrett Company, of 37, Upper Thames Street, London, E.C., comes a copy of the latest catalogue of their fine mechanical tools. The name of Starrett is a world-wide one in connection with micrometers, gauges, calipers, rules, &c., and the list is one which should be of considerable interest to motor mechanics of all classes.

A COPY of the catalogue of the Pierce-Arrow Motor Car Company, of Buffalo, U.S.A., the successors to the George N. Pierce Company, is to hand. This is a very elaborate production, and as regards the illustrations is a striking example of the printers' art. Full particulars are given of the various models of Pierce-Arrow cars, which comprise 24-h.p. and 40-h.p. four-cylinder, and 36-h.p., 48-h.p. and 60-h.p. six-cylinder. Practically all the important components of the vehicles are illustrated, while the full-page coloured plates of the different types of bodies that can be fitted to the chassis are amongst the finest we have so far come across.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Mid-Staffordshire A.C., with a membership of eighty one, has become associated with the R.A.C.

BROOKLANDS.

THE test hill which it was recently proposed should be constructed at Brooklands has now been begun. The gradients, as approved by the Royal A.C., are 1 in 8 for 35 yards at the bottom of the hill, 30 yards of 1 in 5, and 50 yards of 1 in 4 at the top. The hill, which will be straight, will be approachable from a flat of 200 yards.

NORTH MIDDLESEX.

THE first meeting of the newly-elected committee was held at the club's headquarters, the Great Northern Hotel, King's Cross, on the evening of Thursday of last week, when Mr. W. A. Vincent occupied the chair.

Mr. A. C. Denham was elected chairman of the club for the ensuing year, and Mr. W. A. Vincent vice-chairman.

The committee agreed to share with the R.A.C. the cost of erecting a special illuminated signal, which is to be placed in the main road at Wood Green at a dangerous point where the cross-roads are completely intersected by tram lines.

Professor Lambert urged the entrancing claims of the automobile, and how, now the ladies insisted on their husbands investing in one, he remarked that their wishes could be gratified at a very low figure, and instanced that cars could be purchased for as little as £10, and how even with such a mount enjoyment and experience could be obtained. Stress was laid on the advantages motorists obtained by uniting together, especially now that persons in high places had their eyes on the "motorist's nest," and how union might prevent and ward off possible future further taxation.

Mr. Rees Jeffreys, the secretary of the Motor Union, replied for the ladies and visitors.

An enjoyable musical entertainment was provided under the direction of Mr. Fred T. Daniels. After the health of "The President" had been drunk with great enthusiasm, the dinner concluded with the toast of "The hon. sec.," Mr. Leonard Beadle.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

A PAPER is to be read before the London Branch of the Graduates' Section, on Tuesday next, at 1, Albemarle Street, Piccadilly, London, W., by Mr. F. Thomas, on "Change-speed Gears." The following is a digest of the paper:—To effect changes of speed in a motor vehicle the speed of the engine itself may be varied. Over a considerable range, however, the

Motor Touring in Egypt.—On the road between Cairo and the Gizeh Pyramids.

[Allgemeine Automobil Zeitung.]

Messrs. Denham, Vincent, and Barber were appointed to represent the club on the R.A.C. General Committee.

Two new members were elected, bringing the total membership up to 114. The district which the club covers is the whole of the northern portion of the county of Middlesex, i.e., north and east of Uxbridge and Kilburn, and any motorist or motor-cyclist living inside this district is invited to communicate with the hon. secretary, Mr. J. Thos. Barber, Medina, Hardwicke Road, Palmers Green, N., who will gladly forward particulars of all the advantages offered by the club.

BLACKHEATH.

THE annual dinner of the Blackheath Automobile Club was held on the 11th inst. in the Oak Room of the Trocadero Restaurant, London, W. There was a good attendance of members and friends under the genial chairmanship of the President, Col. H. C. L. Holden, R.A., F.R.S., who was supported by Professor Carlton J. Lambert, M.A., and Mr. Alfred Roberts, F.R.I.B.A.

After the usual toasts had been enthusiastically honoured, Colonel Holden pointed out the advantages of belonging to such a club as the Blackheath Automobile, the various meets that had been and would be held under the auspices of the club, and how in future hill-climbing contests could be held on the shortly-to-be-erected hill at Brooklands.

power of the engine is proportional to its speed. It often happens that the greatest power is required at a low speed, e.g., in hill climbing, and hence it becomes necessary to adopt some form of change-speed gear independent of the speed of the engine. The two principal methods in use in England are those known as the sliding gear and epicyclic gears respectively. Speed reductions are proportionable to each other. With a four-speed gear the proportions are generally as follows:—First speed is a quarter of fourth speed; second speed is half of fourth speed; third speed is three-quarters of fourth speed. The best material for gear wheels appears to be forged steel, case-hardened. An addition of 3 per cent. of nickel considerably improves the qualities, test properties, and facilitates lighter construction. For gears always in mesh, however, soft metal can be used and tends to silence. Sliding gears have to a certain extent superseded all other kinds in England. This is rather surprising, especially in the case of motor-buses, where, owing to the great number of changes that have to be made, a great number of renewals and repairs are necessary. The necessity for "striking-in" has been obviated by a system using a separate clutch for each gear, and keeping each pair of gear wheels constantly in mesh. The shock when changing gear is then borne by the comparatively massive jaw clutches. Examples of this are the Renault and Argyll. Epicyclic gears were used by some early motor engineers and are being revived at the present time. A gear of this kind must have (a) A sun or central wheel; (b) one or more plane-

tary wheels, revolving about a ; a fulcrum wheel. Consideration will show that for a 2 to 1 speed the sun and fulcrum wheels must be the same size, and this is the limiting case. In practice 5 to 1 is the working limit. By adding extra wheels to the epicyclic trains the range of reduction may be extended, but the gear-box becomes more complicated at each step. Friction brakes are generally used for holding the cases or drums stationary to obtain the various speeds. A common complaint against planetary gear is that these friction bands do not completely release themselves when out of action.

HERTFORDSHIRE.

THE Hertfordshire County A.C. has held a very successful annual general meeting, at which Mr. Sidney J. Ellis was elected chairman for the year, and Mr. J. E. Greenman secretary, in place of an honorary secretary, the work having become too much for an honorary officer.

BRITISH MOTOR BOAT.

MR. G. F. BESTIC, who is returning to Australia next week, has presented the British Motor Boat Club with a challenge bowl to be raced for by boats having engines up to 100-h.p. The event will be held annually at Burnham-on-Crouch. The race is to take place under the British Motor Boat Club rules for the time being in force, and hydroplanes, under the club's definition, will not be eligible. There will be no time allowance.

The annual dinner of the British Motor Boat Club was held at the Trocadero Restaurant, London, on Friday of last week, when about 150 members and guests sat down under the chairmanship of the Admiral, Admiral Sir William Kennedy, K.C.B., and amongst those present were the Marquis and Marchioness of Ailes, Lord Angus Kennedy (Commodore of the Scottish Marine Motor Club), Mr. W. Miall Green (Commodore of the British Motor Boat Club), Mr. L. M. Waterhouse (Vice-Commodore of the British Motor Boat Club), Mr. F. May (Rear-Commodore of the British Motor Boat Club), Mr. O. B. Colls (hon. treasurer of the British Motor Boat Club), and Mr. C. H. Holland (Commodore of the Burnham Yacht Club). Col. Bosworth proposed the toast of "The Club," to which the Admiral responded. He said motor crafts might prove of enormous value as despatch boats, especially if the owners made a study of our coast, the currents and tides. He had written to the Admiralty on the subject, and that morning had received a reply to the effect that the matter was under consideration.

During the evening the Marchioness of Ailes presented the cups and trophies secured by members of the club during the past season. These awards, which numbered thirty-seven in all, made an attractive and much-admired display.

MOTOR YACHT CLUB.

THE following are the provisional dates for the principal Motor Yacht Club meetings for the current year:—Saturday, May 29th, and Monday, May 31st (Whitsuntide); Friday, July 2nd, and Saturday, July 3rd; August 12th, 13th, and 14th (Annual Regatta); and September 17th and 18th.

The annual general meeting of the Motor Yacht Club will be held on Friday of next week, when considerable progress will be reported.

Nearly eighty candidates have been elected to membership, and the popularity of the "Enchantress" is demonstrated by the fact that 60,000 meals were served on board during the year.

SCOTTISH.

A REPORT of the papers read and of the discussions which took place at the Conference between the Road Surveyors' Association of Scotland and representatives of the Scottish Automobile Club, in the Central Hotel, Glasgow, recently, on the subject of the results and recommendations of the International Road Congress at Paris in October, has now been printed in pamphlet form (40 pp.) and a copy will be sent to any member of the club on application to the secretary, at 163, West George Street, Glasgow.

At a recent meeting of the Executive Committee a communication was read from Mr. W. E. E. Baxter relative to his scheme for the provision of discs for deaf cyclists, and it was agreed to recommend the approval of the same, and also that due regard on the part of motorists be given to the exhibition by cyclists of such discs, provided satisfactory steps are taken to ensure that they are issued discriminately and only to appropriate persons.

The secretary intimated that Mr. W. H. Cox, of Murthly, had gifted to the club for the library of the prospective club-house a considerable number of bound volumes of the *M.C.J.*, *R.A.C. Journal*, and other books, and the best thanks of the Club have been conveyed to Mr. Cox for his gift.

THE Bradford A.C. has now a membership of ninety-nine, having made an increase of twenty-two during the past year.

MR. A. BARLOW has been elected chairman of the committee of the Nottinghamshire A.C. for the current year.

THE Motor Union enrolled 328 new members during January. The funds in hand at the beginning of the year 1909 amounted to £12,000.

THE Bowring Petroleum Company, Ltd., of 5 and 6, Billiter Avenue, London, E.C., are introducing a new motor spirit bearing the name of "Mex." The supply is drawn from the Mexican wells owned by the well-known firm of contractors, Messrs. S. Pearson and Son, Ltd.

CASES AGAINST MOTORISTS.

A FINE REDUCED.

The chauffeur of Mr. Lewis Harcourt, the First Commissioner of Works, was summoned by Mr. Plowden, at Marylebone, for driving his motor-car at a speed of more than twenty miles an hour. He was fined 40s., which was subsequently reduced to 20s. on a gentleman representing Mr. Harcourt explaining that this was the first time his car had been stopped or his speed called into question.

NO RECEIPTS AT POLICE COURTS.

Stanley Gilmour, of Kensington, was fined £2 and 8s. 6d. costs, at Kingston, for exceeding the ten mile speed limit in Richmond Park. Defendant wrote out a cheque for £2, which was refused, as it did not include the costs. Then he wrote another, which was also refused, as it was torn in two pieces in being separated from the counterfoil. With great deliberation he wrote a third, and then demanded a receipt. He was told he could not have a receipt, but could have his liberty, and left the court remarking, "It is very good of you."

A HARD CASE.

When a chauffeur, named Joseph Blackburn, of Shepherd's Bush, was summoned, at Kingston, for failing to produce his licence for endorsement after a conviction for exceeding the speed limit last month, his wife appeared, and produced the licence and the fine, amounting to £10 and costs. As she paid the money she declared that her husband had to sell most of his clothing, and that she had to dispose of all her rings to get it together.

PASSING TRAMCARS.

At the Bradford City Police Court, on Friday of last week, John Holmes pleaded guilty to a technical offence under the Motor Car Act, and was fined 10s. and 11s. costs. The offence in question was that of passing a "carriage" proceeding in the same direction on the wrong side, and the case had been several times adjourned pending an appeal in another case as to whether a tramcar was a carriage within the meaning of the Act. As the High Court has held that it is, Mr. Holmes had to submit to the decision. The Stipendiary pointed out that now the law was settled it must be obeyed until it was altered.

A MOTORIST DISCHARGED.

At Sussex Assizes, on Saturday, before Mr. Justice Bucknill, Arthur Campbell was charged with causing grievous bodily harm to Henry Catt, at Ovingdean, near Brighton, on May 17th last. About midnight on the date in question Catt was cycling home, and when descending a hill he observed a car, driven by prisoner, approaching on the wrong side of the road. Prosecutor shouted, and was in the act of dismounting when the car dashed into him. The occupants of the car felt a jolt, but having felt a similar thump on the outward journey, they proceeded to Brighton, thinking they had run into the bank. Arriving at Brighton, it was found the lamp and top part of the radiator were broken, and two of the motorists returned to the spot where the jolt had been felt. There Catt was found badly hurt. He suffered from concussion, broken ribs and smashed hand, &c. Prisoner pleaded that the night was so foggy that he could not see many yards ahead, and was quite unaware that he was on the wrong side of the road, or that he ran into Catt. There were five lighted lamps on the front of the car. His lordship stated that the jury must consider whether the accident was due to prisoner's wilful neglect. The jury found prisoner not guilty, and he was discharged, the judge agreeing with the verdict.

EXCEEDING THE LIMIT.

The Earl of Annesley has been fined £6 and costs for driving in the Long Bennington police trap, near Grantham, at an alleged speed of 40 m.p.h.

At the Edgware police court four motorists have been fined sums ranging from £3 to £6 for exceeding the speed limit on the Harrow road.

A PROBABLE APPEAL.

Philip Paddon, 1, Albemarle Street, W., was summoned at the Kingston Court for exceeding the limit in Portsmouth Road, Thames Ditton. Mr. Staplee Firth defended. P.c.'s Beck, Davis, and Smith gave evidence in support of the summons, but, as none of them could identify the defendant, Mr. Firth submitted that there was no case to meet. Mr. Paddon did own a car, but it was not the number of the car stopped. P.c. Beck said "Paddon" was the name on the licence, and the driver said: "You had better make the address 1, Albemarle Street," by which he understood that he was not then living at the address on the licence. The Chairman (to Mr. Firth): Are you going to put defendant in the box? Mr. Firth: No. Inspector Brice: Do you say he is not the Mr. Paddon who was stopped? Mr. Firth: Prove your case. The Chairman said there was presumptive evidence that defendant was the man, and he ought to go into the box. Mr. Firth: I object to call him; you cannot convict on presumptive evidence in such a case as this. I know of a case in which a private card of mine was handed to the police at Huntingdon, by a motorist, and I was summoned. There must be identification clear and unmistakable. It may well be that some other person had got Mr. Paddon's licence. The Chairman: "We have decided to convict in this case, unless the evidence is rebutted. Mr. Firth: "You will take the responsibility for it; I shall most certainly appeal. It is the grossest injustice I ever heard in my life. I object to that, if it is intended to apply to my client in the case now before you, and having regard to the decision to commit in this case, I shall most certainly apply to the High Court for a writ of certiorari. I don't say it out of any disrespect to the Court, but I shall ask that the justices shall also

be compelled to pay the costs of my application to the High Court." The fine was £5 and costs.

A MOTORIST who was summoned at the Kingston County Bench on the 10th inst. for travelling up Kingston Hill at a speed estimated by the police at twenty-eight miles an hour has been fined £15 and costs, although there was no suggestion of danger to the public. It was mentioned that there were six previous convictions against him.

ON January 31st a police trap was established between Lewes and Brighton, which resulted in several motorists being convicted at Lewes on Tuesday, fines of £2 to £5 being inflicted in seven cases of exceeding the speed limit. Other motorists were charged with failing to produce their licences, but where it was found that the licences were actually in existence the charges were withdrawn on payment of costs.

ALLEGED OBSTRUCTION.

In the case in which Eugene J. Robertson, of Wandsworth, was summoned for obstructing the police at Putney by warning motorists of a police trap, Mr. Denman, at South Western Police Court, said that he did not think he could convict, but he would adjourn the hearing in order to prepare a written judgment, as the case was to be taken to the higher courts.

MOTOR-CAB LAW.

MR. H. R. WINTERTON attended before Mr. Plowden on behalf of the Fiat Motor-cab Company, at Marylebone Police Court on Saturday, and asked for a summons against a consulting surgeon in Harley Street

ROAD REPORTS.

HORSHAM.—No fewer than 42,000 square yards of roadway in the Horsham district have been selected for tar treatment during the next twelve months.

CHESHIRE.—At the last meeting of the Cheshire County Council Mr. W. L. Williams referred to recent experiments that have been made in the use of tar macadam as a preventive of dust upon the roads. Seven miles of road had been laid with the material at Liverpool, and it proved to be absolutely dustless and mudless, and its condition now was as perfect as when it was laid down. This was on a road over which there was heavy traffic, and he calculated that on an ordinary country road tar macadam would last for twenty-five years. There were 511 miles of road in Cheshire, and the County Council was at present spending £80,000 a year on road maintenance.

WHITBY.—The application for prohibiting the driving of motor-cars on certain streets in Whitby, which had been made to the L.G.B. by the County Council of the North Riding of Yorkshire, has been withdrawn.

ASCOT.—The tarring of the roads in the vicinity of the Ascot race-course is about to be undertaken by the Taroads Syndicate, Ltd., who have entered into a contract with some of the local authorities.

BACUP.—The existing tramway track along Market Street and Newchurch Road, leading from Todmorden, Burnley, and through Bacup to Accrington, will be unsuitable for motor traffic during the next six months, as it is to be taken up and new lines laid for a distance of about two and a half miles.

Motoring in India.

The above illustration depicts a view in Madras. On the left is seen the pavilion of the South Indian Motor Union, and on the right the garage of Messrs. Oakes and Co., Ltd.

for the recovery of 1s. 10d., the amount of a motor-cab fare. The driver of the cab, he said, was called from a stand in Regent Street to the address in Harley Street. When he arrived there the taximeter registered eightpence. After waiting a little time the surgeon entered the vehicle and directed the driver to proceed to Maresfield Road, Fitzjohns Avenue. When it reached the Marlborough Road Station, in Finchley Road, the cab broke down. The taximeter then registered 1s. 10d. Mr. Plowden: Don't you think the fare has a claim against you? Mr. Winterton: That may be in civil law. There are two stages in the transaction. It might be said there was a contract to proceed to a certain place, and as we have failed in the performance of our contract we cannot sue. Mr. Plowden: That is a common-sense view, I think. Mr. Winterton: But there is another stage. We were first told to drive to Harley Street, and were not bound to drive further. We have so many cases of the kind that my clients desire to make this a test case. It is a matter involving principle. Our claim is that immediately the meter registers that amount is due, and whatever happens on the further stage of the journey we are entitled to whatever the meter shows at the given moment. Mr. Plowden: Whether that is sound or not I do not know. Of course I am not expressing an opinion; my judgment is suspended. You may take a summons, and see what comes of it.

MAYFIELD.—The County Council has decided to make application for a speed limit of ten miles an hour through the village of Mayfield.

WEYBRIDGE.—The Surrey County Council have made an application to the Local Government Board for a ten mile speed limit for parts of Baker Street, Church Street, Bridge Road, Monument Hill, High Street, Balfour Road, and Portmore Park Road, Weybridge.

CLAYTON.—The Clayton Parish Council are asking the county authorities to apply for a speed limit of ten miles an hour on the well-known Clayton Hill, on the Brighton road.

TOOLS FOR MOTOR REPAIRS.

MESSRS. DRUMMOND BROS., LTD., of Ryde's Hill, Guildford, are showing at the Manchester Show one of their newly-designed 7½ in. high speed quick change screw and feed gear, screw cutting, sliding and boring lathes. This is provided with the firm's patent gap bed, by means of which the saddle can be brought right over the gap at any time without any overhang of tool or saddle. This lathe is fitted with a narrow guide, rendering it as suitable for precision work as for heavy work, and with the new boring table cross slide makes it particularly suitable for cylinder boring and the many other boring jobs in motor manufacturing or repairing. The lathe can also be reversed at saddle for screw cutting, and is so arranged that the threads cannot be crossed when cutting. The lathe is designed for motor repairing or heavy repairs in garages or bus yards.

THE firm of Renault Freres, the makers of the well-known cars bearing that name, will be in future carried on under the style of Louis Renault, M. Fernand Renault having retired from the business.

FORTHCOMING EVENTS.

FEBRUARY.

- 19th (F.)-27th (S.).—Manchester Motor Show at Belle Vue, Manchester.
 20th (S.).—First Annual Dinner of the Sutton Coldfield A.C.
 22nd (M.).—Manchester A.C. Dinner.
 23rd (Tu.).—Paper on Change Speed Gears will be read before the Incorporated Institution of Automobile Engineers.
 25th (Th.).—Irish A.C. Annual Meeting.
 26th (F.).—Hull A.C. Annual Meeting.
 Annual Meeting of the Motor Yacht Club.

MARCH.

- 1st (M.).—The Road Trials in connection with the Army Council Competition for light tractors commence.
 10th (W.).—The Sixth Ordinary General Meeting of the Incorporated Institution of Automobile Engineers will be held at 8.15 p.m. at the Institution of Mechanical Engineers, when papers will be read by Mr. G. H. Baillie, on "Carburettor Experiments," Mr. H. Ballantyne, F.I.C., F.C.S., on "The Chemistry of Petrol," and Mr. B. Blount, F.I.C., F.C.S., on "Specifying the Quality of Petrol."
 The meeting will be preceded at 8 o'clock p.m. by the Annual General Meeting of the Institution.
 18th (Th.).—Royal A.C. Annual Meeting, followed by Annual Dinner at the Covent Garden Theatre.
 20th (S.)-27th (S.).—Cordingley's fourteenth Annual Motor-Car Exhibition and Mart and third Aero Show at the Agricultural Hall, London, N.

APRIL.

- 10th & 12th.—Easter Meeting at Brooklands.
 24th (S.).—Auto-Cycle Union's Quarterly Trial.
 29th-30th.—Road Conference in London of the County Councils Association.

MAY.

- 26th-June 1st.—Irish Reliability Trials.
 31st (M.).—Whitsuntide Meet at Brooklands.

JUNE.

- 10th-18th.—Prince Henry Touring Trophy Competition.
 14th-19th.—Scottish Reliability Trial.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE business carried on by Messrs. Burgess and Harvey, Ltd., has been acquired by Messrs. W. J. Harvey, Ltd., a private company with a capital of £10,000 and registered offices at 463, Oxford Street, London, W.

THE Pneumatic Tyres, Ltd., is the title of a private company which has been registered with a capital of £100 to deal in pneumatic tyres for motor vehicles.

THE Motor Repairs and Accessories Syndicate, Ltd., has been registered with offices at 86, Cannon Street, London, E.C. It has a capital of £5,000 and has been formed to acquire the plant, machinery, tools and stock in trade of Argylls, London, Ltd., and to adopt an agreement with Mr. A. Clark.

WITH a capital of £2,000 the Ealing and Acton Motors, Ltd., has been registered to carry on business as motor-car manufacturers and agents. The registered offices are at 11, King's Parade, Acton, W.

AN extraordinary general meeting of Humber (Limited) was held at Coventry on Tuesday for the purpose of confirming the special resolutions passed at a previous meeting for the reconstruction of the company. Under the scheme the new preference shares are subject to a call of 3s. 6d. each, but four shares in the new company are to be given in place of three, and the ordinary to a call of 4s. 8d. Mr. E. Powell (chairman) presided over the meeting, and Earl Russell moved the confirmation of the resolutions. This was seconded by Mr. D. Basden, who said that the new company would have a working capital of between £300,000 and £400,000. The stock-in-trade, book debts, and cash, according to the last printed balance-sheet, amounted to £288,000. To that would be added the proceeds of the calls on the shareholders, which brought the figures to £414,000. Arrangements have been made for the £150,000 advanced on debentures to stand, and that was not to be paid off; consequently the £400,000 was available as working capital, less the ordinary trade liabilities which were naturally on the books at all times. The resolutions were unanimously confirmed. Under the scheme the new board will consist of Lord Russell, Major Ashworth, and Messrs. D. Hasden, Ballin Hinde, J. W. Davy, and W. B. Jessop, the last-named two being members of the present board of directors.

THE East London Rubber Company are removing from Shoreditch to more commodious premises at 29-31, Great Eastern Street, E.C.

PUBLIC SERVICES.

MR. HUNTER, of the Dewsbury Motor Garage, who has had three motor-cabs plying in Dewsbury for some time, has now been granted licences for similar vehicles for Batley.

THE Keighley Town Council have recently been running a motor-bus between Eastburn and Utley as a feeder of the tramway system, and, satisfied with the result of the test, the Tramway Committee have now obtained the Council's authority to buy two motor-buses of the char-a-banc type at a cost of not more than £755 each.

THE Liverpool Dock Board has arranged to give permits, through the Harbour Master, for the drivers of motor-cabs wishing to take their vehicles on the dock estate.

THE affairs of the Vanguard Motor Omnibus Company have lately been before the Court. On the petition of Col. Mayhew, Major Rhodes and other gentlemen, Justice Swinfen Eady has made an order that the voluntary winding up is to be continued under the supervision of the Court, and that the agreement to sell the undertaking of the Vanguard Motor Omnibus Company to the London General Omnibus Company should be sanctioned.

THE East Ham Town Council have requested the police authorities to require the motor-buses to select stopping places other than those used by the trams, as this has proved a source of danger to vehicular and pedestrian traffic.

SEVERAL reductions in the motor-bus fares in the Metropolis have been made by the London General, Road Car, and Vanguard Omnibus Companies, which are now in combination. It is understood that with the inauguration of the summer service several of the routes will be extended.

"POLICE CONTROLS."

IN the Mitcham Lane, Streatham, between the cricket field and the King's Head Hotel, the police have a trap in frequent operation.

THE police traps on the Great North Road, near Grantham, have been in frequent operation of late; one is over a stretch of four miles between Great Gonerby and Long Bennington, another between South Witham and Colsterworth, and a third between the latter place and Great Penton.

AUTOMOBILE ACCIDENTS.

AT Kilburn, on Monday, an inquest was held concerning the death of a boy run over by a motor-omnibus. The witnesses deposed that the deceased and two other lads were playing with a dog on the roadway and that the driver of the motor-bus could not avoid the accident. The jury returned a verdict of "Accidental death," exonerating the driver from blame.

A DISTRESSING motor-car accident, in which six children were involved, took place on Saturday at the village of Ashford, on the main road between London and Windsor and about two miles from Staines, at a point which Dr. Maurice Cook, the medical officer of the Staines Infirmary, regards as a very dangerous highway, where the police authorities should take stringent precautions in order to safeguard the safety of the public. The children were playing in the road throwing each others' caps about when the driver of a car belonging to Mr. Stanley Brotherhood, trying to avoid one of them, struck into the group of five, with the sad result that one received such injuries that he died a few hours afterwards and of the others two are not expected to recover.

MR. HUGH DONALDSON, residing in Edinburgh, has just died as the result of an accident near Sanquhar, Dumfriesshire. The deceased gentleman was motoring to Edinburgh from Thornhill, and at Orchard Bridge on Friday of last week, where the road resembles the letter "s," he is reported to have lost control of the car, which crashed through a fence and toppled down an embankment of twenty feet. Mr. Donaldson's back was broken. A friend, who jumped out, had a narrow escape.

A YOUNG cyclist died at Southend Hospital on Monday from injuries received by colliding with a motor-car at Hadleigh on Saturday.

BUSINESS NEWS.

FROM the Jackson Automobile Company, of Jackson, Mich., U.S.A. comes a copy of the 1909 catalogue of Jackson cars. Four models are being turned out of respectively 15-18-h.p., 20-24-h.p., 30-h.p., and 36-40-h.p., the first two being fitted with horizontal double-cylinder engines, and the more powerful cars with four-cylinder motors of the vertical type.

THE Sheppey Motor Company, York, send a copy of their latest catalogue of specialities for steam cars. These comprise engines, generators, feed pumps, regulating valves, and other fittings for use in connection with superheated steam. The firm have also lately introduced a new steam chassis adapted to be fitted with char-a-banc or lorry bodies.

OWING to a similarity in names there has been a certain amount of confusion between the London and Parisian Motor Co., Ltd., and the London and Paris Exchange, now in liquidation. The London and Parisian Motor Co., Ltd., of 87, Davies Street, Oxford Street, W., who deal in motor-cars and accessories only, have not, nor have they at any time had, any connection with the London and Paris Exchange.
